France's Industries Rise From Their Ashes

Not Enough Men in Country to Meet Demand for Manufactured Goods

By ALLAN L. BENSON

REVOLUTIONARY changes are taking place in France. France is turning from agriculture to industry. Her great capitalists, by a process of peaceful penetration, are finding markets for French industrial products in what may be called the French satellite countries—Rumania, Czecho-Slovakia, Yugo-Slavia and Poland.

At the moment, the change seems to be bringing good results. In England, twenty miles across the Channel, a million men or so are out of work. In France there are not enough men to produce the manufactured goods for which French capitalists have found markets. Every Frenchman out of military service is employed. France is even going into nearby countries to get help. An average of 7,000 workingmen a month are coming into France. Most of them come from Italy. Some of them are skilled and some are not. France has use for both kinds.

In short, while the French Government is bankrupt, the French people are prosperous. But they are gaining their prosperity in the same way that England lost it. A hundred years ago, England turned from agriculture to industry. She gained great riches. She continued to prosper until her foreign customers learned how to manufacture things for themselves. Now England is in distress because she cannot find enough foreign markets to keep her people busy. And her distress is increased by the fact that her agriculture has so declined that she raises but 25 per cent of her food.

Conquering the Markets

FRANCE, who for centuries has raised all of her food, is now going to trust to luck for what she wants to eat and become a manufacturing nation. What will happen to her when her satellite nations learn how to manufacture things for themselves may be learned by looking across the Channel at England.

One of the most remarkable phases of French industrial and economic development since the war is its systematic acquisition of one new market after another. In each case the operation was begun by the acquisition of a bank in the country concerned, after which railways, canals, docks, ports, factories and foundries rapidly came under control of French financiers.

Each of the great French steel corporations now has ramifications all over Central Europe, not only in its own industry, but in many subsidiary and in some totally dissimilar industries.

The case of M. Schneider is highly illustrative. M. Schneider—a Frenchman in spite of his Germanic name—is the head of the famous Creusot steel works, which was famous before the war as the greatest munition factory in Europe and is now making steel rails as well as tanks, heavy artillery and machine guns.

Schneider has gone out boldly to conquer the markets of Czecho-Slovakia. He began by founding a bank. With the aid of two great French banks, the Bank de l'Union Parisienne, of which he is a director, and of the Credit Lyonnaise, Schneider established a corporation called the European Industrial and Financial Union. The function of this concern was to protect and administer the future interests of the Schneider group in Eastern and Central Europe.

This corporation bought a controlling interest in the Zivnostenka Banka which was and remains the chief financial establishment in Czecho-Slovakia. As a bank of deposit, a bank of investment and as a holding company it has completely taken the place of the great pre-Armistice banks of Vienna.

This bank, being legally and nominally Czecho-Slovakian, and enjoying, moreover, the diplomatic protection of the French Government, is recognized and protected by the government of Czecho-Slovakia, and thus enjoys a virtual monopoly of the banking business of that country.

Increase in Industrial Activity

THE Zivnostenka Bank has gained control of the Bank d'Escompte of Bohemia and the Prague branch of the Kredit Anstalt. It soon forced an agreement upon the Credit Foncier d'Autriche which put the last-named bank out of the running in a number of industrial enterprises in which the Schneider group was interested. This agreement gave Schneider, through this same bank, control over the textile industry of Czecho-Slovakia, the sugar industry and the manufacture of alcohol.

In the steel and metal industry, which is Schneider's chief interest, the possession of this bank and its associated financial institutions gave this French steel king control over the blast furnaces of Poldi, the Rustan works, the iron mines of Paukrac, the mines and foundries of Moraska Ostrava which formerly belonged to the Archduke Frederick of Austria, of the Iron Industrial Company of Prague, and finally and most important, of the world-famous Skoda munition works.

Schneider figures personally among the administrators of the Skoda munition works, in company with two of his henchmen, M. Victor Champigneul and Colonel Henri Veil. Thanks to the millions of Schneider and the Creusot munition works, the capital of the Skoda enterprise has been increased from 72,000,000 Czech crowns to 20,000,000 crowns; and Skoda has recently absorbed the great amalgamated machinery-making concerns of Rustan, Bromowski and Ringhoffer.

Schneider's other recently acquired interests in Czecho-Slovakia include oil, electrical power, coal, chemical products, agricultural machinery, life insurance, and even the collection and distribution of milk and the manufacture of soap and candles.

The general increase in industrial activity in France since 1913 may be seen from the following astonishing figures:

Total value of French exports in 1923	14,161,000,000
Total value of French exports in 1913	3,372,000,000
Increase in 10 years	10,789,000,000

The following figures, which are official, show the increase in industrial activity in France over the period 1913-1923. The leading industries are taken in turn, and detailed figures show the amounts produced and exported.

Coal, Anthracite, Lignite, Coke	1913—Tons	1923—Tons
Output	40,844,000	47,800,000
Imported	65,208,000	40,200,000
Exported	1,304,000	.....
Consumed	63,904,000	88,000,000

Comparative Hydraulic Power

Horsepower available in 1913, 750,000; in 1923, 1,600,000.

Iron Ore	1913—Tons	1923—Tons
Output	21,918,000	26,012,000
Pig Iron		
Output	5.207,000	6,200,000
Iron and Steel		
Output	5,093,000	8,329,000
Exported	477,000	2,136,000
Raw Copper		
Output	15,000	25,000
Sheet Copper and Brass		
Output	31,622	65,500
Exported	5,502	10,000
Copper and Brass Bars		
Output	21.231	40.500
Exported	4.873	6,000
Copper and Brass Wire		
Output	48,950	62,000
Exported	14,678	17,000
Copper and Brass Tubes		
Output	7,500	25.000
Exported	2,000	12,000

The foregoing figures indicate the great industrial gains that were made by France during the first ten years following the outbreak of the war. They are in fact *gains made since the Armistice,* since there were only losses during the war.

Speeding Ahead

WE SHALL now see some figures that prove that France is speeding ahead at a constantly increasing gait. She is gaining more rapidly in 1924 than she did in 1923 or in any other year since she began to press her industrial development.

Look at these startling figures:

Exports during first third of 1924	Francs	Increase over 1923 Francs
Chemical products	484,269,000	242,340,000
Glass and earthenware	114,660,000	40,682 000
Thread	600 078,000	336,891,000
Manufactured cotton	977,547.000	597,264,000
Manufactured wool	932 648,000	549,234,000
Manufactured silk	1.948,953,000	426 542,000
Gowns and underwear	1,247,657,000	676.805,000
Stationery	292 531,000	27,965 000
Iron and steel	804,215.000	320,757,000
Copper	108,847,000	48,783,000
Dressed skins	254,509,000	162,523.000
Leather goods	150,011,000	68,508 000
Dressed furs	218,275.000	114,995,000
Jewelry and watches	66 241.000	7,019,000
Machinery	378,858,000	139,843 000
Metal work	405 537.000	155,482,000
Wood work	55,886.000	19,712,000
Rubber goods	279,234,000	101,884 000
Automobiles	436,911,000	217,627.000
Luxury articles	181,269,000	66,039,000

One can see from these figures why there are no idle men in France. But a different set of figures is required to show what is happening to French agriculture. Nothing more certainly indicates the decline of agriculture in a country than an increase in the amount of land devoted to pasture. The natural grasslands of France have increased from 4,829 000 hectares in 1913 to 5,068,000 hectares in 1923. Pasturage and sown grass lands have increased from 5,194,000 hectares in 1913 to 5,812,000 hectares in 1922. And with this increase in pasture has come a decrease in the amount of land devoted to breadstuffs. The following table shows how much less wheat and rye France is raising:

	Wheat Hectares	Rye Hectares
1913	6,542 000	1,176,000
1914	6,060,000	1,058.000
1915	5 489,000	935,000
1916	5 030,000	870.000
1917	4 191,000	742,000
1918	4,449,000	706,000
1919	4,604,000	772 000
1920	5,094,000	869.000
1921	5,382,000	901,000
1922	5,290,000	888,000

When the war broke out, the amount of land devoted to agriculture naturally declined. The decline continued throughout the war. After the Armistice, progress toward recovery is noted. But the progress stopped in 1921. The next year marked a slump. Men cannot work in two places at the same time. As French industry is developing, French agriculture is declining.

There can be no doubt whatever that agriculture in France, despite the prosperous appearance of the most highly cultivated agricultural regions, is on the decline. A writer in the serious and well-informed newspaper, *La Journee Industrielle,* in a series of long and well-documented articles on the agricultural crisis in France, recently dealt with region after region which, before the war, were prosperous agricultural districts. In each of these districts, the price of land, all allowance being made for the depreciation of the franc, had fallen considerably. Large areas had degenerated from rich arable land into pasturage. Many houses and farm buildings which, less than a generation ago, were occupied, had fallen into disuse and some into ruin. Farm labor is almost unobtainable and, notwithstanding the housing shortage in France, the offer of a good cottage and a well-stocked kitchen garden to a farm laborer fails to induce him to work on the land. Even the peasants' sons and daughters prefer to work in factories, offices or even in kitchens than remain in the dull, laborious, semi-independent conditions of the parental farms. The same sons and daughters when, by the French laws of inheritance, they come into the possession of the farm at the father's death, generally sell out their portion of the inheritance to a more conservative brother or to a neighboring farmer.

Finding Outlet in Colonies

FRANCE has been helped in the industrial competition in Europe since the war by two factors: first, by the great increase in industrial machinery made necessary by the war; second, by the rebuilding of the devastated area and the building, in many instances, of better factories than the Germans destroyed.

The region around Lille and Rubaix, for example, which in 1918 was a wilderness, is now studded with immense concrete factories and mills. This region is now better equipped for production than ever before, and is underselling Bradford and other textile centers in the world market. During the last two years, English woolen manufacturers have been ousted from their eminent positions in the woolen trade. The depreciation of the franc, together with the embargo on German exports, has also given French industry a preferential in all Europe and in many markets outside of Europe.

Since the war France has realized the commercial utility of her colonial possessions. Northern Africa has now become a vast market for the absorption of France's industrial energy. In Morocco, which has been amazingly transformed during the last ten years under the administration of General Lyautey, vast buildings have sprung up. Of concrete and steel construction, many of them contain 100 offices each, a motion picture theater and two or three barber shops.

Indo-China is another outlet for the surplus products of French factories, the value of which has been realized only since the war. Enterprising French automobile manufacturers recently organized an expedition of tractors across the Sahara Desert with a view to demonstrating not only the efficiency of French automobiles but the commercial possibilities of the North African continent which had hitherto been considered a worthless desert.

The French nation as a whole has not yet realized the significance of these developments, nor do the majority of the politicians, but here and there a politician of the younger school, like Gaston Vidal, appears to know what is going on. M. Vidal was the minister for technical education in the first Poincaré cabinet. While in office he went energetically about it to build up the schools for technical education. His theory is that France is destined to become the workshop of Europe, but he realizes that a nation of less than 38 000,000 cannot furnish the labor power for a national factory such as he expects France to become. His plan, therefore, is that the French shall become the foremen, the skilled workmen and the craftsmen. The unskilled labor, as in America, will be recruited from the indigent populations of other European countries, chiefly Poland, Czecho-Slovakia, Italy and Belgium.

Immigration of Unskilled Labor

THIS immigration of unskilled labor has already begun. Before the war it was the custom of Italian peasants to cross the Alps into France to work during the grape-gathering season, and to return to Italy, once the harvest was gathered. Now unskilled Italians are coming to France in increasing numbers and for other purposes. Most of them remain in France.

Polish laborers enter France daily by sea from Danzig to work in the mines and foundries of the north or the textile mills of Lille. Many Belgian foundrymen and mechanics are also coming to France. The latest immigration is a number of Russian soldiers who served in the army at Wrangel, hungry and disillusioned after their exile in Bulgaria and Turkey. Thus swells the foreign army of unskilled labor, working under skilled French direction in French factories.

France is now at the head of the airplane industry of the world. French airplanes fly daily from Rumania, Poland, Spain and Russia. The airplanes which dropped Spanish bombs upon the rebellious Riff tribesmen in the

(Concluded on page 11)

One of the Most Famous Hilltops

Gad's Hill Rich With Dickens's Memories And Reminiscent of Falstaff's Exploits

By W. TEIGNMOUTH SHORE

Sir John Falstaff Inn, Gad's Hill.

KENT is one of the most lovely and historically interesting of English counties, and therein is Gad's Hill, one of the most famous hilltops in the world. And which man would you prefer to meet there? Sir John Falstaff or Charles Dickens? Let us meet them both; that is best.

The highway leading from Gravesend on the Thames to Rochester on the Medway, and thence to Canterbury and Dover, is typically Kentish; it runs between rich hedges and sweet green fields; through old-fashioned towns and quaint villages with homely, gray churches; there are hop fields; well-wooded parks and ancient houses, and a plenty of wayside taverns, at one of which we will call before we part.

As we walk from Gravesend, having come some miles upon the way, lo! upon our right hand, standing a little way set back from the roadside, is a pleasant, comfortable house; a red-brick building, set up in the year 1779 by a well-to-do brewer, who desired to pass his latter days in dignified leisure; bay-windowed; with a formal porch with pillars and stone steps; and atop the roof a rather skimpy bell turret. A house that never would have been known to the world at large had it not been the home of Charles Dickens from the year 1857 till the day of his death. The red-brick frontage is curtained with ivy and Virginia creeper; back and front the trim gardens are ablaze in summertime with gay-colored flowers, such as Dickens greatly loved. He had a veritable passion for high colors, which he often indulged even in his clothes. Whenever possible the two beds at the front of the house would be filled with scarlet geraniums, which were his favorite flowers. Gad's Hill Place is not in itself very rural, but is set amid a beautiful countryside: "Cobham Woods and Park are behind the house; the distant Thames in front; the Medway, with Rochester, and its old castle and cathedral, on one side. The whole stupendous property is on the old Dover road . . . ." whereon, as we are told elsewhere, there are milestones!

Gad's Hill Place.

Dickens added to the house very considerably, and made many alterations; indeed, it was a matter of jest against him by his family that he was always at it. One of the bedrooms was made into a study, but usually he worked in the library on the ground floor, the room to the right of the porch as we look at the house, and of his writing table there his son-in-law, Charles Allston Collins, brother of Wilkie, has given us some details: "Ranged in front of and round him were always a variety of objects for his eye to rest on in the intervals of actual writing, and any one of which he would instantly have missed had it been removed. There was a French bronze group representing a duel with swords, fought by a couple of very fat toads, one of them (characterized by that particular buoyancy which belongs to corpulence) in the act of making a prodigious lunge forward, which the other receives in the very middle of his digestive apparatus, and under the influence of which it seems likely that he will satisfy the wounded honor of his opponent by promptly expiring . . . . and the little fresh green cup ornamented with the leaves and blossoms of the cowslip, in which a few fresh flowers were always placed every morning—for Dickens invariably worked with flowers on his writing table . . . ."

He built on a drawing room, and a conservatory, "brilliant but expensive," which he announced as "*positively* the last improvement"; which fate ordained that it should be.

What impression would this house have made upon one? There is an atmosphere of orderliness, almost of super-neatness; and though the furniture has not yet gained the dignity of the antique, it certainly has now an Old World air. It belongs to an age that knew not many of the comfortablenesses that we now enjoy. In a word it was Victorian.

Dickens was without a doubt lord and master in his own house, impressing his personality, his likes and his dislikes upon it. He loved looking-glasses; so there were looking-glasses all over the place! Orderliness was in his blood, so his home and all its ways were orderly. He hated unpunctuality, so everyone that dwelt with or visited him had to be utterly punctual.

We go in by the heavy gate that is one of two giving entrance from the highroad, and so along the semicircular carriage drive up to the aforesaid porch, or rather portico. The entrance hall, square and spacious, runs from front to back of the house, and at the farther end is a door opening to steps that lead down to a lawn, which is divided by a stone wall from the open field beyond. In the hall we note a big letter box, with the hours of the outgoings of the mail painted thereon. On the right hand are the library and the billiard room; on the left, the drawing and dining rooms, all well-favored apartments. Hung in the hall are a fine set of Hogarth prints and paintings by Stanfield.

Had we had the good fortune to have been the guests of Charles Dickens, we should soon have found that comfort reigned supreme. After breakfast at nine or ten o'clock or so, we should have been left to do as we pleased with the remainder of the morning, unless, as was often the case, there was some special jaunt on hand; the while the master of the house devoted himself to whatever work he was engaged upon. Then luncheon at half-past one; then a walk or a drive, or some sport in the garden, such as a game of bowls or croquet. Dinner, which was always a festive feast; and so on till bed time, which might be a late hour of night or an early one of the morning, if you were a "gent" and found your way with other "gents" to the billiard room; though the master himself would always retire at a reasonable time. And the bedrooms! Comfort *in excelsis!* In each a sofa, an armchair, a goodly writing-table, with a plentiful supply of quill pens, freshly cut; books; and in winter time a generous fire and a bright copper kettle; and—what delight!—a teapot, tea caddy, cups, saucers, sugar and milk! A noble example, that should be more often honored than it is in these degenerate days. He knew how to make himself cosy and comfortable, and saw to it that others were so, too. Good fellowship!

What delightful gatherings there have been in this house; welcome guests from America not a few. What pleasant junketings; what good talk, what laughter, what proper soberness on occasion.

There are many famous people whom we should have enjoyed meeting there. We must content ourselves with shaking hands with one; with Hans Andersen, who paid a visit to Dickens in the summer of the year 1857. "Before me," he writes, "lay on the broad highroad Dickens's country house . . . .As I entered the house Dickens came to meet me, so happy, so cordial; he looked somewhat older than when we parted ten years before, but this was partly owing to the beard he wore; his eyes glistened as formerly, the same smile played round his mouth, the same clear voice sounded so cheerily . . . .I cannot find more characteristic words to describe him than a quotation from the first letter I wrote home. 'Select the best of Charles Dickens's works, form from them the image of a man, and you have Dickens.' Just as he stood before me in the first hour, he remained unchanged during all the weeks I passed with him, ever jovial, merry, and sympathizing."

Going again into the front garden, we make our way under the road through a tunnel, constructed by Dickens, to the shrubbery on the other side in which was erected the Swiss chalet given to him by his friend Fechter, the actor. Need it be said that Dickens be-mirrored it? "I have put five mirrors in the chalet where I write," he tells us, "and they reflect and refract, in all kinds of ways, the leaves that are quivering at the windows, and the great fields of waving corn, and the sail-dotted river. My room is up amongst the branches of the trees; and the birds and the butterflies fly in and out, and the green branches shoot in at the open windows . . . ." In this room he wrote the last, but not, alas, the final words of "Edwin Drood."

When Holman Hunt, the painter of "The Light of the World," was staying at Gad's Hill Place in 1860, he and his host got into talk about Shakespeare. In reply to the question what was his favorite passage in the play, Dickens spoke of the visit paid by Sir John Falstaff to Mr. Justice Shallow, with Mr. Justice Slender added to the party . . . ."As I read I can see the soft evening sky beneath the calm twilight air, and I can smell the steaming pippins as they are brought on to the table, and when I have ended my reading I remember all as if I had been present, and heard Falstaff and the whole company receiving the news of the King's death."

I believe Dickens had a soft place in his heart for this fat, knavish knight, and in my mind's eye can see him as he walks along the road of a nighttime accosting the shade of Sir John and those of his rascally companions on the hill. In the entrance hall of the house, handsomely illuminated, hung this quotation from Henry IV: "But, my lads, my lads, tomorrow morning, by four o'clock, early at Gadshill! there are pilgrims going to Canterbury with rich offerings, and traders riding to London with fat purses; I have vizards for you all; you have horses for yourselves."

Pious pilgrims no longer go upon their way to make their prayers and lay their offerings at the shrine of Saint Thomas a Becket in Canterbury Cathedral; rich merchants now roll by in autos and dispatch their goods by train. Those olden days were picturesque, but not altogether pleasant, nor very comfortable.

Turning to the right as we leave the house "a little rustic alehouse, called the Sir John Falstaff, is over the way," wherein we will stay awhile to refresh and to ponder o'er the past; to dream of the days that are no more. The road before the inn is busy with motor cars rushing swiftly by with unmusical hootings; I like to think of the melodious tootings of coach horns along this great road between London and Dover, when it was alive with mail coaches and with the private carriages of rich travelers posting on their way to, or from, the Continent, though I do not desire to share their terror of the highwaymen who used to infest this road. There are still plenty of beggars and tramps, sturdy and otherwise, gypsies sometimes, tinkers, costermongers and quite a few wayfarers on Shanks' mare. Dickens, himself a bit of a tramp at heart, when walking along this road, Rochester way or toward town, met with many a tramp, male and female, old and young, and has introduced us to some of them in a paper in "The Uncommercial Traveller."

Let us be tempted, and fall to the temptation, to go with him for a walk that he has described in his first story, "Pickwick Papers," which was the last walk that he himself took, through Cobham Park to Cobham village, where Mr. Pickwick found the broken-hearted but not altogether dead-to-the-world Mr. Tupman. Often have I gone along this delightful country way, even in the broadest daylight feeling as though the shade of cheery Charles Dickens was walking by my side.

Cobham Hall is the seat of the Earl of Darnley, and has been in the possession of the family, or at any rate of a family of the same name, since the days of King John. Many royal guests have there been entertained; Queen Elizabeth, of course, and Charles the First and his queen, Henrietta Maria, riding to London after their marriage at Canterbury.

And so to Cobham village, and farewell to Gad's Hill.

Cobham Hall.

Republicans Allege Attack on Constitution

(C) Harris & Ewing

CALVIN COOLIDGE.

President Coolidge and His Running Mate Cite "Dangerous Age"

By WILLIAM M. BUTLER

CHAIRMAN, REPUBLICAN NATIONAL COMMITTEE

THE importance of this campaign outstands any national contest which we have had in two or more generations. We have had tariff and hard money campaigns in the periods I have in mind which have seriously threatened to disturb, disarrange and complicate our economic life, but this is a campaign which threatens our Constitution, our existence as a nation.

Here is a campaign in which we have three political parties and four presidential candidates. A campaign in which the leaders or certain groups of the electorate are deliberately seeking to prevent the people from electing a president at the polls that they may selfishly select one of their number in Congress.

There is hardly a phase of our national life—economic, cultural, legislative and constitutional—but is being attacked. Not only are our civil rights being made the object of assault, but our God-given rights in the Declaration of Independence are made a matter for argumentative dispute.

I am now satisfied the people at large fully sense how much they have at stake. They appreciate that the attack on the Constitution as proposed by the third party puts at once in jeopardy the right to trial by jury, the right of freedom from unauthorized search, the right of person from unauthorized seizure, the right of public speech, of freedom, or religious worship. These are rights specifically guaranteed in the Constitution which the third party seeks to destroy by making the decisions of the Supreme Court subject to revision and control by Congress.

The government ownership of railroads has been made an issue. I will not discuss that subject by and large. I will simply call attention to one phase which I believe is not completely understood as matters stand today: The railroads of the country yearly pay an enormous total of money in the form of taxes into the local city, town and county treasuries—some three hundred million dollars.

Under government ownership railroad property would become nontaxable. This revenue would cease. Yet the municipalities and counties have already built up annual budgets based on the steady receipt of this revenue. The bills would have to be met and they could only be met by levying additional taxes to produce a sum of money equal to what the railroads are now locally paying. Do you appreciate what that would mean? A loss of more than eight and one-half million dollars on taxes to the State of Minnesota, of seven and one-quarter million dollars to Wisconsin, of approximately seven millions to Iowa, and so on down the list.

It would mean an additional tax of $40 for every farm in Minnesota, $52.40 for every farm in North Dakota, $81.25 for every farm in Montana. Every state in the Union would lose. I could multiply many instances of how this election result will actually touch all the people all of the time.

The election of Calvin Coolidge has been forecast in many ways, though I will not attempt to go into any examination of those forecasts at this time. Our campaign is not only to elect Mr. Coolidge, but to accomplish it with so large a popular vote that once and for all there will be no misunderstanding of the attitude of the American people on these vital questions.

We are expecting a vote so large that the verdict will stand unchallenged and will lay forever the specter of the destruction of the Constitution and the rights of the people to enjoy what they earn.

In the management of this campaign I am viewing with satisfaction the work of the women. The Republican party welcomed them to its platform with the pledge that they were to be received into full fellowship; not as mere assistants but as coworkers. They have taken that pledge, and have done, and are doing a man-

(C) Walinger, Chicago

CHARLES G. DAWES.

size job the country over. In the matter of registration they have stood in line with equal, if not greater, patience than the men, and oftentimes at a greater sacrifice.

They have taken up the task with a fine appreciation of the responsibilities. They have given to the men a double sense of the importance of sincerity in political life. Their hearty participation in the actual details of political organization has operated to increase the standard of fitness of candidates for public office. From the women we are expecting a high record of performance on election day.

In Calvin Coolidge the Republican party is presenting a candidate justly deserving the confidence which the people have reposed in him. There is no need for me to attempt any eulogy of his character. It is understood by the people. In this, "The Dangerous Age," the nation needs him. It needs his spirit of service, unselfish in every way. It needs his spirit of frugality; his high appreciation of the responsibilities of public office. It needs the typical Americanism which he personifies.

I have no comment to make on the other candidates. I am speaking only of our candidate—Calvin Coolidge. His election means security in our nation.

This is not the year to waste a vote. The issues and the times are too important.

Progressives Submit

Ask for Support on

By JOHN M.

NATIONAL MANAGER, LA FOLLETTE-

THE supreme purpose of the campaign now being conducted in support of Robert M. La Follette and Burton K. Wheeler, as the Independent Progressive candidates for President and Vice-President, is to "drive monopoly and special privilege out of control of government and restore it to the people."

Wall Street's control over the government of the United States is not a campaign phrase; it is a stern reality. It need not be demonstrated. Its existence and its corrupting influences are known to every reader of THE DEARBORN INDEPENDENT. The repeated exposures of graft and corruption in various departments of the Federal Government during recent years do not begin to reveal the extent to which predatory wealth has used its control to promote its selfish interests.

Fall, Daugherty and Forbes do not stand alone. Other high officials have betrayed the public trust and should be removed. There are scandals in connection with the Shipping Board, the Alien Property Custodian's office and the settlement of war contracts and railroad claims, which exceed in magnitude if not in venality the evils disclosed in the Department of the Interior, the Department of Justice and the Veterans' Bureau. The henchmen of special privilege and corrupt business are still holding strategic official positions and will not be driven out until the entire system that has been built up under successive Democratic and Republican administrations is destroyed.

The first pledge, therefore, of La Follette and Wheeler, the Progressive candidates, is for clean government. They propose a complete house-cleaning in the Department of Justice, the Department of the Interior and the other executive departments.

Everybody knows that they would carry out this pledge. That is the fundamental basis of the bitter and unscrupulous opposition now directed against them. That is why every resource is being exhausted to "frame up" a charge against Senator Wheeler, the man who exposed the "Ohio gang" and drove Harry Daugherty from office.

The Progressives do not believe, however, that it is sufficient merely to drive corrupt officials out of the government. That is only a first step. Constructive legislation to safeguard and promote the public interest is absolutely necessary. Even with the most honest and efficient enforcement of the laws that are still on the statute books, private interests would still enjoy unwarranted special privileges and the people would suffer.

Let us take the transportation situation, for example. As long as the Esch-Cummins Law remains on the statute books there can be no substantial reductions in railroad rates for freight and passengers. This was made absolutely clear in the recent decision of the Interstate Commerce Commission in the grain rate case.

For more than twenty months the farmers of the corn and wheat states had been appealing to the Interstate Commerce Commission for a decrease in freight rates on grain. They proved that the freight rate on corn, wheat and other grains was nearly twice as great in proportion to the market price as it had been prior to the war. They proved that the efficiently managed railroads of the grain belt were

(C) Harris & Ewing

ROBERT M. LA FOLLETTE.

literally rolling in wealth and had piled up huge surpluses even on their own accounting. They showed that to conceal their real profits, the railroads of this section were making exorbitant and unreasonable allowances for maintenance and depreciation. Finally, they demonstrated that these freight rates were literally bankrupting huge areas upon which the nation is dependent for its food.

After carefully considering all this evidence for a period of nearly two years, a majority of the commission finally handed down a decision in which they stated, in substance, that a reduction in grain rates was impossible because the existing rates were not high enough to give the railroads of this territory *as a group* the 5¾ per cent guaranteed them by the terms of the Esch-Cummins Law. As a matter of fact, the 5¾ per cent which the Esch-Cummins Law provides for the railroads is actually 6.57 per cent, because the Interstate Commerce Commission, of its own volition, has held that the net return to the railroads must be figured *after* the deduction of Federal taxes. Since the average interest paid on bonds by the railroads, as officially stated by Senator Cummins, is only 4.3 per cent, this allowance of 6.57 per cent by the Interstate Commerce Commission means a practical guaranty of more than 8 per cent on the stock, including all the water that has been poured in by generations of "frenzied finance."

In contrast, the official report of the U. S. Secretary of Agriculture, dated August 25, 1924, shows that on the capital loaned by farm operators the rate of profit was *minus* 3.1 per cent (loss) for 1920, *minus* 1.4 per cent (loss) for 1921, 1.5 per cent (profit) for 1922, and 1.4 per cent (profit) for 1923. "Thus," says the Secretary of Agriculture, "in two out of the five years farmer-owned capital earned nothing and had to be drawn on to

Democrats Indict Government's Record

(C) Champlain Studios, N. Y.

JOHN W. DAVIS.

Democratic Nominees Severely Criticise Present Administration

By CLEM L. SHAVER

CHAIRMAN, DEMOCRATIC NATIONAL COMMITTEE

JOHN W. DAVIS and Charles W. Bryan should be elected in November because no other candidates or party offers the country the means through which it can regain the twin ideals it has always cherished:

Honesty and progress at home and honor abroad.

The Republican party under its present leadership has forfeited all claim to consideration of its appeal that it again be intrusted with the duties and responsibilities of conducting the government. It has failed miserably in its obligations during the period that the government has been in its hands. Not only that, it has permitted men high in its councils, in positions of responsibility next to the Presidency itself, to graft, loot and plunder.

At the same time it has shown utter incapacity to deal with industry and agriculture, and disinclination to move forward along lines of social betterment. Under the Harding-Coolidge Administration the farmers of the country (and the thousands of persons in business dependent upon them) have been subjected to the worst panic in the history of the nation. Six hundred thousand farmers have gone bankrupt since 1921, or one in each four west of the Mississippi.

During the same period the other three-fourths have been reduced from prosperous to difficult circumstances.

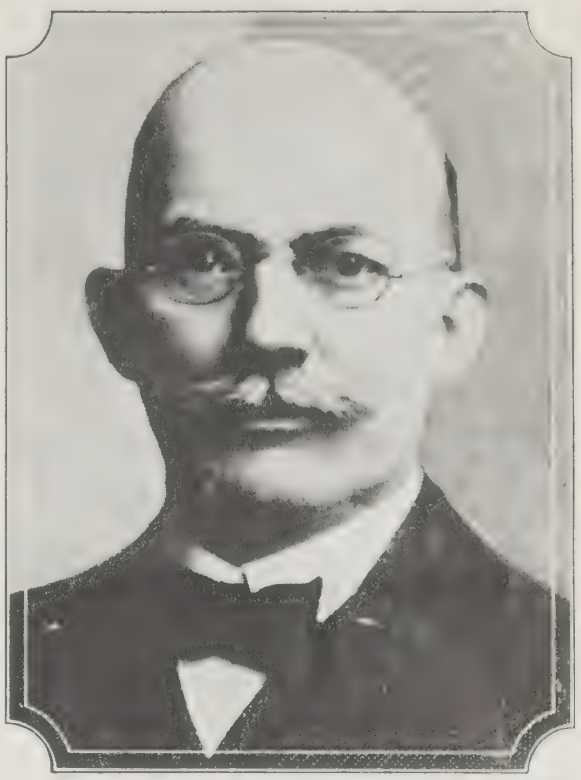
In industry the chapter is almost as bad. During the last three and one-half years (since Republicans have been conducting the government) there have been 1,669 bank failures, involving liabilities of $600,000,000, against 189 bank failures, involving $72,000,000 of liabilities, during the last three years of the Wilson Administration. During the first six months of this year there were 428 bank failures, or more than twice as many as in the last three years of the last Democratic administration.

Following the election of 1920, when it became known that a Republican administration was coming, and during the early part of that administration, after its policies began to become operative, 4,500,000 workmen walked the streets, having been thrown out of employment by a general industrial panic. When Woodrow Wilson became President in 1913, the estimated wealth of the United States was $185,000,000,000. When he retired in 1921 it was $300,000,000,000, but today it is down to $225,000,000,000. In other words, it has decreased $75,000,000,000 under Republican administration.

While thus permitting disaster to both agriculture and industry, the Republican administration has shown hostility to progress and reform in the general social condition of the people, and particularly to the improvement of conditions affecting women and children. Under the Wilson Administration marked progress was made in welfare legislation, but a sudden stop was put to it under the Harding-Coolidge régime.

The Republican party during the last three and one-half years has shown itself entirely out of sympathy with these reforms, notably by cutting to the bone the appropriations for the women's and children's bureaus of the Department of Labor, created under Democratic control. Opposition to the Child Labor Amendment has also been manifested, and it was only by Democratic leadership and votes that the amendment resolution was passed through Congress, and put up to the states for ratification.

The record of the Republican party in these three particulars is in striking contrast to the Democratic record of actual performance during eight distinctive years under Wilson. Then progress, advancement and constructive reform were the watchwords and the daily events. Honest industry was stimulated and freed from artificial shackles by the Democratic tariff laws, by the Democratic foreign policies, by the great Federal Reserve Act (the most constructive single piece of legislation ever put on the statute books). The Farm Loan Act, establishing farmers' banks, and other Democratic measures for the advancement of agricultural interests, made the farmers more prosperous than they had ever been before, or have been since.



(C) P. & A. Photos.

CHARLES W. BRYAN.

Now another great Democratic leader is offered in John W. Davis, of West Virginia. Beginning life as an obscure boy, from a wholesome American family, in a small town, he has risen by progressive stages, through his own efforts and genius, to a position which puts him among the four or five ablest men of his time. In each circumstance in which he has ever been placed, John W. Davis has more than measured up to its requirements. This was observed when he first hung out his shingle as a young lawyer in Clarksburg. It marked his service in the West Virginia legislature at the age of twenty-six. It explains the fact that he was elected president of the bar association of his state at the age of thirty-three.

Ten years later, when he was sent to Congress from a Republican district, he immediately commanded the attention and respect of his colleagues, and very shortly of the country. In one term he demonstrated such ability as a member of the judiciary committee and upon the floor of the House, that President Wilson selected him

(Concluded on page 14)

a Militant Program

Measures of Reform

NELSON

WHEELER CAMPAIGN

meet interest charges on borrowed capital." During that period the value of the farmers' investment, according to the same official figures, showed a loss of $20,000,000,000.

The grain rate decision of the Interstate Commerce Commission demonstrates, therefore, that there is no hope of relief for agriculture until the Esch-Cummins Law has been repealed and new rate-making legislation enacted in its place. Senator La Follette proposes as a substitute that railroad rates should be fixed on the basis of the amount actually and prudently invested in the railroads and on the actual cost of service.

This means that while the railroad owners will receive a fair return for every dollar that they have actually and honestly invested in the railroads there will not be one cent of profit paid on watered stock. It means that railroad expenses as a basis for rate-making will be limited to the actual amounts expended for service and will not include the millions of dollars now paid in profits to "insiders" and for such illegitimate expenses as propaganda and the employment of lobbyists. It means that both the railroads and the shippers will get absolute justice and nothing else. There is nothing new nor radical in this proposal. It is the basis that was used for fixing rates in the State of Wisconsin and many other states until the Esch-Cummins Law took out of the hands of the state commissions the power to fix interstate rates. It is the basis of rate-making advocated by every honest and disinterested student of the subject.

That is the immediate constructive proposal brought forward by Senator La Follette as a scientific method of fixing freight rates. His long experience in connection with attempts at railroad regulation convinces him, however, that even this thoroughgoing legislation will not completely cure the manifold evils now existing in the transportation situation. He believes that immense economies could be secured if the railroads were operated for service rather than for profit. He is ready, therefore, if necessary, to undertake government ownership and operation of the railroads, either as a whole or in part, under such safeguards as will prevent the evils of bureaucratic control. Like every other intelligent American citizen, he sees that the process of consolidation now taking place in the railroad world, as exemplified, for example, in the recent $1,500,000,000 Nickel Plate consolidation, means the creation of an absolute railroad monopoly. He believes that "a private monopoly is indefensible," and holds that if there is to be a monopoly of transportation, it should be under complete public control.

(C) U. & U.

BURTON K. WHEELER.

I have dwelt upon the transportation issue not only because of its extraordinary interest and importance, but because it more clearly indicates the thoroughly practical and constructive attitude with which the Progressive candidates approach the great economic and social problems with which they must deal. They have an equally definite program of public service in connection with the nation's natural resources. They propose that these resources shall be developed for the benefit of all the people, and advocate a national super-power system that will furnish electric light and power to the people and nitrates to the farmers at actual cost.

This is being done today in the Province of Ontario, and as a result the people there, including even the most remote farmers, are being supplied with electric light and power in unlimited quantities at prices less than half those charged by private companies on the American side for light and power derived from exactly the same water power.

The Progressive candidates propose to reduce Federal taxes by the only method that will produce results. Official figures show that 85 per cent of Federal taxes are now being expended to pay the cost of past and future wars—to pay the interest on the national debt and maintain the army and navy. The other 15 per cent is spent for the civil government. The tax-reduction proposals of President Coolidge and Mr. Davis are directed entirely at the 15 per cent of civil expenditures, which have already been cut almost to the bone.

La Follette and Wheeler propose to cut deeply into the 85 per cent, and thus substantially reduce the tax burden upon the entire people. They also propose to press vigorously for payment of the $11,000,000,000 which is now owned by various foreign governments, who are spending hundreds of millions of dollars for the support of huge armies and navies, but are unable to find any money with which to pay their honest debts.

The Progressive program for the relief of agriculture is too comprehensive to be covered in detail in any brief article. It goes to the very root of the evils which have destroyed agricultural prosperity in the United States. It proposes a complete reconstruction of the Federal Reserve System and the Federal Farm Loan System, so as to make the credit of the nation available

(Concluded on page 14)

Tobacco as a Destroyer of City Property

Estimated That Fire Loss Is Increased $40,000,000 by Users of the Weed

By IRVING FISHER
Professor of Political Economy, Yale University
Copyright, 1924, by Irving Fisher.

In the two preceding articles, Professor Fisher showed that tobacco is a narcotic poison, injurious to body and mind alike, impairing efficiency of muscle power and co-ordination, as well as of mental clearness and accuracy.

WE HAVE seen that tobacco is, in the last analysis, a source of bodily and mental distress rather than of genuine pleasure. Its devotees are, like the devotees of patent medicines, misled by appearances. They are mistaken when they think they have some net benefit to show for their money.

The money costs are only the first and least of the costs. Yet even the money costs are worth noting. There are vast amounts of capital invested, a great number of acres of land under cultivation, wage-earners employed, and sums of money spent on advertising as well as the enormous money cost to the consumers.

Actual Money Spent

The annual tobacco bill of American consumers is $1,600,000,000, according to an estimate made in 1921 by Professor Henry W. Farnam, my colleague at Yale University. This sum is spent on the tobacco only; it does not include the millions of dollars spent on pipes, holders, ash trays, cuspidors and similar commodities. This annual tobacco bill represents a burden of $16 a year on every man, woman and child in America, or about $80 a family.

Difficult to Shake Off

IN ESTIMATING our social burden, account must be taken not only of its magnitude in a single year, but also of its persistence. "One peculiarity of the tobacco habit," Professor Farnam points out, "is that, while it is often difficult to acquire, it is still more difficult to shake off. Indeed, in most cases, the will is as much bound as if the smoker had signed, sealed and delivered a mortgage on his own property. This is well understood by tobacco interests, which are giving away cigarets to the people of China in the confidence that, once the drug habit has been acquired, the interests can collect an annual tribute almost as surely as if they had conquered the country in war."

Because of this persistency of tobacco consumption, Professor Farnam shows that it is not unfair to capitalize the annual expenditure on tobacco, and to say that our country carries a direct interest charge of $1,600,000,000 on a social mortgage, of which some 20 per cent is in favor of the Treasury.

This direct charge represents the interest at 5 per cent on $32,000,000,000, the equivalent of the German Reparation Bill, or more than ten times the interest-bearing public debt of the United States in 1914, and one and one-half times our public debt at the end of 1922.

Capital, Land, Labor

The amount of capital used in tobacco manufacturing establishments in 1914, according to a government bulletin, was $303,840,000. "The capital that is put into liquor or tobacco cannot at the same time be invested in mining or railroading or agriculture or industry," Professor Farnam points out. "Tobacco directly interferes with investments in general, partly by the large number of fires which it causes and partly by the effect of excessive smoking (particularly in the form of cigarets) on the efficiency of the smoker."

The land utilized in the cultivation of tobacco in 1923 was estimated by the government to be 1,762,000 acres. About one-third of the total acreage was in Kentucky, and about one-third in North Carolina. A letter from the United States Department of Agriculture in July, 1923, stated that the acreage which is devoted to tobacco in those states would have produced at least average yields of corn.

Destructive Fires

HAD potatoes been planted on our tobacco land, we could have raised more than 133,000,000 bushels, or about a bushel and a quarter a head, according to an estimate by Professor Farnam. Not all of the tobacco land is adapted to potatoes. Some might be better fitted for beans, some for fresh vegetables, some in the South for peanuts, some for corn, wheat, rye, or forage. But, in any case, the possible addition to the food supply or other agricultural product would be great. If this tobacco acreage is a serious problem in America, what must be said of its magnitude as an economic factor in European countries, where food is at a premium?

Loss Through Fire

A large addition to tobacco cost is made by property loss through fires caused by smokers. A fire which originated in a field of dry brush burned fifty city blocks in Berkeley, California, in September, 1923. The property loss was estimated at $10,000,000, and 2,400 citizens were made homeless.

One city dwelling in the United States is destroyed by fire every four minutes, according to the Institute of Public Service, and farm buildings are destroyed at the rate of one every seven minutes. One hospital, five churches and five schoolhouses burn down every day.

Fire Commissioner Johnson of New York City estimated that 15 or 20 per cent of city fires may be attributed to smoking. Professor Farnam makes other estimates that corroborate these figures. Consequently, to the smoker must be charged his portion of fires, of the expense of fire prevention, of fire departments, and of fire insurance. For the five years ending in 1922, forest fires occurring in America caused by smokers numbered 5,694.

The loss in the United States from fire was estimated to be more than $400,000,000 for the year 1921. If we say that only 10 per cent of it (and not 15 or 20 per cent, as Johnson estimates) should be charged to smokers, we find ourselves with an item of $40,000,000 to add to the annual tobacco bill.

This is merely the property loss by fire. A terrible loss of life must be added. In the Triangle Shirtwaist Company fire, in New York City, in 1910, the lives of 145 persons were sacrificed to a cigaret. Such holocausts occur again and again, in addition to the constant life drainage from smaller fires all over the country. According to the Institute of Public Service, every day 41 persons lose their lives and 47 are injured by fire.

A great loss of time is also caused by such fires, as, for instance, in the fire which consumed the Equitable Building and which was caused by "the careless tossing of a match into a waste paper basket . . . . This match had doubtless been used to light a cigar or cigaret." Inconvenience and delay were suffered not only by workers in the company, but by stockholders and policyholders, and by other persons who had business relations with them.

To such losses of working time we must add the loss of valuable documents. In the Equitable fire, the documents lost were said to have been priceless. It is believed that the fire which caused the destruction of the state capitol at Albany, and the loss of a vast number of books and documents, was caused by a smoker. It was because of a fire due to smoking by which were lost important census records in the basement of the Department of Commerce Building at Washington that Senator Smoot introduced a bill to prevent smoking in government buildings.

What a Cigaret Did

AS AN example of the carelessness of smokers, I quote from Professor Farnam as follows: "Three days after the article on 'Wasteful Investments' was published (a comparison of the annual tobacco bill with the bills for other commodities, such as metals), windows all over Manhattan were rattled by a series of explosions resulting from the burning of a five-story warehouse . . . . The explosion deluged with burning brands the Erie Railroad yards and the machine shops that adjoined them, and started fires that destroyed two of the Erie shops, damaging or destroying twenty locomotives and a large number of freight cars loaded with merchandise. Burning fragments were blown across the Hudson River, and started small fires on the waterfront on the New York side. Over an area of one-half a mile in diameter, the streets were filled with broken window glass. A second explosion rattled windows again and swept vast columns of smoke over Lower Manhattan and New York Harbor. Several smaller explosions followed." The cause of the explosion was an employe throwing away the remains of a lighted cigaret onto a plank that was covered with dust from chlorate of potash. The dust burned like loose black powder grains. The *Evening Post*, in commenting editorially upon this event, said: "As for the reckless employe, it may as well be recognized that there is a considerable number of men who will not pay attention to rules against smoking, even in powder factories, unless they are compelled to do so. Is there any reason why we should go on allowing ourselves to be possible victims of their criminal obstinacy?" Thousands of smokers all over the country are similarly careless, even though their lighted cigarets do not happen to fall on such inflammable material.

Increase in Tobacco Consumption

An enormous increase is taking place in tobacco consumption. Between 1904 and 1921, the number of cigarets consumed increased from 3,000,000,000 to 52,000,000,000. Evidence of the great impetus given to smoking by the war is revealed in the fact that the consumption of cigarets in 1914, when the war started, was 16,000,000,000, while in 1918, when the war ended, the consumption was 46,000,000,000. The craze for tobacco became so great that the War Department in 1918 commenced issuing tobacco as a part of the ration for the American Expeditionary Forces. The situation has led many persons interested in the public health to give the matter more earnest attention than ever before.

According to the present rate of increase, which is seven-tenths of a pound of tobacco per capita in ten years, or a one-eighth increase, in the next ten years the *increase alone* will amount to $200,000,000, or $20,000,000 a year.

Possible Reduction

The per capita consumption of tobacco in the United States in 1920 was 6.3 pounds. The per capita consumption in Great Britain was only 3.17 pounds. If we Americans made no attempt to swear off smoking, but only reduced our per capita consumption to that of England's, we would cut down our tobacco bill one-half, or, in other words, save $300,000,000 a year.

Adding together what we might save if we adopted the English quota, and what we might save by stopping the increase, we would have $820,000,000 a year.

Comparative Costs

The annual tobacco bill is about one-eleventh of the aggregate cost of the first year of the World War to all the nations involved. But the tobacco bill is yearly increasing, so that, in the next ten years, with the present rate of tobacco consumption and the present rate of increase, our own nation alone will spend for tobacco as much as all the nations combined spent in a year of that costly and deadly conflict.

Some Comparisons

AS SAMPLES of how our annual tobacco expenditure of $1,600,000,000 compares with other items, I present the following from computations made by Professor Farnam:

Value of all metals mined in the United States in 1920	$1,724,000,000
Bituminous coal mined in 1920	1,950,000,000
Cost of building operations in 51 large cities of the United States in 1920	1,115,000,000
Common schools in 1918	763,000,000
Expenditures on highways in 1919	389,000,000

A shortage of homes in the United States has been one of the deplorable results of the war. Allowing $3,000 for each home, our annual expenditure on tobacco at its 1921 figure, without reckoning any yearly increase, would build more than 500,000 homes every year.

The government estimate of the cost of the public elementary schools, including kindergarten, for the year 1919-20, was $756,390,383, or less than half of the tobacco expenditure. The estimated expenditure for public high schools for the same year was $278,179,100, or less than one-fifth of the tobacco bill.

An average community can practically rid itself of malaria at a per capita cost of from 45 cents to $1 a year, under normal conditions, is the report made by the Rockefeller Foundation. This cost is less than one-sixteenth the amount per capita spent yearly on tobacco.

The United States Veterans Bureau at Washington, D. C., states that an appropriation of $428,160,773 was made for soldier relief work for the fiscal year of 1924. How small is this amount spent for the reclamation of the health of soldiers when it is compared with what we send up in smoke.

The total amount of money available for appropriation and expenditure by the American Red Cross from July 1, 1921, to June 30, 1922, was only $38,414,155, or one-fortieth of our tobacco expenditure.

Also, this annual tobacco bill is six times the annual expenditure for religion in all creeds—Catholic, Protestant, Jewish—reckoned by the figures for the year 1916, which are the last ones available.

Gives Nothing Back

WITH the saving of $800,000,000 which we would make if we adopted the English tobacco quota, we could duplicate nearly all of the new buildings that were constructed in our 51 leading cities during the year 1916, or replace two-thirds of the cost of those built in 1920; or we could add 50 per cent to our metal output (as of 1920), or more than treble our total output of anthracite coal (as of 1919); we could add 100 per cent to the expenditure on common schools (as of 1918) or treble our expenditures on good roads (as of 1919).

Is Tobacco a Profitable Investment?

The extent of needless waste is a significant factor in measuring a nation's wealth. Economic considerations must take into account not only the amount of accumulated wealth, but what that amount might be with proper effort and saving, and the extent of public benefits and social progress that might accrue therefrom. In examining our tobacco expenditures, direct and indirect, we find that not only do they represent a very great burden upon our financial resources, but they constitute an enormous diversion of money, land and labor which, if it were not used for tobacco, might be converted to other uses, to real and lasting economic advantage, and to the increase of social institutions that promote welfare and progress.

Conclusion

We have seen that tobacco costs the world in money billions of dollars to produce, advertise and market and millions of dollars from fire; that it also costs human life, health, efficiency and morals; while, on the other side of the ledger, we find only the money revenues of a few and the "pleasure" of the tobacco smokers, chewers and snuff takers, short-lived, elusive and self-defeating like the pleasures of other drug addiction.

In short, tobacco, like patent medicines and gold bricks, takes away our money but gives us in return little or nothing except illusion and distress as well as the curtailment of our power to enjoy life and health and to do our best work in the world.

Mr. Ford's Page

LOVE of country is the common attribute of the human race. But sometimes uncertainty arises as to what can truly be called one's country. Perhaps an answer may be found in the lines of Scott: "This is my own, my native land," for it is the land of one's birth which generally evokes all those feelings of affection and reverence that a man whose "soul" is not "dead" invariably feels.

The earliest recollections of youth are generally the most treasured, and not infrequently the most vivid. The memories of childhood become vivid as the years roll on, and through the haze of distance, in the mellow twilight of life, seasons of hardship and discontent are forgotten and scenes that are brightest retain their charm until the end. It may be the old farmhouse, the village, the busy town, the bustling city; it may only be a lonely dwelling on the mountain side, but its memories linger and are transformed by the magic touch of time.

As the years advance the vision expands, new scenes are opened up and new friendships formed. The village child whose outlook has been limited by a row of trees or a high board fence gradually sees farther and farther into the landscape. The desire to learn what lies beyond the line where field and sky meet, or to catch a glimpse of that unexplored world on the other side of the hill has to some extent been gratified, and there rises a desire to see still farther into things.

There comes a longing to explore, to go to some distant city to verify dreams or to develop plans long since formed. But the city is only the unit of a state, and the state a unit of a nation. By a natural transition a world-wide outlook must be reached, for this is the only logical outlook after all. A man may cherish the fondest memories of his home town, but he must shake off his parochialism when seeking for a broader vision.

Are the American people growing too parochial? Is their general outlook being narrowed to such an extent that they fail to see the broad fields which lie on the far side of the hill? Are their ideas being "cribbed, cabined and confined" by absorption in those things which lie nearest to hand, to the exclusion of everything else? Sometimes it is good to be self-centered, the faculty of concentration is a valuable one, but concentration is a powerful instrument which must not be misused.

It is a fine thing to know all about one's native land, but it is likewise desirable to know something about other lands or our horizon becomes contracted. Many people have little worlds of their own and desire to know no others. This may arise from a feeling of contentment, of satisfaction with things as they are. This feeling is quite laudable as long as there is no danger of its degenerating into narrowness of vision and a myopic outlook.

Let us not depreciate the corner grocery; many gems of wit and wisdom have been evolved in its precincts, many knotty problems have been solved within its shade; but a very wide world lies beyond its sphere and it is into this unexplored field that the eyes of those alert to the possibilities of life are directed. The cramped spirit which is sometimes unconsciously fostered in small communities may prove a handicap to progress if not overcome.

Americans pride themselves on taking a nation-wide view of things. This is very commendable as far as it goes. But it should be remembered that while we are proud of being citizens of the greatest republic on earth, we are also citizens of the world. The general welfare of the world is as much our concern as it is that of any other nation. We cannot practice the detachment of the inhabitants of Mars—if there are any. Geographical distinctions are but flimsy barriers that modern enlightenment is breaking down.

As a step toward broadening the vision of the nation the proposal to have an annual observance of Columbus Day on the twelfth of October seems most timely. The movement has been warmly endorsed by the President who expresses the opinion that it is "particularly timely now, when everything possible and reasonable should be done to develop that international accord which is fastened by common historical, cultural and sentimental ties, and strengthened by common political, economic and commercial interests."

Norsemen may have landed on the American continent as far back as the year 1000, but they did not become colonists until hundreds of years afterward. The coming of Christopher Columbus was the beginning of an era of colonization and expansion which still goes on. The Spaniards, the French, and the British, all came in their turn and founded colonies along the coast which were gradually pushed farther and farther into the interior. The Latin races predominated for a time, and then came the Anglo-Saxon and the Anglo-Celt who speedily made their influence felt in every direction.

Ever since the advent of the Genoese navigator America has received the overflow of humanity from the Old World in ever-increasing volume. Europe without America as a vast field of settlement for its surplus population would have become an Armageddon of ceaseless racial strife. It would have been like the crater of a titanic volcano continually boiling and bubbling and always ready to fling forth the seething lava of desolation and despair.

If a gigantic fleet could be chartered to convey the whole of the inhabitants of this continent back to the countries of their forefathers some idea would be obtained of what such a myriad mass of humanity crowded into one hemisphere would mean. Providence seems to have held one-half of the world in reserve so that it might be taken possession of and developed when the other half gave signs of becoming too small to contain its teeming millions.

It would be difficult to estimate the number of races that are at present included under the general term of "American citizens," but it is safe to say that it comprises representatives from all the European peoples, the most of the peoples of Asia, and a fair proportion of the dusky tribes of Africa, as well as representatives from groups of islands scattered over the seven seas. It is a mixture of the peoples of the earth that at present constitutes the great American nation. To the Latin races this country is indebted for its early pioneer work, and to the immigrants from the north for that steadying influence so essential in the direction of its destinies.

It is, therefore, becoming that there should be set apart a day devoted to the fostering of that spirit of cohesive nationality upon which depends the strength and well-being of the land. But it requires the cosmopolitan mind to visualize the people of America welded together for the common good. Breadth of vision such as Columbus possessed is what we require that we may see beyond the narrow limits of a township, county, or state. If Columbus had been parochial minded he would never have risen above the rank of a Mediterranean coasting skipper.

It is just as necessary for the nations of the earth that are gathered together on this continent to have common ideals as it is for the nations of Europe to live in peace and concord. Mutual understanding makes for peace and peace is an essential of prosperity. Disunion is disintegration, and disintegration means the waste of energy and effort and the defeat of every scheme which aims at the amelioration of the lot of mankind. Every man's aim ought to be the good of the whole and not the aggrandizement of any particular section. A broad and generous spirit of service and unselfishness must prevail if true progress is to be maintained.

BREADTH of vision is necessary if progress is to be made either by individuals or countries. It was this quality that enabled Columbus to discover America; and it was the same attribute that made it possible for the country to be opened to the millions that came after him. There are other worlds than those that lie within the town line or the state boundary; there are other fields to be surveyed than those that are circumscribed by the sky line. A broad outlook and acquaintance with things that lie beyond one's immediate environment eliminate prejudice and develop understanding. Peace, prosperity and concord in the nation, as well as in the world at large, always appear more distant when the view is narrowed. Success in any enterprise is never attainable when we look through the wrong end of the telescope.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

President Not the People's Choice

EXCHANGES all over the country are discussing the possibility of the presidency failing to be settled in the Electoral College, fear being generally expressed that "the people's choice" may lose out in the political struggle.

The point is not at issue, no matter what the result. The President literally is never chosen by the people. Originally the electors were chosen without any definite candidacy in view, and named their personal choice. Even now, an elector is free to exercise his individual preference without regard to the convention nominees. He represents the state, not the voters, and it is possible, indeed, it has occurred, that the Electoral College majority may represent a popular minority.

As an example, one has but to consider the popular vote for McKinley and Bryan, in 1896. That "great victory" would have been reversed had there been a change involving less than fifty thousand votes, properly distributed. Such a result was not indicated, to be sure, in the electoral vote, but as that is controlled by state victories, whether giving large or small majorities, it is obvious that a President may be elected legally without a popular majority.

Nor is there cause for alarm if the electors fail to make a choice. They vote but once. Suppose a candidate dies between the November election and the meeting of the electors in their respective states. There might be a split in the vote on that ticket. This was the case with those elected in the Greeley campaign. If the declared candidate were of the winning side, it might happen late enough to prevent conferences, and the same action would also throw the election in the House. Here, continuous balloting, by states, may keep up without result until the expiration of the Congress, but it is not likely to happen. The House is limited in its choice to candidates voted for in November. If it fails to elect, the Senate chooses from among the vice-presidential candidates its presiding officer, who thus by virtue of the office is elevated to the presidency, as was President Coolidge.

Only in case the House majority—by states—is opposed politically to the political party winning the election for President, or, more frequently the case, the personnel of the Senate is opposed, is there danger of a reversal of the November result. In either case, the result is perfectly legal, and there is no danger of harm resulting.

MacDonald's Fall

IN THE collapse of the British Labor Government the inevitable has happened. But the sudden crash of the Ramsay MacDonald regime has not come about in the manner that was generally expected. It was thought by those in close touch with British politics that the Premier's pact with Soviet Russia would cause his downfall as soon as it had to run the gauntlet of the House of Commons, but, as is sometimes the case, the event is the result of a minor issue, but one in which an important principle was involved.

James Campbell, the editor of a Communist weekly, was accused of sedition inasmuch as he published articles inciting soldiers to mutiny. The government suddenly withdrew the prosecution against him, and the opposition, consisting of the Conservatives and united Liberals, alleged that this had been done through pressure from the Communist element in the Labor party. An inquiry into the withdrawal of the proceedings was demanded, and on this being flatly refused by the Premier a combined vote of censure from the Liberals and Conservatives was carried by 364 to 198.

Since the accession to power of the Labor party last January, Ramsay MacDonald has had rather a stormy voyage. The election promises that were made about finding a panacea for Britain's houseless and jobless millions was the tidal wave on which the Laborists floated into power, while the same wave submerged the Protectionist policy of the Baldwin's Conservative administration. At this date that panacea seems as remote as ever; but neither this nor the Russian agreement might have been sufficient to wreck the administration so soon if the Campbell affair had not supervened.

MacDonald has had a difficult course to steer, and a somewhat unruly crew to manage. While the Tories and some of the Liberals have been denouncing him as a Red Socialist, the extreme left of the Labor party has attacked him for not being Red enough. It is between those two jagged rocks that his ship has gone down.

A dissolution has been granted as a preliminary to an early appeal to the country, and the indications are that the electoral pendulum will swing back to where it stood before Labor had its big chance

The Mark of Cain

THE high homicide rate in the United States is causing considerable worry to the life insurance organizations. One prominent company has made an investigation of the matter from its own records and found that last year it paid $724,000 in homicide claims. "Information of more or less satisfactory character could be gathered for only 146 of 446 homicide cases among the policyholders during the last months of 1922."

Out of this number only 58 went to trial, and a verdict of "not guilty" was returned in 16 of these. Out of the 41 judged to be guilty only 1 has been executed. Of the 146 homicides investigated 114 were manslaughter or murder cases.

The callousness with which human life is being taken in this country, and the indifference with which this matter is being regarded by the people is a subject for grave concern. The homicide rate in the United States is estimated to be 17 times as high as that in England and Wales, and the reason for the difference is attributed to the more rigid and impartial enforcement of the law in Britain.

When influence of any kind is brought to bear for the defeat of justice it ought to be scourged into the wilderness as an evil thing. There are other laws of this country which are being torn to shreds, but there is no more clamant need than that which calls for the putting into practice all legislation which has been framed for the safeguarding of human life from the assaults of the depraved, the degenerate, and others destitute of those attributes which distinguish humanity from the brute creation. The mark of Cain has become a too familiar sign on the brows of the present generation.

The Cradle of Man

MR. ROY CHAPMAN ANDREWS, leader of the expedition which accomplished such splendid work in archeological research in the heart of Mongolia, is again in China at the head of another expedition which is fully equipped for the task of unearthing more treasures in a part of the world which has been described as "a veritable paleontological Garden of Eden."

The dinosaur eggs and the innumerable fossils that Mr. Andrews and his colleagues discovered in this part of the globe were a revelation to those groping for the truth regarding the long-distant past, and it may be anticipated that further important discoveries are impending.

The American Museum of Natural History is doing fine work in encouraging and assisting the work of these scientists, and the world will await with interest their further progress in the field in which they have gained such distinction.

Last year the work of the expedition was confined to the older rocks, where the dinosaur eggs were found, but now attention will be given to later geological formations in which Mr Andrews hopes to be able to test the theory that the Central Asia plateau is the birthplace of man.

The Bible in the Public School

A MOVEMENT looking to the compulsory reading of the Bible in the public schools is gathering momentum and bids fair to be a political issue if the opposition, emboldened in late years in the spread of a sort of agnosticism, shall choose deliberately to fight it.

The strength of the opposition seems to lie in the idea that reading the Bible is but a step toward an ultimate introduction of religious teaching, where eventually denominationalism may control. That is another matter. Religious training, beyond the instillation of those truths common to all religions, which go to build up character, is not a function of the public school. Indeed, the effort to proselytize is not religious training at all.

So far as any danger in that respect is to be feared, it must have developed in the early history of public education, if at all, when the reading of a chapter from the New Testament, and prayer, formed a part of the daily opening service in all schools. That it did not is proved by the experience of those reared under such a system.

Men who declare Bible reading and prayer should have no part in school exercises offer no objection that the invocation is a preliminary of every daily session of both Houses of Congress, of all legislative bodies, and even of political conventions. Yet every argument applicable to the public school is equally applicable to such gatherings.

No boy or girl ever was injured, half a century ago, by attendance at "chapel exercises," which preceded recitations. The first half hour of school was devoted to them.

Who can say there was anything out of the way or harmful in this order of procedure? There was none. Quite the reverse. There was discipline, a daily contact between those in and those under authority, and the inculcation of a respect for all religion.

Where the Bible boosters are in the wrong is in insisting that such practice be made compulsory. It was not then; for parents had but to indicate their desire, and their children were excused from attendance at "chapel exercises." Few went to this extreme, for no sectarian influence was seen.

There should be no legal regulation in the matter. The authorities of each school may well be left free to adopt the plan if the people desire, while opponents of the plan can have their way if in sufficient numbers to rule.

The Constitution

OFFICERS and directors of banks are compelled to know the texts of the banking acts. Business men are always seeking information about credit and contract laws; workmen's compensation and income tax acts. Professional men do not fail to inform themselves of the laws dealing with their affairs.

Golf players pride themselves upon knowing the St. Andrews' rules which govern the royal and ancient game.

Therefore, it is surprising to note that these same people and many others are usually ignorant of the text of the Constitution of the United States. While most of them are opposed to suggested changes in the Constitution they are unable intelligently to discuss the thing they seek to defend.

Conservatism is a prudent trait. Indeed, the conservative is at this juncture a saving grace in our national life. However, conservatism that is ignorant of the basic law which it instinctively defends is discreditable to both the individuals and the country.

Americans need more facts, especially in dealing with citizenship problems. No person who has prospered and who professes a desire to see the nation well governed has any excuse for failing to familiarize himself with the Constitution.

Government Supplies

SEVERAL branches of the Federal Government show a tendency to free themselves from dependence upon the private contractor for staple supplies.

The Government Printing Office, the largest printing plant in the world, by the way, makes its own inks. The quality is controlled thereby and the saving is tremendous. Last year 191,695 pounds of 55 varieties of ink were made for $25,537.

The government printing office also makes all of the jelly-like composition inking rollers for its 167 presses. The Bureau of Engraving and Printing, the paper money and postage stamp factory designs and builds the intricate automatic and semi-automatic machinery employed there.

The Post Office Department makes its mail sacks and locks in its own shops at prices much below those of commercial contractors.

Visiting an Earthly Paradise; Damascus, Gem of the Orient

Though Not Now Famous for Its Steel Blades, It Still Retains "The Street Called Straight"

By HAL WALKER

In this part of the wonder voyage the writer gives a vivid impression of Damascus and other places in the Near East.

DAMASCUS is one of the four terrestrial paradises, according to the Arabs, and as we dropped into its coolness and heard the trickle of running water after hours on the desert of rocks, following other hours of crossing the desolate chain of the Anti Libanus Mountains, it took no great stretch of the imagination to see why it should be a paradise to the ancients who traversed the route we had come for days with slow-plodding camel caravans. Our travel had been made at the twentieth-century pace of hustle by motors where the only speed limit was the condition of the route, while the camels take ten days or more to cover the ground which we did in fifteen hours.

All along this great camel highway we saw no other transportation except the lumbering camels, caravan after caravan, each led by its driver seated on a diminutive burro, the latter scarcely as high as the camel's knees. At various spots along the route where there were small springs two or three caravans rested, the camels kneeling and chewing their cuds with much grumbling, while the human elements of the caravan mixed barley flour with water into a thick paste to be rolled out thin and cooked in an earthenware oven over fires of dried camels' excrement.

For hours the centuries had rolled back that afternoon and then, as the sun touched the horizon, we began to descend over a perfect road and the scorching heat gave way to a coolness almost chilly as we struck the first green trees we had seen since noon and heard running water. The road wound between high walls behind which lights in homes were beginning to show as we sped down the ravine, and then, all at once, our way opened out and Damascus, with wide streets and clanging trolley cars, hotels and cafés, welcomed us.

Damascus is the capital of the state of the same name, formed by General Gouraud under the French Mandate, and the second in importance. The state of Great Lebanon with its capital at Beyrouth is the first, the state of Aleppo and the autonomous sanjak of Alexandretta form the third, the autonomous territory of the Alouites forms the fourth division, and the government of Djebel Druze the last. The country is governed lightly, native officials being elected, together with administrators; a delegate of the French High Commissioner acts as adviser with technical councilors in each state.

There are 3,000 000 inhabitants in Syria, more than half of whom are Mohammedans, the principal others being adherents to the Maronite faith, the Greek Catholic or Orthodox, the Armenians, and other sects among the Protestants, together with a number of Jews. All told there are twenty-nine races or religions in the territory occupied by the French Mandate. Twelve hundred common schools have been established by the French as well as several secondary schools, many hospitals, dispensaries and orphanages, a number in regions never before having these advantages, in spite of the work of American and other missions in the country.

It was in Damascus that we heard our first complaints of the French régime from the natives. The complaints at Beyrouth had come from French residents themselves, but here in Damascus it was the large landowners who had a grievance against the French. This was explained to me by a young Syrian, or Arab. He owned, I found out later, twenty-six villages, body and soul, and his complaint was that he could not get enough of the crop from his tenants. Under the régime of the Turks, he had received 90 per cent of the farmer's crop, the farmer getting 10 per cent for his labor, out of which he must provide seed for the next year's sowing. General Gouraud had cut this to 75 per cent for the landowner and increased the farmer's share to 25 per cent. This young man who talked with me was the graduate of an English university, a bey, owned several luxurious motor cars, and had an army of servants. He and his sort were dissatisfied, but needless to say the illiterate and toiling peasantry hail General Gouraud as next to a deity, if they don't even place him a bit higher.

Damascus, however, was not all politics, and the newspapermen in the party as well as some of the French members slid away from all the formal functions possible to roam through the souks and the mosques or through the narrow, crooked streets packed with humanity, donkeys and camels, with here and there a motor car. There are 250 mosques and Mohammedan schools in Damascus, the most famous mosque being

Homs, Mosque Si Khaled.

that of the Ommiads built in the eighth century, part of it on the walls of a Christian church. This mosque is one of the wonders of the world in Arabic literature, and in it is the reputed tomb of St. John the Baptist.

The souks are even more attractive than those of Constantinople. We never tired of wandering through them, hour after hour, with the scene changing every moment. It was necessary to dodge donkeys and camels bearing burdens and sometimes the gaily caparisoned camel of some rich native official who rode through the streets with no heed to anyone or anything. It was a case of get out of the way or be run over.

There were gaily dressed Bedouins from the desert making their purchases at the open stalls; the inevitable coffee seller wandering through the streets with his elaborate coffee receptacle slung across his chest and almost as huge as himself; the public writer with his stool and small table on the sidewalk writing letters for those who are unable to write for themselves, and their name is legion, while Syrian dandies stood in front of the fez-reblocking shops, waiting for their red headgear to be moulded into shape on huge brass blocks as we block a hat at home.

Homs, with the desert beyond.

Ancient ruins, Damascus.

In "The Street Called Straight" which is the main artery of the Damascus souks I ran across a fez-clad, brown-skinned individual wearing the button of the American Legion, the same as myself. Naturally I was astonished to find here in an Oriental bazaar, thousands of miles from home and where there was no American colony, a man who had fought with the United States Army or Navy. He told me he was from Dakota; had served for a year in the army (giving me the regiment and company), and had come back to Damascus where he intended to stay. He had opened a rug store in the bazaars and said he was doing very well. And Damascus is the place to buy rugs, without any question, but, of course, one wants to know something about them as the traders are keen to charge high prices.

Many Syrians have been educated in American schools and many others have been in the States. Another whom I met at the hotel had just returned from Michigan with his wife and three children. He said his children were Americans, he had a good business in the States but had sold out because he wanted to see Damascus, his parents, and above all he wanted his children to visit his native land.

"I had a good house and an automobile," he said. "My children had good schools and American playmates, while here they have nothing and are homesick, so I am going back soon."

While the famous Damascus blades are no longer to be found in this city, and while Damascus has lost some of the importance it had as a trading city before the opening of the Suez Canal, it does have a big trade and is noted now especially for its gold and silver embroidery, jewelry and products from farther east which reach it by the caravan route. Its fruits are famous, and the homes of the rich, behind their high walls, are a delight to the eye. There are several good hotels, the only drawback being that when a guest wants a hot bath he must give notice at least twelve hours in advance.

The French are doing much archeologic research under the direction of M. Eustache de Lorey who has founded a French museum.

But as all things, pleasant or unpleasant, must end sometime, so our visit to Damascus came to an end. Speeding past the diminutive street cars with their special compartments for veiled women, where no man may enter, we started our long caravan for the longest one-day trip of the journey, having lunched at 10 o'clock in the morning and not due for dinner until we reached Homs, eighty-six miles distant, over a tortuous desert road. In all too short time we passed through the encircling gardens of Damascus made possible by the waters of the River Barada, which loses itself in the earth twenty miles from the city, and were in the real desert, hot and dusty.

We had noticed rifles in all the automobiles when we left Damascus but thought nothing of it at the time. Within a few kilometers of the city, however, we came upon two mounted soldiers, motionless, a hundred yards from the roadway, and thereafter every kilometer or so during that long day there were those silent guardians, at first mounted on horses, but later, far from the towns, on camels, all a part of the native constabulary organized under the direction of General Gouraud for the protection of the highways and the scattered settlements against the roving Bedouins.

Then we understood the meaning of the rifles, but not until we reached a small native town, baking in the hot afternoon sun, did realization fully dawn. There, while officials brought us drinks of sirups and plain water, we learned that the Bedouins, two nights before, had raided the town and driven away 400 head of sheep, which are always brought into corrals from the ranges at night.

Then on we went through choking dust and later over a rocky waste, to come again to thick red dust which continued all the way to Homs, over a road which was never meant for speed, but these drivers, French and Arab, never seemed to realize that fact. Every forty kilometers we passed through an Arab village, silent, seemingly deserted, and baking in the torrid heat, and suddenly after miles of a rocky waste, we saw a huge

(Concluded on page 11)

Whalemen Who Still Sail On

Although New Bedford Whaling Is Dead

Old Salts Organize a Unique Social Club

By CLARENCE J. HALL

CAPTAIN
JAMES T. AVERY.

SAFELY launched and with every sail drawing alow and aloft and away on a voyage which should last as long as men love romance is the New Bedford Whalemen's Club. In the hold and between decks is stored a precious cargo of traditions of brave days, and at the wheel is a clear-eyed, weather-beaten old skipper. The sun of whaling sinks into a peaceful sea and there rises this phantom ship, to sail on and on and on over gold and purple waves of memory toward a limitless horizon.

It's "Greasy v'ge Cap'n!" from all New Bedford as the figurative lines are cast off, and the good ship begins to lift to the surge of the sea. Unique among the social organizations of the country, New Bedford may well cry to this club the time-hallowed farewell of those who waved goodby from the dock to the departing sailors. Too many epics of early American life have sunk in the sea of oblivion unheeded by a busy people. It is intended that the glory of the whalemen shall not be forgotten.

The New Bedford Whalemen's Club is more than merely social. Its prime purpose is to keep alive the whaling spirit and traditions. A rising tide of industrialism is not to wash away all memory of the fishery which carried the American flag to every port of the globe and lighted the lamps of the nation.

Actually more substantial than a phantom ship will be the home of the New Bedford Whalemen's Club, if everything as planned goes aright. The whalemen expect to have as their home the famous old bark *Charles W. Morgan,* almost as sound as when her timbers were laid in 1841, not far from the place she now lies so forlorn. This vessel, one of the oldest square-riggers in existence, will, according to the plans, be maintained as a perpetual memorial to the days when New Bedford men pursued leviathan, and to show the future generations just what a typical whaling ship was like, when a short time hence all other whale ships will have vanished from the seas.

The *Morgan* will be kept fully rigged and she will carry all her ancient equipment of gear, with boats, harpoons, lances, lines and all the paraphernalia of the industry which gave way before the discovery of petroleum and modern science. The tryouts amidships, where the oil was boiled from the slabs of whale blubber, will be kept intact. No more changes will be made in the fittings and deck equipment than necessary. Forecastle and the master's quarters aft will be unchanged except perhaps for the application of soap, water and paint, and the installation of electric-lighting fixtures, for even the whalemen could scarcely be expected to forego the convenience of a few modern improvements in favor of dim whale oil lamps and spermaceti candles.

Below, it is the intention to convert the vessel into a museum. Implements, relics, pictures and books pertaining to the whaling industry will be accumulated. She will, in short, be a cyclopedia of whaling for the hordes of visitors who flock to New Bedford each year. She will be a brave bark which sails the Seven Seas in memory.

The Whalemen's Club didn't spring full-grown at once as did Minerva from the brain of Jupiter, mature and in complete armor. In a store not far from where the waves slapped against the wharves the whaling skippers were wont to congregate on cold winter evenings around a red-hot stove in a corner where heavy sea boots and woolen socks filled the shelves. The store was the Samuel Horvitz Whaling Store, where for nearly three-quarters of a century those who went down to the sea had gone for outfitting supplies and a good "gam" (talk). Near where these grim old mariners tilted back their chairs and smoked their cigars and pipes was a quaint board, at which a glance to them told a significant story. On it was recorded the names of whaling ships, the date of departure, the place last reported, the scheduled return date and the actual return date of the vessel. Upon it in a few scratches of chalk were written tales of storms and tragedy. Thus, as recently as 1921, just before the passing of this nook, known all over the seas as "Portygee Corner," fourteen ships were listed and among these two entries:

"Bark Swift—Capt. Dunham—lost
Pedro—Capt. Lopes—lost"

Both these ships, the *Ellen Swift* and the *Pedro Varella,* sailed in 1919 and neither was heard from.

Commerce has crowded out "Portygee Corner." There came a night when the skippers munched red apples around the glowing stove for the last time. But, fortunately, shortly before that time the "Whaling Store Captain's Club," a semi-formal organization, had come about. Here is where Harry A. Neyland, an artist by profession and a whaleman deep down in his heart, comes in. He was present the night the Horvitz store passed to the things of memory.

Let us take a trip down County street, the broad way, its turning length lined with patrician homes, of which Herman Melville says in "Moby Dick," "All these brave houses came from the Atlantic, Pacific and Indian oceans. One and all they were harpooned and dragged up hither from the bottom of the sea."

At the rear of the Swain School of Design, of which Mr. Neyland is director, is his studio, a most interesting place. The very entryway is heaped with things which savor of whaling. There are ivory canes, carved by patient hands through long hours on four-year voyages, tall harpoons stacked in a corner, ship's lanterns. Once within the big room there are even more implements of whaling and there the grandeur of the dead New England industry has been told in paint.

The artist Neyland has caught the very spirit of adventure in those paintings of early days. Here is a huge canvas of a splendid ship, a cloud of canvas leaping on the foaming crest of a curling wave. Over there is wallowing desolately a battered derelict with stumps for masts and dead men for a crew. Here is a forest of masts, glistening under a warm sun, a sight which New Bedford sees no more, and there is a ship floating on through blinding snow.

All these multitudinous paintings are an accurate story of ships. The plaint that the artist knows nothing of what he is trying to make live on canvas can never be said of Harry Neyland. His whaleman's heart forbids. Telling of the men whose cry was, "A Dead Whale or a Stove Boat," no effort was too great. No waterfront wind was too sharp to hinder him from camping on the dock while his clever fingers laid on the pigments which preserved some noble ship now vanished. He went on tugs which escorted outgoing ships, and with sketchbook and canvas he followed them until they rode the high seas. With rule and T-square he poked over the vessels in dock as a marine architect might, and in mechanical drawings he put down the exact measurements. There is no guesswork in the whaling paintings of Neyland.

The Wanderer in tow.

One of the finest collections of ship models in the country has been accumulated in this studio, until there are now some thirty or forty. This beautiful little fleet which was never built to know the swell of the sea tells another mute story of days gone by and aid the artist in the painting of a ship now green at the bottom of the sea. They represent almost a modest fortune, some of the larger models being very valuable.

It was in this great room, while a ship's lamp burned dimly in the center, that the New Bedford Whalemen's Club was organized in 1921.

Because an unkind fate had prevented Neyland from shipping in his youth, this prime mover of the club was unable to sign up on club papers as an able-bodied seaman. Instead, he was put down as steerage boy. He much regrets the circumstances which prevented him from qualifying as a real whaleman but he is inordinately proud to be taken along on this voyage in any capacity. The officers chosen on the night to navigate the ship were signed up as follows:

Captain (president)—Captain James A. Tilton
First Mate—Captain John T. Edwards
Second Mate (treasurer)—Captain Andrew J. Cory
Third Mate—Captain John T. Coakley
Fourth Mate—Alexander J. C. Hart
Fifth Mate—Pemberton H. Nye
Steward—William P. Briggs.

The "ship's articles," drawn up in regular style for the government of the club make an interesting document. By its provisions, so long as any of the bona fide whalemen remain, its destiny will be in their hands. When these men are gone the landlubbers, who are whalemen at heart, may take control. The atmosphere of whaling days is well preserved in the by-laws. Here is a sample:

"Captain to receive a lay (share of the profits) not exceeding $5 for the yearly voyage.

"Able seamen to receive a lay not exceeding $1 for the yearly voyage.

"Green hands to receive a lay not exceeding one cent for the yearly voyage.

"The ship will not 'haulaback' for a 'gam' with the ladies unless it is so commanded by the captain.

"The captain shall be able to discharge at any point or port of entry, or to place in irons any member of the crew whose conduct may require such action. Of this the captain is to be the sole judge.

"A mutinous crew composed of a sufficient number of men and officers shall cause the captain to be placed in irons or shall have power to make him walk the plank."

At the start of these papers of incorporation it is clearly stated that the object of the club is "to advance the knowledge and love of the whaling industry and to preserve works, relics and books pertaining to this life. . . . ."

After reading the charter in the studio of the marine artist let us, just for the fun of it, take a stroll down the picturesque streets to where the tides twirl against the docks and then go over the Acushnet River to where the *Morgan* is idle against a wharf in Fairhaven. Here she is, blunt-nosed, broad of beam, listing slightly toward the dock. Sea gulls cry as we approach.

We clamber over the greasy, dingy bulwarks, and the reek of blubber and tar assails us. We thread our way over a confusion of rusty anchor chains and empty casks. A whale ship at its best after the first baptism of oil was never a thing of beauty nor of fragrance, and the countless voyages of this ancient wanderer have added nothing to its qualities. Everything is as if the last crew, after a protracted voyage, frantically leaped ashore eager for a glimpse of sweetheart or wife, and things were left just as they fell.

It is plain to be seen that there is nothing of the fair clipper about the *Morgan.* She and her sisters were not built for speed, but to withstand the fury of the Arctic gales and the bite of ice floes. Many yachts are larger than the *Morgan,* she measuring but 105 feet overall, and being of but 313 tons displacement. But when the storms came howling around Cape Horn and icebergs went swirling past, the brave old ship wallowed as safely along as could anything exposed to the awful fury of the sea.

Descending the narrow stairs to the forecastle, sometimes known as "the black hole of Calcutta," we first take precautions to affix an imaginary clothespin to our noses. This dungeon was the sleeping quarters of the crew for months on end, and even for several years. The glare from a provident candle shows tiers of berths, gloomy and grimy beyond description, and in their loneliness a bit ghostly. Great cockroaches scuttle at the echo of our footsteps, running helter-skelter to a haven of safety among scattered garments left by the last crew.

Pervading all is the smell of bilge water and the sweetish aroma of the whale oil, a penetrating smell which forever impregnates the timbers of a whaler. How on earth could twenty-seven men exist and carry on the usual functions of life in such a place? Imagine it when the *Morgan* was tossing in the stifling tropics, with perhaps hatches battened down against a gale.

Aft are the quarters of the "old man," and his of-

ficers, more roomy it is true; still not palatial. An incredibly narrow and crooked stair leads to the cabin, where under the dim glow of a skylight is the table with folding benches and on either end the cubbyholes where the officers slept. Over the very rudder is a haircloth sofa, built in, about the only thing suggesting real comfort, that and the skipper's bunk, which in his private cabin swings upon a pivot to the roll of the ship.

Imagine that it is a pleasant spring night with the evening star shining in the west and the lights of the New Bedford mills twinkling across the still waters of the harbor. Just over the high-poking bowsprit glares the red eye of the light on Butlers flat. Answering it are the intermittent glowing of strong old pipes and good cigars. The occasional scratch of a match illumines the rugged face of an ancient mariner. It is a meeting of the New Bedford Whalemen's Club, business over. It is just the sort of night when fancy goes roaming afar, to these men to the farthermost ends of the earth.

Captain James F. Avery, the present club skipper, is a small, wiry man, with snapping dark eyes. He is the man about whom his mates tell the following tale:

"Cap'n Johnathan Smith's wife was laid up for a spell, and bye and bye got so sick that she thought she was like to die. The Cap'n was out to sea and she wanted to see him right bad before she went Cap'n Avery went to see her and after a little talk he took the commission to bring her husband home. And mine you the only address she could give him was 'somewhere in the Atlantic Ocean.'

"He took a seagoing tug and with some sixth sense and with what he knew of the routes of whales and whalers and his seaman's logic located his man and had him home within six weeks. Mrs. Smith lived to a ripe old age and the Cap'n died long before she did."

Captain Avery was himself given up for lost when he pursued a whale in his small boat from six o'clock one morning until six o'clock the next before he sank his iron into the great creature. "What a blame fool I was in those days when I was young," he exclaimed. "I didn't deserve ever to be picked up again. When I left my ship she was becalmed. When my mate in the ship did pick us up there were tears in his eyes. He never thought he'd see us again."

Captain Avery is not a gentle-speaking man and his mates declare that despite his diminutive size the biggest man in the crew jumped when he spoke, or shortly thereafter found himself suffering with a headache and triced up by the thumbs.

Next to little Captain Avery as he sits on the deck of the *Morgan* is Captain "Ben" Cleveland, the "skipper-naturalist," who is equally at home bullying a crew of rough sailors or classifying botanical specimens and gathering birds' eggs. Neither big whales nor mineralogy have any terrors for him. He was the first to go after "sea elephants" for their oil. Twice he was employed by the American Museum of Natural History to assist in the studies of flora and fauna in the South Seas.

In 1909, Captain Cleveland was commissioned to take the brig *Daisy* to sail away to Desolation Island, where he made his sea elephant voyages, to collect scientific specimens. Desolation Island lies 2,500 miles south of the Cape of Good Hope in latitude 50 degrees and longitude 70 degrees. It is a misty, cold, volcanic island inhabited by bellowing sea elephants, arching penguins and crying sea gulls. The elephants are great lumbering creatures, sometimes more than twenty feet long and eighteen feet in circumference, and a big fellow will yield considerable valuable oil. The whalemen ashore on this island, resembling a nightmare, tap the females over the heads with clubs and shoot the more dangerous bulls.

Whaleship putting out behind a tug.

"This expedition to Desolation was one of hardship," begins Captain Cleveland. "After leaving Cape Town the weather constantly grew colder and for nearly a month there was a gale which keeled the bark over to the water for days on end. Even when Desolation was sighted it was three days before we could make any attempt at landing, the seas rolled so high. Everything on the *Daisy* was caked with ice from the flying spray.

"On the collecting trips when we finally got ashore, we would go out with guns and hammers, roped together in single file, Alpine fashion, because of the great danger of quicksand. A number of times one of the men would sink up to his shoulders. During all the time on shore we lived in caves."

There's a silence following the chuckles after this yarn and then another voice over in the darkness strikes up a tale.

"The ship *Hector*, 90 days out, raised a whale and lowered the boats for him. But this was one of those fighting whales and instead of the boats going for him he went for them. He struck the mate's boat just before the mate's harpoon struck him, and a big hole was stove in her. Sails were drawn under the boat and she was kept afloat, and the mate, who was a fighter himself, went after the whale again. The cap'n went for him, too, and the whale turned on the skipper's boat and took it in his mouth. Yes, sir, he held it end on end and shook it to pieces in a minute. This didn't satisfy this fellow and he chewed up every oar and boat's keg that floated his way. The men in the water were picked up by the mate and taken to the ship, and a fresh boat lowered

Right off the whale went for this boat and the skipper gave the order 'stern all.' The crew 'sterned all' and got headed back for the ship just as soon as possible and maybe a little mite quicker. And for half a mile that whale chased that boat, with the men rowing for their dear lives. He followed 'em so close, that crazy-mad fellow, that more than once his jaws came together within six inches of the boat. But the harpooner watched his chance and got his iron in the vital of the whale. When he was cut up they found two irons, one belonging to the *Barclay*, and it was afterward learned that the mate of that ship had lost his life in an encounter with him."

We'll leave them on the peaceful deck of the old *Charles W. Morgan* "gamming" away and planning the time when perhaps the venerable ship will square away again before a fair wind.

Visiting an Earthly Paradise; Damascus, Gem of the Orient

Concluded from page

Bedouin camp, tents of which were made of one piece of cloth to keep off the sun with an open space two feet below so as to catch all the passing breeze. Flocks of camels, horses and goats could be seen in the distance, while there were half a hundred horses saddled and bridled near the tents. We were fifty strong and armed, but we did not stop near the Bedouin camp, which extended on both sides of the trail (it isn't desert etiquette), but smashed through at top speed and came to a halt on the next swell of the plain. In five minutes or more we were surrounded by armed Bedouins on superb horses gaily decked with brilliant cloth and streamers. They were a picturesque crowd of ruffians, rifles slung across their backs as they came at full gallop across the desert. We held a short parley, and there was no question of "baksheesh"—whether due to our number and arms or to the vigilance of those silent soldiers along the route I never found out.

And then on again over the roughest stretch of road imaginable with no slackening of speed, for we could not be caught on the desert overnight. On the right as far as the eye could reach stretched the desert, interminable, and on the left in the distance were the mountains. Here and there were the Arab villages where whole populations lined the roadside in the late afternoon and welcomed us with loud clapping of hands, their gesture of welcome. Flocks of sheep and goats were encountered late in the afternoon plodding in a haze of dust at the heels of their shepherd, from the pastures to the towns, and herds of camels grazing upon seemingly barren ground, were scattered over the landscape. As the darkness descended the last daylight scene I remember was that of countless camels outlined against the sky on distant ridges.

It was late when we finally reached Homs, which is a typical desert city of 60,000 persons near the River Orontes and the Lake of Homs. There was a tired and dusty crowd in those cars after ten hours on the desert, and the only redeeming feature of the evening was that we were not asked to dress for the usual evening banquet given by the city officials. This was the first and the last occasion on the entire trip that we did not have to don evening clothes, for the French are sticklers for proprieties and we were an official mission which must live up to them. Many times we struck some smaller city where there was a reception scheduled, and, although there were no facilities for bathing as we know them at home, we had to be satisfied with those at hand.

Homs has a Catholic archbishop, an American Protestant mission and manufactures gold and silver thread, textiles and fine furniture. It is the meeting point of trails from the desert north and south and east and west, while the land around it is fertile for a certain distance. The meeting of these trails gives Homs its distinction to me, for I never saw so many sheep in my life as were driven through its streets the day I was there. One flock followed another in quick succession, sometimes two flocks going at right angles to each other, becoming indescribably mixed and only separated after herculean efforts on the part of their shepherds. I was told that at some seasons, and this appeared to be one of them, 100,000 head of sheep passed through the streets of Homs daily.

It was here I learned the meaning of the expression "fat-tailed sheep," and also came to understand the meaning of "green pastures and still waters." These desert sheep have a tail about six inches long, and about the same in circumference, broad and thick, which is wholly fat. When the pasture is poor they live on the fat of this tail as does the camel on his hump in similar circumstances.

We had passed a small desert village four or five miles out of Homs the night before but returned on the invitation of the sheik to have coffee with him. It was market day and Homs was crowded as we honked our way through the mob, scaring two country camels who were not accustomed to automobiles and who staged a runaway ahead of our car, while men, women and children scattered into convenient doorways.

The animals finally grew tired of the fast pace and turned into the open doorway of a stable and we cut loose for the desert. The newspapermen's car arrived first, so we had to bear the brunt of the welcome before we could explain that we were not the real show. This was done through a Syrian, dressed in natty American clothes and a straw hat of the latest shape, who singled me out as the only English-speaking person present. This man owned a grocery store and market in Jacksonville, Florida, I think, was visiting his home for the first time in many years and was returning to America within two weeks. I found others who had been to the States in this town of about 200 inhabitants. One man had his first papers but had come home on a visit before the war and could not return when it started, so his papers had lapsed.

Then there were half a dozen girls dressed in gala attire who had just attended a wedding of one of their number. The bride was dressed in a blue silk dress which her husband had brought her from America and they were to leave on the long trip to New York within a few days. She had the usual jewelry as a headdress and a necklace of American gold coins, with a double eagle in the center, all of which had been brought or sent her by the boy who had gone to America and then come back for her.

For so small a town the inhabitants were well traveled. Many had been to South America where they worked on farms or ranches, and all of these spoke Spanish which they were as proud to exhibit as were the others their English.

At the sheik's home, cross-legged on magnificent rugs in a one-story house, we drank our coffee with sweet cakes, while the crowd of villagers remained in the courtyard. In this courtyard was an oven built of clay, with a dome top and a doorway, a foot square, minus the door. At the bottom smoldered a fire and the cook was rolling out thin dough which she plastered on the inside of the dome, the heat of which cooked the bread on one side while the fire below cooked the other. When the upper side was done the bread, naturally, fell into the fire and the cook had to be on the job to save it.

There was one well in the small square of this town and a Greek church. Water was drawn from the well with a goatskin attached to a rope running over a pulley and raised by a horse on which rode a small boy. This youngster had to draw all the water for the town in this manner and seemed to enjoy the job. The church, although small, was a pretentious affair and in one corner I noticed a huge pile of wheat. This, the man from Florida told me, was how the parishioners paid their minister, the latter keeping the increasing hoard until he had enough to take to town and exchange for something he needed more. Incidentally, these farmers on the desert get about the equivalent of two dollars a bushel for their wheat.

Homs was our last stage by automobile for some days, and with a last look at the sheep and the town sprinkling cart, which consisted of a cowhide filled with water and slung on the back of a donkey, with a short hose to spray the street as the donkey walked, we boarded a special train for Aleppo, second in interest only to Damascus

France's Industries Rise From Their Ashes

Concluded from page 2

hills on the border of Spanish Morocco were French planes, and the machine guns with which the Riffs replied were also made in France. The French munition industry is the only industry in France that has not known any period of unemployment or short time since the war.

With the restoration to France of the rich iron and potash mines in Lorraine, and with the certainty, for many years to come, of cheap coke and coal from the Ruhr, France is now placed in a position of European industrial supremacy that is comparable only to the position that England enjoyed during the Victorian era. She is secure in her home market, by reason of the high English and American exchange rates, and she can reasonably look forward to a much larger market in Germany. France is also able to dominate the markets of the low exchange countries of Europe, including Italy, where the steel industry has lately been compelled to beg for an economic alliance with France, to get some of the iron ore from Lorraine and some of the blast furnace coke from the Ruhr.

This is the explanation of what one sees upon every street in Paris. London is full of sober, straight faces, but the people of France are light-hearted and gay. Part of this is temperamental, of course, but there is no denying the fact that France is prosperous—and looks it. Her shift from agriculture to industry is producing at least temporary benefits.

But how long can a country prosper that does not produce its own food, and is dependent for employment both upon the willingness and the ability of other peoples to buy its products? How long can such a country be safe?

U. S. Corps of Engineers Built the Big Ditch

Great Connecting Link Between Atlantic and Pacific Made a Reality by Their Skill

By HARRY PENCE

This is the second and concluding article of the series.

AT THE close of the Civil War General Dodge was assigned to the command of a western department and in 1866 resigned from the army to accept the post of chief engineer of the projected Union Pacific.

That undertaking not only presented many difficult engineering problems but the hostilities of the Indians made the work dangerous.

"The organization of the construction of the Union Pacific," General Dodge said, after its successful completion, "was upon a military basis; nearly every man had been in the Civil War; the heads of most of the engineering parties and all the chiefs of construction had been officers in the Civil War; the chief of the track-laying force had been a distinguished division commander and at any minute I could call into the field a thousand men, well officered, ready to meet any crisis or any emergency."

With such an organization General Dodge also built the Texas and Pacific Railway.

The Panama Canal

NO EFFORT has been made to emphasize the conspicuous achievements of the corps and of engineers in other branches of the service in actual war but their outstanding success in the Civil War cannot be passed by without mention. Most of the commanding generals, the commanders-in-chief of both armies and the president of the Confederacy were graduates of the academy, and historians seem to agree that the early victories of the Confederate army were due to the fact that Davis, Lee and their associates realized more keenly the immensity of the struggle before them and brought trained abilities into action and made more adequate preparations more quickly and thoroughly than did the civilian directors of affairs in Washington.

Another testimonial to the services of the army engineers and the efficacy of military methods is the Panama Canal. That "big ditch," just celebrating its tenth anniversary, was dreamed of long before the Suez Canal became a reality. It was, however, a much more difficult undertaking. The Spanish considered such a canal as early as 1550, but fearing for their monopoly of communication with that part of the New World rigorously suppressed even agitation on the subject for two centuries. Her Golden Age passed and when she changed policy her power had waned and European complications led ultimately to the loss of her American possessions. A Dutch company obtained a concession in 1830 but soon relinquished efforts to carry through its project. In 1878 Lieutenant Wyse, of the French navy, obtained the concession which later passed to the two French companies which De Lesseps organized, and finally to the United States.

For more than fifty years American engineers speculated upon the possibilities of an isthmian canal at Panama or elsewhere and urged this government to investigate its feasibility. Before and after the collapse of the French endeavor, a number of American commissions explored, examined and reported and ultimately and suddenly the Nicaragua route was discarded and the Panama route was decided upon through the vigorous action of President Roosevelt.

An Epic of Engineering

NAVY rather than army men were prominent on these commissions and the planning and construction of the canal were undertaken by a board of engineers of a wide range of training and practice.

After two chief engineers and the chairman of the commission had resigned it was determined to build the canal with hired labor under the direction of the Corps of Engineers of the United States Army. Colonel, afterward General, George W. Goethals, an expert and an instructor in civil and military engineering and builder of the Muscle Shoals Canal and locks in the Tennessee River, became the generalissimo of the enterprise.

As far as practicable and desirable, army discipline and military methods were introduced and in many respects the story of the building of the Panama Canal is not unlike that of the Union Pacific Railroad. The discipline, of course, did not extend to the workmen and thousands of civilian employes. There were no Indians to fight but an equally deadly, if insidious, enemy lurked in the very atmosphere of the Canal Zone. Fevers and other tropical diseases exacted a heavy toll of human lives until Army Surgeon-General William C. Gorgas, engineer in the conservation of health, became a human benefactor by devising sanitary and preventive means of eliminating these menaces.

It is within the realm of possibilities that the achievements of Surgeon-General Gorgas may some day be regarded as more valuable to humanity than those of General Goethals and that the third of a billion of dollars which the Panama Canal cost may have been well spent, even though the effort to build it had failed and only the control of yellow fever had been discovered.

But the canal was completed. Its only fault is that it has attracted a traffic that seems certain soon to exceed its capacity or its water-supply and already farseeing army engineers are at work on the problem of enlarging it, paralleling it with another "ditch" or constructing a second canal along another route.

We have seen that by the construction of the Erie Canal the army engineers did their part in making New York the metropolis of the United States. But for many years the commerce of the city and of the nation was restricted by the difficulties and dangers to navigation of the East River entrance to Long Island Sound. It was narrow, crooked and only expert pilots could steer clear of its rocky reefs. It had earned the name "Hell Gate." United States army engineers mined and blasted, out of solid rock, a channel 2,000 feet wide, increasing its depth from sixteen to thirty-seven feet. Vessels of that draft now navigate this channel without danger in all conditions of weather, even in fog.

Boston Harbor was also enlarged, deepened and made safe.

Between the Delaware capes a series of breakwaters have created a protected basin in which thousands of vessels find shelter during occasional and seasonal Atlantic coast storms, thus averting numberless shipwrecks and saving countless lives.

These are a few of the works of the army engineers in the seaports of the country and though among the greatest are but typical of many others.

Canalizing Inland Rivers

THE improvement of the inland rivers of the country, entirely an activity of the United States Engineers, comprises a chapter worthy the entire space of this article. It is possible here to refer to only one of these undertakings, the canalization of the Ohio River and its tributaries. The Ohio is nearly 1,000 miles long, flowing through one of the richest and best-developed sections of the country. Its tributaries penetrate ten states and drain an area of 200,000 square miles. Of these tributaries the Monongahela was canalized by a private corporation half a century ago and proved a profitable undertaking by levying toll on coal brought to Pittsburgh. The enterprise was subsequently taken over by the Federal Government, improved and enlarged and opened to free navigation. It now carries more than 20,000,000 tons of coal a year, the annual saving in transportation being about equal to the original cost of the series of locks and dams which provide 131 miles of slack-water navigation.

In its original condition navigation on the Ohio River was impeded in low-water periods by shoals and sandbars. Shallow draft boats operated less than one-third of the year in the upper stretches and had to remain idle nearly that time farther downstream.

Following the demonstrated success of the Monongahela improvements the government began the construction of a series of locks and dams designed to provide a nine-foot stage at all seasons of the year from the source to the mouth of the Ohio and this great work is now nearing completion. Besides the Monongahela, eight other tributaries have been canalized and when the Ohio work is completed a natural highway for economic transportation will be opened that has few equals in the world.

Men engaged in the work have become recognized authorities. Their reports and technical papers constitute a literature which, as it is all on file in the office of the chief of the corps at Washington and available for study and comparison, will prove of inestimable value to future workers in this line.

Lake Erie to Ohio River

SEPARATE from the river improvement labors of the engineers, but still one of their undertakings, officers of this corps are completing the Wilson Dam at Muscle Shoals in the Tennessee River, originally a war plant designed to develop a great volume of hydroelectric power.

Members of this corps are also planning ways and means whereby floods may be prevented or robbed of their power for destruction in the Mississippi River district and when their plans are mature they will be intrusted with the task of carrying them into effect.

For years these engineers have investigated many projects for the betterment of navigation and for flood prevention in the Mississippi River system. The feasibility of establishing storage reservoirs in the upper Mississippi district to provide water during dry seasons has been exhaustively considered, and ultimate efforts to carry out plans depend upon the probability of the improvements attracting a traffic that will make their cost economically justifiable.

In the pre-railroad era three canals of small dimensions, floating boats propelled by horse or mule power, connected Lake Erie with the Ohio River. They were important lines of traffic in pioneer days and such cities as Dayton and Hamilton, Ohio, owe their growth to them.

These canals fell into disuse after the advent of the railroads, largely because their primitive channels and locks allowed for only small barges and made impossible the use of self-propelled craft.

It is now proposed to reconstruct one of these canals on a scale that will permit power barges, with their tows, to ply between Ohio and Mississippi points and lake or even sea ports without breaking their cargoes.

The Dome of the Capitol

UNITED STATES engineers have already made preliminary examinations of this project and are now making surveys to determine which of several proposed routes is the most economic of construction and likely to develop the largest and most useful traffic. The ultimate necessity of such a waterway, which, unlike a railway, will be a free and unrestricted highway for the boats of all who desire to use it, is not seriously doubted. In addition to the engineering problems which it involves, the engineers will have to determine when the construction of the selected line ought to be built and, through the chief of engineers and the Secretary of War, make recommendations to Congress accordingly.

The Chief of Engineers, with the rank of Major-General, and his administrative staff have their headquarters in Washington but the lake regions, the navigable rivers and other sections of the country where works under the direction of the corps are in progress are divided into districts, with an officer of the corps resident in each district. The districts are grouped into divisions with a division engineer in charge of all the work in his group of districts. The district engineers take orders from and report to the division heads and they act under direct orders from the chief.

Washington, the National Capital, is in many respects the most interesting and by many is regarded as the most beautiful city in the country. When it was established in the wilderness forty miles from Baltimore there was no corps of engineers nor any native engineers and architects capable of planning the city or designing its buildings. Pierre Charles L'Enfant, a French military engineer, submitted the ground plan which has been followed with great fidelity. James Hoban, a native of Ireland, won the prize for a plan for the Executive Mansion, popularly known as the White House. A French architect and an English draughtsman divided and quarreled about the honor of designing the Capitol. Little of the work of either is manifest in the present structure and much of the construction and reconstruction of the building was done under the direction of United States Army engineers. They built the massive dome which is justly regarded as its most distinctive feature.

Master Builders

IN TIME the corps of engineers became the master builders of the city and the district. They designed and built most of the magnificent homes of the departments of the Federal Government and the public municipal buildings. They laid out, developed and now maintain the wonderful park system. Public utilities also come within their province. They built and maintain the water supply and the sewage systems and are the constructors and operators of all the public works of the city and the District of Columbia.

The famous Washington Monument was begun as a popular tribute to the Father of the Country. Funds and the constructive skill available proved unequal to the undertaking and for twenty years a formless stub, 156 feet high, remained rather a reflection upon than a credit to its projectors. Congress then aided the society by authorizing the Corps of Engineers to complete the monument. This they did but not until they had reinforced and enlarged its foundations.

Although it was inevitable that many institutions should follow the academy at West Point as training school for engineers and although the Rensselaer Polytechnic, the Massachusetts Institute of Technology, the Rose Polytechnic, and others, have been giving the country men to direct its industrial and commercial development, the Corps of Engineers of the United States Army still remains a big factor in the civil engineering world.

Routing Ignorance by Sending Education to Appalachia

Caney Creek Mountaineers Are Shown How to Overcome a Handicap of Three Centuries

By GEORGE H. DACY

MRS. ALICE SPENCER GEDDES LLOYD, the mortal goddess of Knot County, who has created and developed the best system of community centers in the southern states.

IN THIS age of automobiles, airplanes, radiophones and innumerable mechanical marvels, can you conceive a rural county containing more than thirty square miles of land area where there are no railroads, telegraph or telephone systems, no free rural mail delivery nor a single mile of improved highway? In your most fantastic imaginings, did you ever even suppose that there were still thousands of persons in the United States who have never seen a railroad train? Do you appreciate that there are untold thousands of mountain children who never saw the sun rise or set over a flat horizon and who would be terrified if they saw the big golden orb straight in front of them, sinking over a prairie skyline? Do you know that there are millions of mountaineers who live in the Appalachian chain of the southern mountains who are still practicing eighteenth-century methods of living, farming and doctoring? In this era of educational advancement and common-sense culture, do you know that there are still many southern districts where ignorance is prized as an asset instead of being classified as an economic handicap?

Entering the Creek of Caney. Most of the roads are in the streams.

Assuredly, it is a great lesson to us to see how some of our compatriots live. No revelations can be more remarkable than those offered by a trip to the highlands of Appalachia where a backward civilization has been for years topsy-turveying the lives of purebred, full-blooded Americans that date back to some of the best foundation stock that ever populated the eastern and southern states. By birth, these mountaineers are real Americans. They are of a robust, sturdy, hardy stock of pioneers. Due to topographical handicaps and isolation in inaccessible districts, these people have remained stagnant and have continued the precarious practices of pioneering while the rest of the country has developed and progressed. Hundreds upon hundreds of mountain families who live in obscure hollows and up the creeks and forks and branches of highland streams do not know the elementary principles of how to live, how to bring up their children, how to keep well nor how to gain happiness and pleasure from life.

In the districts of perpendicular fields, the cabins are rough, crude and windowless. None of the mountaineers even know what sanitation means. Many families in the remote highland regions operate on a budget of less than twenty-five dollars in cash a year. Pork and corn are the two standard crops. Crop rotation is an unfathomable mystery in this land of crags and rocky slopes. The hogs rustle a living in the woodlands and are fed corn for a month or so before butchering time. The soil is never fertilized. As the fields on the lower slopes are depleted, the cropping of corn is transferred to the higher and almost perpendicular heights. It takes a pioneer endowed with all the agility of a Toggenburg goat to plant the seed and tend the corn crop. Eighty per cent of the mountaineers are afflicted with hookworm. Those that have escaped this malady are either halt, lame or nearly blind. If one could corner the despondency and "blue Monday" market and concentrate all such sufferers in a congested area, he would, to a certain degree, have duplicated the community commonplaces and holdbacks that have impeded the propitious growth and development of the Appalachian mountaineers.

If you can conjure up visions of the worst living conditions under the sun, if you can conceive a people who were content to let well-enough alone, if you can imagine communities that had never even had any morale to lose, if you can visualize the conditions which would result in an entire county where there were no public schools, you will have a faint idea of what Caney Creek and Knott County, Kentucky, were seven and one-half years ago when Mrs. Alice Spencer Geddes Lloyd first visited that rough-and-ready section. After special studies at Radcliffe College, Mrs. Lloyd had gone into newspaper work. She was associated with the Boston *Globe* for years. Then she engaged in settlement work among the lumber camps of New Hampshire. She heard about the terrible conditions under which the mountaineers of Appalachia were living and decided to spend her vacation looking into conditions in Knott County. By chance she came to Caney Creek; she remained to aid the benighted people of that illiterate section. Her achievements during her seven and one-half years in Knott County have been outstanding despite the fact that she is an invalid and crippled. Experts of the National Bureau of Education say that she has developed the best system of community centers now operated anywhere in the United States.

At first, the mountaineers were suspicious of Mrs. Lloyd. They were aloof and even suggested brazenly that the sooner she left the community the better pleased they would be. By kindness, patience and perseverance, Mrs. Lloyd finally won the friendship of a few of the families that lived in the hollows, coves and creek branches. She nursed the sick; comforted the helpless; taught the ignorant and won the friendship of the children. She lived in a one-room plank shack, as humble a hovel as there was on the mountain slopes. Gradually she interested the children in coming daily to her shack where she would tell them stories and teach them their letters. In time, she had laid the foundation of a sort of one-ring school.

Through the children, she won the interest of the parents and the old "grannies" and "grandads" of the hills. Finally, unsolicited they requested that Mrs. Lloyd help them to get a little book "larnin." That was how the twilight-school idea found inception in Caney Creek. Mrs. Lloyd's cabin was too small to accommodate all the adults that came to her night classes, so the school met outdoors. She secured a number of sets of spectacles, for many of the old people could not see to read. The next article of equipment was a gasoline lantern which enabled the classes to continue after twilight had waned.

Radcliffe Cottage, funds for which were donated by Radcliffe girls.

Mrs. Lloyd wrote to each graduate and student at Radcliffe College asking them to send two dollars apiece to aid in securing a meeting place and establishing a community center. The replies were numerous and enough money was secured to purchase a four-room, knock-down, portable house. This house cost $450. To illustrate how impossible the transportation facilities were in the rough and rugged confines of Caney Creek, it is worthy of mention that it cost $500 to freight the house from the railroad, twelve miles distant, up and through the mountains to the desired location. It took three months of hard work for the mountain people to haul, heave, push and shove the portable sections of the building up the creek beds which served as the only available roads. Finally, Radcliffe Cottage was delivered and set in place. It is the hub of one of the most efficient systems of human reclamation ever established under the Stars and Stripes.

Not to be outdone by their Radcliffe rivals, the girls of Wellesley College responded nobly to Mrs. Lloyd's request for assistance. Enough money was raised to build Wellesley Recreation Hall which provided a simple rural school, a free circulating library of 10,000 volumes, moonlight school for adult illiterates, an assembly hall for all public gatherings, a place where religious meetings could be held, a local court where justice could be administered, a small space to be used as a post office, and a meeting room for the Caney Creek Civic Club which was organized by Mrs. Lloyd. The students of Smith College and Hampton Institute financed the building of the Smithhampton Industries Building which provided adequate quarters for the manual training and household science activities of the community. In addition to aiding the community center work by contributions, several of the college girls volunteered their services to aid Mrs. Lloyd in the instructional work and organization and operation activities of the community center.

One college girl who came to aid Mrs. Lloyd the first winter she lived in the Caney Creek community had been trained as a nurse. She introduced a new era of health and sanitation among the mountain families. From dawn to sunset, daily, she was in the saddle—the only way she could get about was on horseback—visiting the mountaineers, caring for the sick, instructing mothers how to raise and feed their infants and children, preaching the doctrines of education and sanitation wherever

Routing Ignorance by Sending Education in Appalachia

Concluded from page 13

she went. A doctor had never visited the great majority of the crude shacks and cabins that were the homes of the mountain people. They used the simple medicines and herbs of the pre-Revolutionary days and if these remedies were not successful, the patients usually died. The equestrian nurse saved many lives during her first year at Caney Creek. Soon the demands for her services were legion. They poured in from remote coves and creeks in adjoining communities. She paved the way for the Mary Upson Rose Memorial Hospital with a free dispensary and out-patient department which is now the mecca of the suffering and afflicted of Knott County.

The girls of Mount Holyoke College heard about the remarkable work of Mrs. Lloyd in the Caney Creek section. Not to be outdone by their associates at Radcliffe, Wellesley and Smith, they raised $3,500 which they sent to Mrs. Lloyd to build a public school. Despite the fact that it is almost a pauper county, Knott County then came to the front with a pledge to give $1,500 each toward the erection of five model schools as the nucleuses for five additional community centers. Mrs. Lloyd and the Caney Creek Community Center assumed the responsibility for the construction, equipment and superintendence of these schools which were built during 1919 and now compose the framework for a chain of the best community centers in existence.

"My plan is to let the mountaineers organize and run their own community centers," Mrs. Lloyd told me during a recent interview. "I raise the money one way or another to give them a start. I make suggestions as they seem advisable but, for the most part, I turn the matter over to the board of trustees which is elected by popular vote after the individual communities have requested that community centers be started in their localities. The mountain people make mistakes but they are valuable mistakes as they enable the hill folk to learn by experience. Furthermore, the entire responsibility of the projects rests with the leaders who as a rule react favorably to such cares and worries. Our plan is the Americanization of true Americans by Americans. The results are coming slowly—but they are coming. Every month, new sections petition the community centers now in operation for assistance so that they also can lay the foundation for the potential education and social enjoyment of their people."

The Knott County community centers organized by Mrs. Lloyd now consist of Caney Creek, Beaver Creek, Maytown, Bonanza, Banner, Big Mud and Betsy Layne. Approximately 4,000 mountaineers compose these social and educational centers. Altogether twenty-four substantial plank buildings have been constructed. They consist of schools, assembly halls and branch libraries. The library at Caney Creek reaches 25,000 mountaineers who are enthusiastic supporters of Mrs. Lloyd and her novel system of rescuing an illiterate people from the bondage of ignorance and retrogression. Sixty branches of this free library have now been installed in as many small schools which have been organized throughout the mountain sections. The Maytown Community Center has already reached the status where it is self-supporting and the other associations are gradually progressing along a similar trail.

At Caney Creek, Mrs. Lloyd now runs a training school where the best and brightest mountain boys are trained for missionary work among others of their people in the remote districts who have not yet been reached. There are 165 pupils at this school; 50 have graduated and begun their missionary labors. There are more than 4,500,000 ignorant mountaineers in Appalachia—a neglected asset of true Americans who feud, make moonshine whisky and shun schools and modern civilization chiefly because they know no better. The Lloyd training school provides residence accommodations for 80 students—boys selected from the different community centers who have shown marked prowess in leadership, scholarship and general ability. These boys pledge themselves to return to their home counties when their training is completed and to teach, guide and direct their fellow men along the paths of progression and improvement. A few boys are sent to technical and medical schools for additional training. Mrs. Lloyd raises the funds for their education. They promise to return so that their mountaineer neighbors may reap the benefits of their scientific skill and knowledge.

Community Center Cottages

AT Caney Creek Community Center, Mrs. Lloyd has also built a number of simple cottages—the center operates a sawmill of its own and now owns a small forest of oak trees—where the girls of the mountains can come and learn the rudiments of housekeeping and homemaking. This method of training the future housewives of the hills in the ABC's of cooking, sewing, cleaning and general sanitation about the home is eliminating the filth and squalor from the ordinary mountain cabins. A group of six girls may be assigned to one of the community center cottages. For a week at a time each of the girls performs special tasks for which she is responsible. One is cook, another tends to the garden, cares for the poultry and milks the cow. A third keeps the house clean and orderly. Still another will wash and care for the clothes and dishes. The fifth girl does all the sewing for the cottage and its occupants, while the sixth girl makes up the menus and tends to the purchasing at the community stores. At the end of the week, the girls trade jobs. In this way, in the course of several months, they all have been schooled by practical experience in every problem connected with the running of an ordinary home.

Mrs. Lloyd, the mortal goddess of Caney Creek and the savior of more than 25,000 hill people who have benefited from her kindness and aid, has already worked wonders in preventing the marriage of first cousins and the marriage of young girls only 14 to 15 years of age. Heretofore about the only society provided by the hills has come through marriage. That is why girls have married so young. Furthermore, the women of the mountains have been treated like white squaws by their "hill-billy" husbands who have made them do all the rough work connected with running the home. The words "women" and "work" have long been synonymous in mountain parlance. In fact, the average hillman always refers to any tool or implement which he uses for work as "she" or "her."

The effect of this life of drudgery on the women is aptly illustrated by the case of a certain mountaineer who unexpectedly received a check for $75,000 from a company which had purchased the oil and coal rights on his mountain lands. Overwhelmed by the magnitude of the bank account which so suddenly came to him, the hillman sought his wife and said, "Maw, we're rich now. You kin have 'ary thing you want. What shall it be?" "Maw" reflected for a few minutes and then replied, "The blade of my axe is powerful poor. Do you reckon you kin git me a new one?"

An Experimental Farm

JUST to show the benefits which come from "booklarnin'," the action of one of Mrs. Lloyd's schoolboys who secretly returned home and demolished his father's moonshine still is outstanding. This lad learned at the school that whisky led to evil and that Uncle Sam by law prohibited its illicit manufacture. These facts were merely incidental in the daily lessons of the boy, as Mrs. Lloyd has always refrained from direct attack on the moonshine-making and the religion of the hillsmen. Notwithstanding, this youngster learned that it was wrong to make illicit whisky. Hence, he wrecked his father's still and was able to convert his parents to his new way of reasoning. This only illustrates what remarkable results obtain in Appalachia as a result of educating the younger generation.

An interesting feature of the Caney Creek Community Center is the 150-acre experimental farm where the mountain boys and their "daddies" are being trained in the fundamentals of crop rotation, livestock husbandry and the prevention of soil erosion. The steep mountain sides provide ideal conditions for sidehill washing and erosion. Mrs. Lloyd is now teaching the hill farmers how to terrace their fields to avoid such losses of fertility and soil. She is showing them how to fertilize the crops, how to feed the livestock. She is preaching the doctrine of purebred livestock to replace the scrub and mongrel breeding animals which commonly are maintained. Farming at best is difficult in Knott County due to the steep hillside fields. In the Caney Creek section there is not enough level land for a basketball court.

When Mrs. Lloyd came to Caney Creek only a few of the mountaineers had ever seen an American flag. One old "grannie" came to see Mrs. Lloyd one day and fell captive to the beauty of the Stars and Stripes. As she was leaving, she said, "Will thee not give me the pretty," pointing to the flag, "I want to make a rug out of it."

Conditions are quite different now in Knott County. Mrs. Lloyd has purchased and erected thirty-seven American flags and flagpoles at as many different mountain schools. The children at each school are taught how to salute the flag. They are instructed to venerate the starry banner as the emblem of liberty and freedom. The children have carried home the stories about the American flag and now practically all the mountain families that have been reached from Caney Creek and the adjoining community centers respect and pay homage to our national ensign.

Another worth-while accomplishment among the many achievements which Mrs. Lloyd has consummated is the organization of thirty citizenship clubs among the hills and valleys of Knott County. These clubs develop the civic responsibility of the mountaineer. They educate him concerning the need for schools, good roads and country improvements such as community nurses, hospitals and better methods of farming. One of the great drives of these citizenship clubs has been to arouse all the people of Knott County so that they will appreciate the dire need for good roads in place of creek bottoms as modern highways. The *Beacon Light of Knott County*, a small and novel newspaper published, edited and printed by the high school boys in Mrs. Lloyd's training school—it is the only newspaper published and circulated in Knott County—has aided greatly in this campaign for a few miles of good roads in Knott, the most curious county in the country.

Democrats Indict Government's Record

Concluded from page 5

for the vitally important post of solicitor-general of the United States.

Here again he exceeded the requirements of his situation. For five years he appeared almost daily before the Supreme Court of the United States, arguing the government's side of all Federal cases that go to the highest tribunal. There he met the greatest legal minds of the country, arrayed in opposition on the other side of the counsel table. He not only held his own, but he distinguished himself so markedly that at one time the Supreme Court itself requested President Wilson to appoint him a member thereof.

Mr. Wilson, however, had other important work for Mr. Davis. He designated him Ambassador to Great Britain, and here once more Mr. Davis exceeded the requirements of the circumstances in which he found himself. He attracted world-wide attention as a diplomatist, and returned to the United States at the close of the Wilson Administration, to take a partnership in Grover Cleveland's old law firm, one of the largest in the country, and to become, very shortly, the president of the American Bar Association, and admittedly one of the three or four ablest lawyers of the country.

Mr. Davis' capacity to discharge with distinction the duties of whatever position he is called upon to occupy, as well as the particular training he has received through the life he has led from boyhood, fits him perfectly for the office of President. This explains why so many people, irrespective of party, say, "John W. Davis is better qualified to be President than any other man in the United States."

In presenting Davis and Bryan and the Democratic party as the only agency through which the people can have honesty and progress at home and honor abroad, we must call attention to corruption and dishonesty in government, which cannot be forgotten or ignored merely because a little time has elapsed since it was revealed.

The important thing is not, actually, that there was the most frightful graft, scandal and corruption under a Republican administration that has ever shamed the country, but the fact that not one Republican, from the President down, ever lifted his finger to help uncover it. On the other hand, every Republican official, who took any part whatever in the investigation, did all in his power to prevent exposure, until after the bribery of a member of the Cabinet had been revealed. Up to that point all the power of a strong Republican administration, backed by a strong Republican majority in Congress, was used to block discovery of crookedness.

What the Party Promises

THIS was true of the oil scandals. It was true of the Department of Justice scandals. It was true of the Veterans' Bureau scandals. Since then three members of the Cabinet have been ousted. One of them is under indictment, and the Veterans' Bureau head, finally forced out, is also formally indicted on graft charges. If the investigations had been left to Republicans, all these men would still have been in office, continuing the reprehensible practices which have shocked the country.

The Republican party under its present leadership cannot escape responsibility for this condition. When it asks for a return to power, in the face of these corrupt scandals, it asks the country to endorse Fall, Daugherty, Denby, Forbes and the whole scandalous chapter in which they figured.

If the Democratic party were destitute of record, instead of having a record for honesty and progress that cannot be matched in the history of the nation; if the Democratic party had a mediocre candidate instead of one of the ablest men of the generation, then the corruption and scandals of the Harding-Coolidge Administration alone would justify the election of the Democratic ticket. But when the Democratic party offers honorable, intelligent association with the nations of the world, to the advantage of Americans; and when it promises a liberal, constructive domestic program backed by successful performance; and when it presents a candidate who is universally recognized as the best-fitted man for the job in the country, then the reasons for the election of the Democratic ticket become overwhelming.

Progressives Submit a Militant Program

Concluded from page 5

without discrimination to business men, farmers and home-builders.

Today the Federal Reserve System and the Farm Loan System are both absolutely controlled by the big financiers—the people who *sell* credit and capital. In the proposed reconstruction of these systems, special provision will be made to insure that the users of capital—the farmers, merchants, manufacturers and home-builders who must *buy* credit—will be given the representation to which they are entitled. Special legislation is also proposed for the reformation of the marketing system, so that the farmer will be able to secure a larger share of the price which the consumer pays. Official investigations have demonstrated that the farmer gets only forty cents out of every dollar paid by the consumer.

Senator La Follette is convinced, by his studies last year in Denmark and other countries which have highly developed co-operative systems, that it is possible to increase enormously the farmer's share without injuring the consumer. In Denmark, the farmer receives eighty cents out of every dollar paid by the consumer, and there is no reason why similarly beneficial results should not be secured in the United States—unless we are willing to admit that we are less intelligent and enterprising than the Danes.

Finally, the Progressive candidates believe there can be no permanent prosperity in the United States or any other country until the war menace has been removed. La Follette and Wheeler have proved that they stand for peace. They kept cool and worked for peace while the world went war-mad.

The program which they have outlined in their platform means "No More War." They propose by firm treaty agreements to abolish conscription and drastically reduce land, air and naval armaments. They know that without conscript armies at the beck and call of the imperialists and the militarists war can be waged only when the people want it. They know that the people never want war. They, therefore, propose also by firm treaty agreements to provide for public referendums on peace and war, so that the people may vote whether war shall be declared and whether their sons shall be sent to the sacrifice.

The complete program which the Progressive candidates offer is designed above all to restore control of government as fully as possible to the people. It does not endanger in the slightest degree any legitimate business or any honest enterprise. It means peace and prosperity for all the people.

Popular Heroes of the Baseball World

Some Physical Characteristics of Giants of Sport Are Lightly Touched Upon

By PAUL MACDONALD

BATTING and fielding averages give players their rank in the record books but not with the vast army that follows baseball. Personality is a more valuable thing than the averages, and the record books do not estimate personality. Reputations are made by performances on the field but not by that alone, for some physical peculiarity of the player or an odd name has often proved far more valuable and raised the player possessing them over men with greater batting and fielding skill.

Several years ago, the New York Americans had an ordinary player named Conroy but during his stay in the major leagues he was better known than the majority of players for no other reason than that he carried what was probably the oddest nickname the sport has known. Conroy had been dubbed "The Widow" and the nickname was so unusual that the impression grew that Conroy must be an unusual ball player. Later on the baseball patrons grew tired of calling him "The Widow"; that was too long. They abbreviated it to "Wid" and Conroy remained "Wid" during the remainder of his baseball days. He never got beyond ordinary ability but the nickname carried him along and kept him popular.

Old-Time Favorites

LAVE CROSS was better than the average ball player but he never performed up to the reputation he had and this reputation was based upon a pair of bowlegs. Cross is reputed to have owned the most pronounced bowlegs ever on exhibition in sports. The like of them was never seen before nor since. John P. Wagner, the famous Hans or Honus, of the Pittsburgh Nationals, was famous for huge hands and bowlegs but the legs of Honus looked like those of Apollo compared with the legs of Lave Cross. People paid to see Cross play because of his legs and they stayed until the end of the game for the same reason that many people stay for the juggling act in a vaudeville show. The jugglers generally close the bill and a good part of the audience likes to see the act because of the chance that one of the jugglers will drop something. When Cross played the fans wanted to see the batter drive the ball to Cross at third base with the hope that the ball would skip through the almost perfect arc described by Cross' legs. Whenever the ball got through the long wait was well rewarded.

For more than a decade John Titus was a big favorite as a member of the Philadelphia Nationals. The chief reason for his popularity was that John could easily be picked out on the field of play. Titus wore the most impressive mustache in baseball. There have been many mustaches worn in this field of amusement but they were mostly long and scraggly affairs, badly kept. Their owners had little pride in them. Not so with the mustache that John Titus wore. It was a thing of refinement, black and businesslike, always neatly trimmed and turned. It distinguished him and set him apart. Fans recognized him by the mustache and it kept him in the game after his allotted time. He was extremely popular.

For similar reasons John Remsen, who played for St. Louis 40 years ago, was popular. Remsen was the best fielder in his league but it requires more than simple fielding ability to put a player up and keep him there. Remsen was up with the patrons of the sport; among the idols of his day. What made him so popular was that he wore a full beard. He kept it full and prided himself on it. He was easily distinguished by the beard and got his pictures into the papers because of it. There were better players in his day but none of them more popular than Remsen. He stayed a long time, for he became part of the color of the game and patrons wanted to see him. The sight of Remsen, with long flowing beard, chasing a fly ball was well worth the admission price to the multitude.

Had the Largest Calves

CHARLIE HICKMAN was an intelligent ball player. That is one reason he remained in big league baseball as long as he did. Another reason was his calves. It is said that Hickman had the largest calves of any man that ever played the game. He was a good hitter but toward the close of his career he never got anything but singles. No matter how far he hit the ball Hickman's calves were so large that they did not carry him beyond first base. Still, he never lost popularity even in the waning days of his career. His calves had been so long discussed that they made him one of the leading figures of the game.

Denton T. Young, better known as "Cy," was one of the greatest pitchers of all time. People used to come to the ball parks to see Young pitch for he did that with rare intelligence and success. But Young developed color at the height of his career. This "color" came in a steadily increasing waistline. Young soon had the largest waist measurement in the history of the game and it increased until he passed from organized baseball. But even after the belt line was so expansive that it was impossible for Young to stoop over for batted balls he was popular because of it. They liked him all the better because his paunch was so big that he could not field.

"Ping" Bodie stayed on in the majors after he was regarded as through with the big leagues. Bodie had difficulty keeping down his weight and later failed entirely. He became a roly-poly sort and his rotundity brought him vast popularity. Bodie had great difficulty in running but they liked him all the more, which is one of the peculiar phases of what is termed mob psychology.

Carl Weilman, who used to pitch for the St. Louis Americans, had little color as color goes in sport but Weilman was one of the tallest men engaged in any sport. As a pitcher he had one unusual accomplishment and that was beating the Detroit team. He did this eight times in one season, a record for any pitcher. But it was his height that made him an uncommon man among ball players.

Byron Harris, of the Philadelphia Americans, is distinguished for the same reason. Baseball patrons like to see him pitch because it gives them an opportunity to see Harris bat and Harris' style at bat is unique. One of the tallest and thinnest players of all time, Harris is extremely awkward and when he bats everybody hopes he will hit the ball because they like to see him run. When Harris runs he presents one of the most unusual sights in baseball. His extreme height and his slender build set him apart.

Ty Cobb and Babe Ruth

THE late Addie Joss had a combination of peculiarities. His one-syllable name, extremely odd but easily remembered, would alone distinguish him but besides that Joss was very tall. Unlike Weilman, Harris and some of the other giants the game has known, Joss was graceful and he had greatness as a pitcher, delivering one of the few no-hit, no-run, no-man-reach-first games that has been produced in baseball. His name, his height and his ability combined made Joss one of the leading stars of the game.

The greatest individuals, from the standpoint of "gate attractions," are Ty Cobb and Babe Ruth. Both men owe part of their popularity to their names. Here are two names of one syllable each, easily remembered. As far as we know Ruth and Cobb are the only players of their names who have ever stepped out of the ordinary run of baseball. Each is spectacular but much of the glamour of their deeds would have been removed had they been named Smith and Brown. There is nothing out of the ordinary in names like Smith and Brown. Cobb as Smith would have been just another Smith and Ruth as Brown just one more Brown. Not alone were they blessed with unusual last names but their given names were out of the ordinary, Cobb's by baptismal right, and Ruth's by popular acclaim. There has never been another player with the first name of Tyrus in the game and while there have been innumerable Georges, which happens to be the first name of Ruth, the nickname of Babe sets him apart and removes his entire name from the commonplace.

Names with ball players are much like names in trade. The important thing to a manufacturer is a good trade name, something easily learned and remembered, something that appeals to the ear. In this respect Cobb and Ruth were fortunate.

Samuel Crawford used to be a barber in Wahoo, Nebraska. Then he began playing baseball and showed unusual talent in batting. He soon reached the major leagues and became one of the great sluggers of the game. Crawford was never a colorful player, although a mighty hitter, but the nickname of "Wahoo Sam" gave him a touch of the unusual with which his style of playing failed to provide him. The nickname was of immense value to Crawford, who never acquired the magnetic air.

A Colorful Player

JACOBSON, centerfielder for the St. Louis Americans for years, was likewise a colorless player. He was a good fielder and a fairly good batsman but his style was never sensational; he had nothing about his system of play that distinguished him. Still, Jacobson was for years a drawing card. Of immense stature, he acquired the nickname of "Baby Doll" early in his career and it was this nickname that made him well-known, rather than any ability to hit or field.

When Walter Johnson was making his great reputation at Washington his catcher was Street. Now Street was an ordinary catcher. But Street talked much and earned the nickname of "Gabby." The nickname caught the public fancy. Johnson was never hard to catch; there have been any number of pitchers whose deliveries were much more difficult to handle but "Gabby" saw that the impression got around that only he could handle the fast ball that Johnson pitched, an impression that was demolished when Street left the Washington club and others were called on to receive Johnson. Street had the nickname and besides that he caught a ball thrown from the top of the Washington Monument, a feat that gave him added publicity.

"Gavvy" Cravath, who was the home-run leader in the National League for a while, also found a nickname of considerable value. He was not nearly so colorful as the nickname.

"Dazzy" Vance, one of the leading pitchers in the National, can credit much to his nickname. Some years ago Vance had a friend who was a cowboy. This cowpuncher had a pet expression. Anything that pleased him was a daisy. But he did not pronounce it as daisy; with him it was always "dazzy." Vance adopted the expression and so did the baseball followers; they tacked it to Vance.

Picturesque Nicknames

THERE have been names so difficult to pronounce that their owners gained wide reputations on that account. Such was the name of Bill Wambsganss. No one ever seemed to be able to spell the name, and to overcome the difficulty baseball writers who seemed never able to learn the number of n's, s's, g's and b's in Wambsganss, finally got around the difficulty by calling him Wamby and let it go at that. In the box scores, printed in the newspapers and set one-half column wide, there was never room for the full name and so it always appeared as Wamby and Wambsganss finally decided it would be best for all concerned to relieve the minds of fans so he had the name legally changed to Wamby. But, as Wamby, he can never get the publicity that he got as Wambsganss, even if the name was never spelled correctly or if spelled correctly only by accident.

Years before the arrival of Wamby in the major league circles there was another player who had a name so long that it could never be jammed into a typed score. This was Abbaticchio of Pittsburgh. His name caused great commotion whenever it came up, either as to pronunciation or spelling, or both. The only time it ever appeared in full was in the official batting and fielding averages; at all other times Abbaticchio had to be content to see his name appear as Abby. He topped Wambsganss by just one letter, a close victory indeed but giving him the distinction of having the longest name the game has known.

One of the commonest nicknames in baseball has been "Buck." There have been innumerable "Bucks." Any time a player is named "Buck" it is a mark of esteem or affection. Among the more famous of the "Bucks" may be mentioned—Ewing, Freeman, Herzog, Weaver. The major league lists also have been fairly well sprinkled with "Kids," among them Elberfeld, Gleason and Nichols. And the "Heinies"—Groh, Wagner and Zimmerman. Some of the lesser lights have carried these nicknames and all of them owed part of their popularity to the names by which the bleachers knew them best.

Feet Caused Discussion

FEET have always caused much discussion in baseball. Players have a habit of making reference to feet, whenever they are of unusual size. No one seems to care for the honor of owning the largest feet in baseball.

Frank LeRoy Chance, when he played first base and managed the great Chicago Cubs team, was known among ball players as "Clubfoot" but the general public never called Chance that—while he was within earshot.

His feet helped Heinie Wagner gain a reputation as a third baseman and they also helped the Boston Americans win ball games. Wagner is reputed to have the biggest feet that ever stepped across a diamond. When Bill Carrigan was the star catcher of Boston and Wagner the third baseman of the team, this pair caught more runners off base than any pair in the game. Carrigan would make a snap throw to Wagner and Wagner would shove one of his enormous feet across the base line. It is said that no runner was ever able to get over Wagner's feet in his effort to return to the bag.

Wagner's feet were for years the pet subject of the cartoonists of Boston newspapers. They began drawing the feet of Wagner when the training season began in spring and continued using them until the season ended. No matter how scarce the subjects for cartooning there were always the feet of Wagner. It was publicity that gained him much renown and helped keep him before the public.

And so you have feet and calves, legs and arms, height and weight and names, all methods and means of getting the player before the public and keeping him there, often after his playing ability has passed. Individuals that are classed as "gate attractions" are valuable in any sport or amusement enterprise.

BRIEFLY TOLD

The powerful Maybach motors, which have been installed in the Zeppelin ZR-3, for her trip from Germany to this country, are capable of running 1,000 hours without overhauling, according to American aeronautic experts who have examined the craft. The best record attained by American-made motors is 500 hours of continuous use.

During the World War only 1,849 American soldiers were seriously affected by chlorine gas, and of these only 7 died.

Railroads of the United States handled 70,000,000 pieces of baggage during the year 1923.

The National Lumber Manufacturer's Association has estimated that forest-fire losses this season in California, Oregon, Washington, Montana and Idaho amount to $4,250,000. Of this, $3,000,000 represented the loss of standing timber in the national parks and forests; $500,000 damage to privately owned standing timber, and an equal sum for logs and logging equipment; $250,000 in losses to settlers and community property.

Japan has a land area of 147,000 square miles, or about one twenty-fourth that of the United States, while her population is 56,000,000 or one-half that of this country.

The chicadee often devours more than 450 eggs of plant lice in a single day. It also eats at least twenty cankerworms a day during the activity of these insects.

Pencils made from lead bullets, bone buttons, button cutters and many other old Revolutionary relics were recently unearthed on the site of the original camp of the Continental forces at West Point.

At noon each day the sun's rays are focused on the touchhole of a cannon mounted at the Pena Castle at Cintra, Portugal, and thus it is automatically fired.

Hailstorms in India frequently are of such violence as to kill people. There is a case on record occurring in the Moradabad district on May 1, 1888, when about two hundred fifty persons perished in a severe hailstorm.

A noted authority on whaling estimated that in 1853 as many as 30,000 gray whales were present on the California coast; during the period from 1919 to 1922 only one was captured there.

A combined clockwork and hand-played carillon of fifteen bells in London plays mechanically five hymn tunes and one hundred and thirty changes on ten bells. The largest bell, the tenor, weighs more than two and a half tons.

Liechtenstein, snuggled away in the green valleys that separate Austria from Switzerland, is a country about sixty-five square miles in area. It was not involved in the World War and is without public debts or taxes. Its currency is sound, the cost of living is low, and prosperity is general, poverty being unknown.

The United States Bureau of Mines has approved a new type of electric safety lamp for the miners. It produces three times as much light as the previous types, while the battery and lamp together weigh but a third as much as the older designs.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

"Inert wealth has no power. Wealth in motion is power. And many of the greatest leaders in finance of today are not men of vast wealth, but those who, through their qualities of care, initiative and justice, keep large bodies of wealth in useful motion."—*Charles G. Dawes.*

Approximately two-thirds of the present forest cut is lost in the processes of conversion and through inefficient use.

Improved methods of manufacture are responsible for the reduction in price of insulin, specific for diabetes, from $14.16 a patient to $7.03 a patient.

The old Holland windmills are slowly but surely going down before modern machinery. The electric pump is more efficient.

The old Baltimore shot tower, which has stood as a landmark at Fayette and Front streets for almost one hundred years, will be purchased by the city and preserved, if efforts of a number of organizations and citizens are successful.

Texas has a prison farm without locks, guards, dogs or guns. The keeper is the honor of the convicts who have been picked by the managers of the five white prison farms for their good behavior, willingness and trustworthiness.

A cable railway is to be built up Mt. Fuji in Japan.

The United States Department of Agriculture is giving away some thousands of mule deer which have become so numerous in the Kaibab National Forest in Northern Arizona as to threaten starvation of the entire herd because of the sparseness of the natural food. The expense to the applicant will be crating and transportation charges only, a sum estimated to be about thirty-five dollars an animal. Shipments will be confined to east of the Sierra Nevada and Cascade mountains and the deer are to be released in parks, estates or wilderness.

The Methodist people of Elkton, Michigan, have converted an old barroom and tavern into a modern church. The church will seat about three hundred persons.

Nineteen persons more than one hundred years old died in Manila, in the Philippine Islands, during 1923.

When the Normans conquered England and dispossessed the Anglo-Saxons of their lands they spoke Norman-French. The Saxon was the serf who tilled the soil and tended cattle; the Norman was the overlord who ate the meat thus provided. The Saxon called the living animal a cow; the Norman called the dead animal beef. Similarly the sheep was mutton to the Norman, and deer, venison; calf, veal; and the hog, pork.

Many farmers caught with a heavy supply of soft corn this year are making stack silage in instances where their silos are loaded to capacity. One man in Minnesota makes the stack twenty feet in diameter and twenty feet high, keeping the center lower than the outside until the top is reached when the center should be filled to capacity. Butts should be laid to the outside and the stack will then settle evenly and firmly. Top should be covered with hay.

A small mouse got mixed up in the machinery of the Central Electric generating plant of Lille, France, recently, causing a short circuit. The mouse was burned to a cinder, the alternating turbine burst into flames and a large part of the big plant was destroyed, causing $20,000 damage.

Two royal tombs from the Valley of the Kings will be erected in the Field Museum of Natural History at Chicago. Each tomb will contain several rooms and in each burial crypt the genuine mummy of a king and queen will be placed in a sarcophagus.

There are 1,084,128 women engaged in agriculture, forestry and animal husbandry in the United States.

An ancient inn near Paris, associated with picturesque legends and a reputation four centuries old, is to disappear to make room for a modern building. It is the Compas d'Or, 72 Rue Montorgueil, and is now used as a garage for the market carts that bring their loads of vegetables to the neighboring markets.

The United States has an area of 3,026,789 square miles, which, combined with Alaska and her island territories, is slightly larger than the Sahara Desert.

The foot and mouth disease, which has been so prevalent in our southwestern states, is now raging in Belgium. In August, the total number of cattle afflicted was 143,292; a large number of hogs were also stricken.

Imports of the fruit from the United States show that the British people are acquiring a liking for grapefruit.

A movement has been started at Kentville, Nova Scotia, to erect a monument in honor of Longfellow, whose poem, "Evangeline," has that region for a setting.

A new method of warfare has been adopted by the Chinese in their civil war. A trainload of firecrackers has been supplied to the Kiangsu troops for use in assault along the Shanghai battle front. They will be set off by way of camouflage, concealing the real point of attack in the offensive.

A shipment of wool, the first ever clipped in Alaska, arrived in Seattle recently from Kodiak and Umnak Islands.

American Woman in War-Shocked Shanghai

China's Warriors March to the Battle Front Carrying Fans and Bird Cages

By MRS. L. M. CRAMER

Shanghai, September 11—

"Through an accident of fate I have been thrown headfirst into the war area. It is not much of a war yet, but it's going to be a blinger before it's over, so everybody says. I will try to send a story by each mail about it, picking out the things that are unusual, and which I think might interest others. . . . An explosion has occurred that has shaken the house. The big guns can be heard very plainly today, despite the fact that the air is heavy."

OF COURSE, if you have never lived in China I shall expect you to take this article with a pinch of salt, especially that part about soldiers marching to war carrying fans and bird cages, and with paper umbrellas strapped on their backs.

But if any of you who read this have ever lived in China, you will close your eyes and visualize it all—the long line of soldiers marching, toting guns and fanning themselves, some of them carrying bird cages held shoulder high that the birds may "look see."

In our Western minds we fail to connect the Chinese soldier with any such softness of heart. Instead, we think of him, perhaps, as apt to be a cruel chap, pretty much the barbarian when backed into a corner, or crazed with fear, and we are apt to think of him as more or less of a coward. But this soldier of the Middle Kingdom has his more tender side, as evidenced in his love for his bird and his passion for flowers. Every soldier barracks in China rings with the songs of birds, and is bright with its posies.

Again, I know nothing of what the Chinese soldier of the past has been, whether filled with courage or a coward, but so far in the war, which is today in its beginning, he has shown the stuff of which heroes are made more frequently than he has shown cowardice.

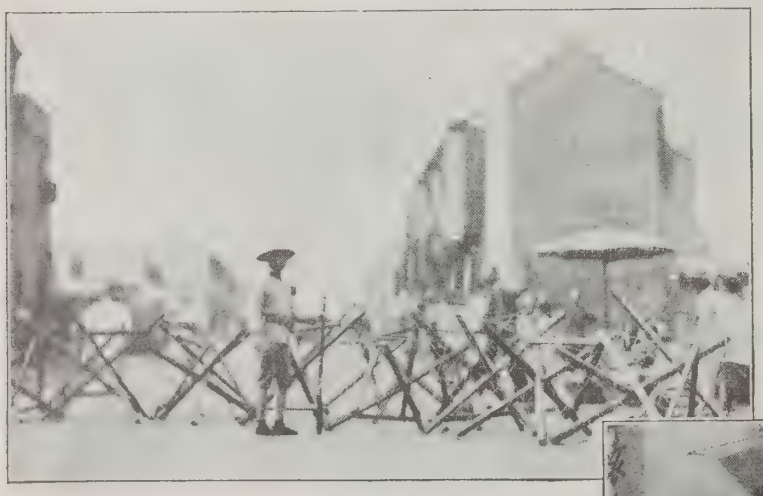
Another reason why we are so willing to underestimate the decency and the possible fineness of the rank and file of the armies of China is that the Chinese themselves look down upon their soldier men. Unlike Christian lands when the men go to war, the soldier in China does not represent the flower of Chinese manhood. He is recruited from the lower walks of life, and it is a well-known fact that China's rank and file has a considerable percentage of bandits.

Peaceful Nanking now war torn.

At the present moment the provinces of Kiangsu and Chekiang are at war with each other and I am one of the tens of thousands of others, both Chinese and foreign, who are refugees in Shanghai, having fled from the fighting or threatened areas to the comparative protection of its shelter.

All last winter we heard rumors of an impending conflict between these two provinces, and as Soochow is in Kiangsu province I used to be rather uneasy about it sometimes. But as the months rolled by and no war came I grew apathetic.

About the middle of August we began to hear soldiers marching past our house. My son and I came to the conclusion that something like 2,000 troops of the garrison about a mile south of us were being moved to another town about ten miles away, and gave no further heed. Even when the No. 1 Boy said, as he was waiting upon my son one night: "Master, my think maybe Chinaman make fight," we laughed at him, and told him not to be afraid, there was going to be no war, and proceeded to dismiss the matter from our minds.



Barbed-wire entanglements and the settlements around Shanghai.

And still the marching soldiers passed our house, bird cages, guns, fans and paper umbrellas strapped on their backs.

The boy said nothing further. Deep down in our hearts, however, a fear was springing up, because we knew that war between Kiangsu and Chekiang would be a terrible thing—because there was Shanghai! Shanghai, which really belongs to Kiangsu province, lies within Kiangsu territorial limits, but because she is so large, she has a governor separate from the governor of the province, and this governor of Shanghai is an appointee of the war lord of Chekiang province and therefore claimed by Chekiang. Where on earth, except in China, could such a state of affairs obtain?

The whole war means no more than a quarrel for the possession of Shanghai, the greatest commercial city in all China if not in the entire Far East, and with Shanghai goes the control of the Kiangnan arsenal—an arsenal that has always been the most important in China. It was a scurvy trick of fate, a mistake on a miserable "scrap of paper," that first enabled Chekiang to own Shanghai. If it is the grand prize in this war between two provinces, it would be equally a grand prize in a greater war, and the conflict between these two provinces may easily plunge all China into civil strife.

Chang Tso-lin, war lord of Manchuria, and We Pei-fu, war lord of Pekin and head of the powerful Chihli party (which is Kiangsu's party) are on the verge of war, and Chang Tso-lin has set September 14, the day after the Mid-Autumn festival, to fire the first shot at Chihli government, which is We Pei-fu controlled rather than by the President of China. Chang Tso-lin, in this declaration has allied himself with the Chekiang forces, which, in the eight days of fighting so far, have seemed to have received the worst of it. Chekiang represents the now nearly extinct Anfu party.

Down in Canton Dr. Sun Yat Sen is this very minute champing at the bit to loosen his forces against Kiangsu, allying himself with Chekiang, and only the accident of fate that finds him financially broke keeps him from entering the fray.

It is an interesting situation, but that, as Kipling would say, is another story and waits a later telling.

Headquarters of the Red Cross in Shanghai.

After we had laughed at No. 1 Boy for his fears he said no more to us about war for a week, and then one night he came to my son, very excited, and said: "Master, Chinaman makee fight tonight at PingWang." PingWang is about sixty li, or twenty good American miles from Soochow, and was close enough to be rather uncomfortable if a battle had occurred there.

But the Chinaman didn't "makee fight" that night, nor the next, nor the next, and when he did, it was at Quinsan, a sizeable city, located between Shanghai and Soochow, on the Nanking-Shanghai railroad, and to this day it is a disputed question as to which side fired the first shot, and by the time the first shot was fired I was a refugee in Shanghai.

After the boy announced that his countryman would "makee fight" that night, we lost considerable of our cocksureness that there was to be no war, but when our men folk suggested that we immediately pack up and go to Shanghai to stay till it blew over we refused.

There were three of us foreign women living in this group of compounds. One was a bride of six months, and one a bride of two years, the latter a dainty little woman from Alabama, the former the British bride of an Italian of noble family.

We three women were six miles from any other foreign women outside the city gates, and, in case of warfare, these city gates would be closed, and then we would be entirely cut off from the missions within the walled city. We were forced to admit that in case Chekiang troops were victorious, and Kiangsu was driven back, the line of retreat would be presumably along the canal which flowed past the three compounds in which we lived. In case of defeat there would be looting and much danger, but we decided very calmly that we should stay right where we were.

One day the British Consul came up from Shanghai, and was very insistent that all foreign women leave immediately. War was but a few hours away, he declared. Then came the night when the Nanking troops started marching past our house, en route to join the Soochow forces stationed at Quinsan. That was a Wednesday night and that night and the next night, till dawn, we could hear cries and screams and shouting from beyond the city wall, a mile away as the crow flies. The Nanking troops, under orders from their war lord, had begun conscripting men in a manner which is far more brutal than that in other countries, and consists of jerking the men out of their homes and often out of their beds, and prodding them along in a line of march at the point of the bayonet. Entirely without orders many of the soldiers started looting the city, the city of their allies! Those nights were hectic nights, and we slept but little.

All the native craft along the canal was being commandeered by the militia, and used to transport ammunition and food supplies to where the Kiangsu troops were encamped. It was also used to transport the conscripted coolies nearer the Chekiang border. Coolies were becoming more and more scarce in Soochow, and those who were left were afraid to venture out of the compounds.

Our coolie, a little fat, bald-headed roly-poly, who looked more like the "Laughing Buddah" than anything human, borrowed all of the tall, slim gateman's uniform he could get into, which was his cap, whenever he had to go outside our compound, hoping the magic word "Socony" on its band would save him from conscription. I had hoped if the soldiers had to conscript anyone from us, it would be the cook, for he is probably one of the worst in all China, but evidently they didn't have to take any of ours. To my dying day I shall see that fat coolie, with the cap of the thin gateman perched on his bald head!

The foreign affairs commissioner of Soochow urged all women to go to Shanghai, where if the worst came they could escape to the foreign gunboats. The little woman from Alabama didn't want to go. The British bride of the Italian nobleman declared she would *not* go, and so did I. And we stayed on.

After a time there were no more marching troops, and no more screams rent the night air, but there were

(Concluded on page 14)

A familiar sight; troops detraining close to firing line.

In the Weird Haunts of the Booze Buyer

Consumption of "Scotch" in Bootlegging Restaurants No Longer the Thing; Offices in Skyscrapers Now Camouflage Activities of Liquor Law Violators

By A. RICHARD DI NATALAE

TO THE many other "seasons" which dedicate or close certain metropolitan activities, be these social or commercial, a new one has been added. It has not attained as yet any sort of chronological regularity, and probably this new "season" exists chiefly in the imagination of those who have an interest in it.

This new season has to do with the liquor market, and affects every angle of this illicit trade. The average citizen, even the one who occasionally takes a nip of some sort of bootlegged fluid, knows nothing about it, but between regular dealers and regular customers the season has an influence, which is duly reflected in prices.

The season, or rather seasons, are measured by either abundance or scarcity. So every once in a while the newspapers announce as a news fact that the abundance of booze in New York is glutting the market, and hint that bootleggers are desperate and about to seek new avenues of income. Then follows a story, much along the same lines, in which the parties are reversed; it is the period of great scarcity, and customers are unable to count on receiving their orders except fractionally, and accordingly prices go up.

These reports alternate with wonderful regularity. Whenever the market is against the consumer, and prices are high, the prohibition enforcement service is credited another inning.

Manufacturing "Scotch"

THE end of September saw an announcement by an influential daily that "12,000 cases of synthetic Scotch whisky is going begging at $5 a case." As normal "boatside prices" off Jones' Inlet, Long Island, is $25 a case ($20 being the "low" and $30 being the "high"), according to the reports of prohibition agents, it is evident that $5 and no takers is about as bad, commercially, as giving it away.

This whisky, and other much like it, is believed to be manufactured chiefly in Long Island, "shipped out to be reshipped to American shores." This shipment consists really in giving this fluid a schooner ride from the point of its origin to somewhere outside the uncharted "one hour's steaming distance" provided for by treaty between the United States and several foreign countries.

Booze buyers are so suspicious now that they don't believe labels any more, nor the salesman's assurance that the stuff in question is actually imported and smuggled in. Especially those "connoisseurs" who pride themselves in getting a case or two of the "real stuff," who needs must hire a motor boat or other seagoing conveyance so that they can see the goods on board with their own eyes. That satisfies them.

Five dollars for a case of liquor, no matter how synthetic, is rock-bottom price, considering that twelve bottles, corks, and packing lumber take up a fair percentage of that price. Even in the good old days around, say, Buffalo Exposition time, when 5 cents would get the biggest schooner of beer and free lunch to boot, and the first cut-rate bars were selling well-known brands at 85 cents a bottle—usually fifths—$5 could not have bought a case of whisky. The bottle selling price represented cost, or topped cost by a very few cents, and the loss was charged to advertising. The same whisky sold over the bar at 15 cents, which brought the profit.

Up in the Office Building

BUT between then and now, there is this difference. The synthetic stuff which according to responsible report is going begging at 41 2/3 cents a bottle retails in the two leading districts of the metropolis at 75 cents a glass, although certain few restaurants charge as high as $1 a drink.

These two districts, supposedly the citadels of the greatest two branches of finance and business, are generally known as the financial and the retail districts. One means, of course, downtown, around Wall or Rector or Nassau street; the other means Fortieth, Forty-second or nearby street, in the heart of the modern store district.

I had always supposed that when one wanted a drink it was necessary to go to one of the many restaurants which do not belong to the cafeteria or one-arm or tea-room types. Broadway was supposed likewise to be the artery of booze, but this is not true. There are undoubtedly places in Broadway that surreptitiously cater to the alcoholic thirsty, but the best bet, according to diners-out, are the more or less obscure, more or less alien, more or less gay restaurants, some of which preach their bohemianism by means of soiled spurious linen, and others which advertise their cuisine by means of makeshift imitation surroundings.

But all that is becoming passé; drinking in bootlegging restaurants is no longer the thing.

Here enter office buildings.

Skyscrapers, some decidedly modern, house or have housed the new type of bootlegger.

One afternoon I was invited to go to lunch with two chaps who felt that their appetite could not be perfect without a little drop. I demurred when I realized that I was being taken out of my way, but my objections were overcome when they pointed to a tall office building in the Forties. An elevator took us up a few floors, thence to a glass door on which were these names:

JOHN BLANK

JOHN BUNK

Agents

We walked in. A young man in shirt sleeves rolled to the elbow carelessly, waistcoat open and dangling in an unkempt manner, and pantaloons much too large and much too long, looked up casually, but with a squint, or what seemed a squint, but as he recognized my two companions his tenseness gave way to serviceability, inquired after the health of one, and meanwhile produced a latchkey from the other end of his watch chain, which happened to have no watch, and opened a side door.

"Right on, gents."

We went in. He remained outside.

This room was barren, except for an ordinary office table and some papers strewn about. My host, since one was doing all the leading, knocked at another door, which presently opened slightly, a face and part of a form appeared at the opening, and exchange of greetings, and into a third room we passed.

Iron-legged tables and chairs, not unlike those of some old drug stores, everywhere. At the far end a mahogany or mahoganized bar, although very short, and nearby cases stacked up, some open, some empty, some partly filled, some untouched. Not a familiar name in the way of liquor; all new names, at least to me, because none had ever come to my attention through street signs, newspaper ads or similar publicity.

In the Brokers' District

MY TWO companions sat down. One drink, two drinks; three drinks. I was hungry, and drink meant nothing to me, but sheer curiosity by this time glued me to my chair, so that between noon and four o'clock I sat there, gazing at my pseudo hosts getting drunker and drunker, judging by the complexity of subjects which they wanted to discuss, and there I left them. I counted seventeen drinks for them—which is enough, assuming that they left the place soon after I had gone. The sum of $25.50, without counting the tips, perhaps the short-changing toward the end, to drink up 34 cents' worth of rank stuff. I say rank because the next day, when I met my remiss host, he was consigning the "bum stuff" to a place deeper than the proverbial brimstone.

"I know good liquor," said he sententiously, "because the next day I never have a headache. And wow! my head today is an oven."

I must not forget to add that sometime during the drinkfest I was duly introduced to a squatty, fat, loudly dressed individual who did not deem a coat essential in view of the wide expanse of barber-pole silk shirting which enshrouded part of his upper anatomy.

"My frien's' frien's," he snickered, "are awlvays velcome. Maybe he vould use a card. I give him one." But he had no card. He tore a piece from an envelope, signed on it "O. K. John," and handed the fragment of paper to me. It was to be my open sesame to this bar, the passport that would open three glass doors to permit me, if I so willed, to exchange good money of the republic for "bum stuff."

That was uptown. Downtown the scene varied.

If one cannot see Trinity Church from the windows of this drink emporium—nothing served in the premises, bottled trade exclusively—it's because one must have cataract or other eye trouble. The name in this place was something like this:

A. JONES

Broker

It is the broker's district, but the sign did not indicate if he, or they, is or are ship and marine brokers, insurance brokers, investment brokers, custom house brokers.

"Comes in Every Day"

A BROKER'S office in any building in this locality is a perfectly plausible, normal and albeit legitimate institution. This place operates (if it is still there, as moves are sometimes very swift) likewise by means of the introduction plan, so that one's friend's friends' friends, chainwise, form the clientele.

"Good stuff?" I asked an acquaintance who described the place where he "got his."

"Genuine Scotch."

"Where do they get it?"

"Comes in every day. If I had a dollar for every case that is landed every twenty-four hours I'd retire tomorrow."

Parenthetically, nothing in the records of the prohibition unit or other dependable source indicates that genuine liquor imported from Europe or Jamaica enters New York, unless an exception is made of the occasional bottle smuggled by a returning traveler or the few cases which equally often can be handled through the complex operations of some tramp steamer and the boatload of accomplices working with some members of the crew. But this quantity, distributed in a New York sense, would amount to less than the available quantity of remaining Napoleon brandy.

But customers do not lack. One, two, and four bottles are the average purchases. The purchasers include men who really amount to something. If the druggist or grocer attempted to sell them something "just as good," as the advertisement goes, even though it is just as good, they would have a million conniption fits, but as long as the broker-bootlegger does it it's all right. And they take this stuff home carefully, enthusiastically, as it is to be the "life of the party."

A place which closed a short time ago masqueraded as a book agent. But the book gag was done to death when the South began to take up prohibition earnestly. In fact, it was Hoke Smith, once governor and senator of Georgia, who years ago used to tell this little anecdote:

Books That Leaked

"AT A little station not far from Atlanta a cotton farmer had suddenly gone in for 'learning.' Every week or ten days he would receive a new consignment of books. The station agent began to talk about it. So did the few station habitués. They gossiped about the intentions of this studious neighbor but time passed and all they knew was that he was getting books all the time, kept much to himself, and paid his freight bills promptly.

"One day, however, the secret was out.

"The expected books arrived and the agent was waiting for the consignee, who failed to arrive. That night he got a whiff of alcohol and mellow rye, and on careful inspection he saw that the whisky was trickling on the floor and a corner of the wooden box soaked by the fluid. So he wrote the usual notice, wording it, however, as follows:

"Please come and get your books because they are leaking."

It is common talk downtown and uptown both that there are dozens of such places in New York, and perhaps there may exist like ones in other cities. Rents are enormously high; overhead is not to be sneezed at. That means that somebody must be buying freely. That being so, and as such places are patronized solely by an office class, to draw a distinction, and not by the laboring class, it sort of clinches the assertion of many prohibition authorities that the bulk of the bootlegging trade is now being maintained by the middle intelligent class, the kind that can risk $5 to $50 each time on the rankest bunko game ever invented.

But that is not all.

The same newspaper which carried the story about the synthetic Scotch finding no purchasers at $5 a case in another section had a story, part of its regular Sunday mercantile gossip, to the effect that credit men are banding together for a new purpose now—that of determining how many accounts at one time a deferred-payment customer is carrying, to learn if the aggregate payments each week or month exceed his net income after living expenses have been deducted. One of the charges is that the automobile is responsible for the skipped payments in most cases today, and that the automobile comes first and so merchants must suffer.

A Monotonous Refrain

BUT if I had had to write such a story, based upon my own knowledge, I should say that liquor at $5 to $12 a bottle is more likely the trouble. It is not an uncommon sight to meet men with badly worn shoes, slovenly cravats, worn cuffs, and other indexes of this kind, speaking airily about buying "a bottle"—and buying it frequently, at fancy prices. Only a few days ago a father of a family was crying his salary was worth a "blessing but two curses" who does not hesitate to buy his booze by the bottle fairly regularly and smack his lips self-praisingly because he can get it for a dollar less than the other fellow, "and real stuff, too."

That "real stuff" song is easily the most monotonous refrain heard in the metropolis. It beats anything the combination of Tin Pan Alley and the vaudeville stage turns out.

I suppose the next joke will have to be something like this:

"What is your bootlegger?"

"Mine is a bookseller; what's yours?"

"Mine is a chemist."

Meanwhile the eternal hunt for the "genuwine prewar wisky" goes on hopelessly.

This Ship Is the Only Six-Master Afloat

Captain York Commands Vessel With $11,000 Cabin; Master Mariner Who Has Sailed the Seven Seas

By MAY B. WHITING

Looking along the deck.

THE only six-master afloat today is the *Edward J. Lawrence* of Portland, Maine; Captain, Joe York. A dozen years ago the "five" and "six-stickers" were the pride of the coastwise trade, but steam, which is quicker and less hazardous and also far less interesting, has driven them from the ocean. The one survivor is scarred and sea-worn, but still sound and staunch, and always picturesque, whether riding the gale or swinging at anchor in some safe harbor, fretting to be off on a long journey. The *Edward J. Lawrence* was built in Bath in 1908 at a cost of $165,000 and no pains were spared to make her seaworthy and beautiful. From stem to stern she measures 340 feet with a jib boom extending 92 feet beyond. Her beam measures 51 feet 6 inches, and her great masts, 30 inches in diameter and 122 feet high, are of Oregon pine, and are surmounted by topmasts measuring 65 feet. With her great sails unfurled, spreading 11,000 square yards of canvas, her five jibs pulling to the breeze, ropes and ladders swaying from the dizzy height of topmasts, the spray breaking and washing along her keel, she is a sight that nothing on the ocean can equal, and, to the true seaman's eyes, nothing in the wide, wide world.

The fittings and equipment of the *Edward J. Lawrence* are such as to insure the comfort of those aboard. Her cabin, which alone cost $11,000, is finished in solid mahogany and walnut. From it leads the captain's room, three spare staterooms, a spacious bath and dining room, all equipped with electric light, steam heat, and hot and cold water. In the bow is the galley or cook room, the forecastle with bunks for the sailors, engineer's room, carpenter shop, and rooms for the officers. It seems a little world in itself, pursuing its own course and lost in its own affairs, with only a few slender threads that draw it once in a while in contact with the big commonplace earth about which the landsman knows.

The last ten or twelve years have taken a heavy toll of large sailing vessels. In 1913 the *Alice M. Lawrence* was wrecked off Nantucket Shoals, and two years later the *Mertie B. Crowley* ran ashore on the same island. Two were lost off the coast of France, the *Addie M. Lawrence* in 1911, and the *Edward B. Winslow* which was burned in 1917. The *George W. Wells* was lost on Cape Hatteras in 1913, and the *Eleanor Percy* sank at sea in 1918. This last winter the *Ruth Merrill* was lost on the L'Hommedieu Shoals and last March the *Wyoming* foundered in a gale in Pollock Rip Channel.

It needs real sailors aboard the schooners, not the "tin horn" variety, as those of the old school designate the steamboat crew. The man who sails on such a vessel must know how to handle ropes, must be a sailmaker, carpenter, blacksmith, and must know how to follow the course that is laid for him. The first and second mates stand watch by the wheel in shifts of four hours each, and, in rough weather, all hands must be on deck continually.

Captain York, of the *Edward J. Lawrence,* has the reputation of being the best-known sailing master on the Atlantic Coast. His forbears on both sides were seafaring folk for generations past. His grandfather was captain of the sailing ship *Roanoake* of the famous Black Ball line doing passenger service between New York and Liverpool, and he himself passed his childhood in the lighthouse at Sequin, one of the most dangerous points on the New England coast. At the age of seventeen he sailed out of Portland, master of a vessel, the youngest captain that ever sailed from America to a foreign port.

His boat was the *Charles J. Willard,* a three-master of 400 tons, considered a large ship for the time, and engaged in the sugar and molasses trade with the West Indies. Those were days when the sailing vessels were like a fleet of yachts. Every morning at five the decks were "holystoned" and every detail kept in shipshape order much as on the battleships of today. Sometimes, off Nantucket Shoals, there would be thirty-five or forty vessels at anchor, waiting for a fair wind, and, when it "breezed up," there would be a race as to who should get to port first.

Captain York holds several records. He sailed from Rosario at the head of the La Plata River in South America to New York in thirty-nine days. In the *George W. Wells* he sailed from Boston to Norfolk, Virginia, in thirty-six hours, beating the steamboat *Ontario,* of the Merchants and Miners line. He has made sixteen round trips a year for three successive years from Baltimore to the Grand Trunk pockets, and has logged 322 miles a day for three days "handrunning"—all record achievements for sailing vessels.

Captain York was master of the *George W. Wells* for eight years, and in that time he was never outsailed. He believes her the fastest schooner ever built, always able "to show her heels to anything that wore canvas."

Under full sail.

He was captain on her last trip in September, 1913, when, bound for Jacksonville, Florida, with light cargo, a hurricane struck her off Cape Hatteras, breaking her rudder, lifting her amidships on a great sea so that the ends broke of their own weight, leaving a gap of ten feet across the deck. With three of her masts broken and booms swinging helpless, she drifted all day and all night. From the shore the life-saving crew were watching, unable to launch their boats in the tremendous surf, and, at dawn, a hopeless wreck, she beached on the shore of Ocacoke Island. From the life-saving station the breeches buoy shot out, and both crew and passengers, including six women and a two-months-old baby, were swung ashore from the masthead.

In 1899, when the schooner *Sarah Ellen* was coming from Mississippi to New York loaded with lumber, she was struck by a hurricane in the Gulf Stream, breaking the rudder, which started beating to and fro, setting all the seams leaking. Before long the ship was water-logged, then broke apart, and Captain York, his brother, and six of the crew drifted for four days, lashed to the top of the afterhouse. Then they were sighted by the British ship *Selma* which came to their rescue.

Once Captain York ran aground in a fog on Richmond Island, just outside Portland Harbor, ripping a hundred feet of keel from his boat. Some of the sailors were for launching the yawl and making for land, but the captain found a way to have his orders to "stand by" obeyed. Without any help he got his boat off the rocks, sailed her into harbor and discharged the load. Then he hired divers to mend her breaks. But they did not do the work to his satisfaction, so he donned a diver's suit himself and worked for three days under water, patching up her holes, then sailed her to Newport News to run her on the drydock to have her thoroughly repaired.

In the Spanish-American War Captain York served in the 14th New York and in the World War he was Lieutenant Commander on the U. S. S. *Franklin,* a steamship of 15,000 tons, carrying troops and supplies for the French Government. His boat was the first one into Germany after the Armistice, carrying flour to the city of Bremen.

During the war the captain had adventures enough with submarines, but no serious mishaps. Once, when in Paris, the side of his hotel was blown off in an air raid, and he, with the other guests, was hustled into the subway. As he passed through the corridor an aged lady thrust something into his hand and begged him keep it safe for her. When in the tunnel and a little out of the crowd, he was able to see what he was carrying, he found it was a parrot! Being a commanding officer, he had the freedom of the city and he wished to go up on the street and see the raid, but he could not find it in his heart to desert the trust reposed in him. So the parrot went along, too, and the Captain returned it in safety to its owner, wondering a little in the meantime if any one mistook him for the shade of Robinson Crusoe or of Long John Silver of "Treasure Island."

Captain York has never been to sea without at least one dog and a cat. The old collie Peggy and her puppy, the cat Tom, seventeen years old and so infirm that the rats will drink milk out of the same saucer with him, and the kitten Buttercup are favored members of the crew of the *Edward J. Lawrence.*

A few years ago, when his boat was tied up for some time in Portland Harbor, Captain York built a cabin on Outer Green Island, a wild spot never before inhabited except by the sea gulls who nest there. Captain York used such vigorous means to protect the birds that the fame of his terrible prowess spread along the waterfront and he was given the nickname "Captain Kidd."

The Captain and his pets.

Wealth of the Woodlands—A Great Inheritance

Tree-Planting as a Factor in the Building Up of a Nation's Prosperity; Scottish Forest That Was Cut Down and Renewed Itself After a Century

By VICTOR MITCHELL

"IF YE'VE naething else tae dae plant a tree; it will grow when ye're sleepin'," says the Laird of Dumbiedykes in Scott's "Heart of Midlothian." If this sage advice were judiciously followed this world would be a much more pleasant and much more beautiful place in which to live. Of course, in planting a tree there is usually something more required than merely digging a hole in the ground and sticking a two or three year old seedling therein. The relation of the young tree to the soil has to be considered, as well as the situation and climatic conditions, and it has to be given a fair chance to take firm root and to become established as a healthy growing thing. A congenial soil and environment will do all that is necessary for the steady growth and proper development of a tree, and under such conditions self-seeded trees grow to vigorous maturity.

The Forest That Grew Again

RATHER more than a hundred years ago, when Great Britain was at war with Napoleon Bonaparte, there grew in Glenmore, the great glen of the Scottish highlands, a forest of Scots pine. Those sturdy trees clung to the rugged mountain side and rendered what otherwise would have been a barren waste beautiful with their stately rows of pillar-like boles, and their dark green crests lifted to the clouds. This forest of Glenmore was on the uncultivated and uncultivatable lands of a certain duke who gave little heed to it except as a hunting ground, until one day a cry went out for timber to build boats and to provide masts and spars for the ships of the British navy. Then the forest was cut down and the duke was consoled for the denuding of his wild lands by the gold which he was able to jingle in his pockets, for in such an emergency the government was willing to pay a fair sum for the material which it so urgently required.

But the duke's forester was a "lang-heided fellow," and he took the precaution to leave a tree here and a tree there so that by these old trees throwing off their seeds in due season other trees might spring up in the barren places, and in the course of time the forest would renew itself by this process of self-seeding. The wisdom and foresight of the forester were fully justified.

Almost exactly a hundred years afterward there broke out the great World War. The supplies of timber which Britain had been drawing from Norway and Sweden, and Russia and Germany, were cut off and she turned to her own timberlands for a close and immediate supply. Among the forests of fine trees, upon which the government cast its eyes at the beginning of the war, was the forest of Glenmore, the mature offspring of that which had been cut down to furnish war material in the time of Napoleon. Row upon row of stately pines once more clothed the mountain side as they had a century before. It was just the sort of timber which was urgently required for the making of ties for the military railroads in France and Belgium, and for the construction of huts for the troops; and so the forest of Glenmore was again commandeered by the government and the duke was given the sum of $180,000, quite a substantial return for a few hundred acres of waste land. The self-seeded trees which brought this large sum in "unearned increment" grew while the early nineteenth-century duke and his successors were sleeping.

Attention to Reforestation

HAD not European countries devoted attention to reforestation in the past many thousands of acres in these countries would be desert land today, and the price of lumber would not only have placed it beyond the reach of the ordinary builder and manufacturer, but would have rendered it unavailable as a material for the making of wood pulp, thus cutting off the supply of newsprint paper. What effect this would have had on the prosperity and progress of a nation can be readily imagined. So fully alive are some countries to the value of timber as a national asset that there is a law which compels the man who cuts down a tree to plant three in its place, the extra number being a precaution against dying off or destruction by pests, and to provide for thinning out.

Great Britain has always taken a pride in her forests and woodlands; there are the oaks of England and the pines and firs of Scotland. In place of the bleak and barren hills which strangers believe were characteristic features in old Caledonia, visitors to the country have been surprised to find the hills and glens beautifully clothed in their feathery garments of green.

To replace the timber tracts laid bare by the axe of the woodman during the late war, many millions of young trees have already been planted, and many more are being raised from seed in the various experimental areas. A forestry department is now looked upon as an essential adjunct of every college of agriculture, and these departments are for the most part affiliated with the nearest university, so that the students of forestry may have the benefit of the superior scientific instruction and equipment which these centers of learning are able to furnish.

Fortunately for Scotland the landed proprietors—who form such an influential class in its political make-up—are, for the most part, like the Laird of Dumbiedykes, fully alive to the importance of judicious tree planting, and in many cases devote as much attention to its scientific pursuit as they would to the breeding of Clydesdale horses or Shorthorn cattle. True, a future generation will reap the benefit of their efforts, but during their lifetime they have the satisfaction of seeing the young firs and pines year by year raising their graceful heads higher and higher, beautifying the landscape for miles, and affording shelter for the wild creatures of fur and feather. Even if they fulfilled no other purpose these young plantations form admirable windbreaks for the farmer's fields and for the shelter of his cattle and sheep, and if the planter is a man of wide and generous outlook, as he frequently is, he can foresee his heirs reaping the result of his labors and—emulating his example—planting more trees for the good of future generations.

Last year there visited this continent a number of forestry delegates from Great Britain, including Lord Lovat, the head of the clan Fraser, and the proprietor of a few thousand acres of land in Inverness-shire. The work which Lord Lovat has done for forestry in Scotland, both before and since the war, is typical of what has been done by other landowners both large and small, as well as by corporations and municipalities.

A North American Pioneer

IT WAS from Inverness that there came William Davidson, the pioneer of the great lumber industry of North America. Davidson came to Miramichi in 1765 and obtained a grant of 100,000 acres. Four years later he contracted to deliver at Fort Howe, in Nova Scotia, masts for the British navy. Masts at this time were worth $680 each, if they could measure a diameter of 3 feet and a length of 108 feet, and Davidson's successful efforts blazed the path for others.

But apart from the cutting down of trees for lumber the clearing of the forests became the task of the early settlers whose object was to bring the land under cultivation and to raise crops of fruit and grain; but unfortunately as the years went on the cutting down of trees became a habit and no one thought of replanting, for the many millions of acres of virgin forest which covered the land seemed inexhaustible. Unfortunately much of the country that was cut over by farmers and lumbermen was quite unsuitable for any other purpose than the growing of trees—just like thousands of acres in the highlands of Scotland—and the settler who was unwary enough to erect his home on such unfertile areas was compelled in course of time to abandon his farm and seek a more productive location. There are quite a number of such abandoned farms in different parts of this continent. These could be restored to their original beauty and usefulness by reforestation, and once more become a great national asset. In addition to its commercial value, such reforestation would mean the restoration to the country of many miles of woodland where the songs of birds would again be heard and mankind would enjoy a heritage which should never have been taken away.

If the vital importance of tree planting is not soon realized by the country at large, and the necessary steps taken to carry it out in a systematic manner, trees will soon become as rare as bears and buffaloes, and, like them, be found only in the most remote regions. A treeless Eden would be no Eden at all but a desert, and one is staggered at the thought of a treeless America. One has only to take a train or motor journey through a few hundred miles of country to realize how the destruction of the woodlands has transformed large areas. Blackened stumps and stagnant pools meet the eye for miles where formerly umbrageous trees enriched the landscape and wild flowers grew in all their loveliness. Where all was fair to the eye there is now ugliness and desolation.

Reclaiming the Wilderness

THERE is a secluded spot near the mouth of a swiftly flowing Scottish river. It was until lately a wilderness of rolling sand dunes whose uniform tint was only relieved by tufts of coarse bent-grass. This miniature Sahara—for it was so until recently—was once a flourishing town which, like Herculaneum and Pompeii, was in one brief night overwhelmed and buried from human sight. But it was not waves of red-hot lava and showers of burning ashes that wrought the devastation, but huge clouds of sand driven by a high wind which blew in from the sea.

To attempt to lay bare this once fair and flourishing spot by the work of excavation was found to be a useless and hopeless task, and modern effort has been directed toward redeeming its ugliness and desolation by the planting of trees. The result of this tree planting, as far as it has gone, has been highly successful. It is serving a twofold purpose; it is not only transforming an arid wilderness into a delightful woodland, but it is binding and knitting the loose soil together with the tough and far-reaching roots of the evergreen conifers, thus forming an effective barrier against future encroachments of the sea or the further drifting of the treacherous sand on the fertile farms farther inland.

Municipal Tree Planting

THIS article does not suggest that lands which have been successfully redeemed from the forest or have been reclaimed from the beds of lakes and rivers and brought under profitable cultivation should be returned to their original state. That would be folly. What is meant is that lands which have been cleared of their timber and have been proved altogether unsuitable for any other purpose but timber growing should be restored to their former usefulness and value by being planted with young trees and that this process of reforestation should be carried out systematically and intelligently from year to year. In this way there would be accumulating every day and every hour a potent source of national wealth in the shape of an inexhaustible timber supply.

One aspect of tree planting which might be followed with advantage is that of reforestation schemes undertaken by municipalities. This has been taken up in some parts of Scotland with much success. A good many years ago the city of Elgin acquired a few acres of woodland on the outskirts of the municipality, the main idea being to provide natural parks for the citizens where walks could be enjoyed through the beautiful haunts of nature. But as time went on it was realized that some of the trees had outlived their usefulness and were suffering from decay. There was then begun a process of thinning out these old trees and filling the vacant places by the method known as under-planting. The young trees were chosen according to the soil and situation, conifers being planted where conifers were bound to flourish, and deciduous trees—such as the oak, the elm, and the beech—being set where such trees were most likely to be a success.

Sheltered by the older trees, and set in their natural environment, these under-planted trees soon showed signs of vigorous growth. All this was done with the co-operation and assistance of the forestry department of the local college of agriculture, the experts of this department being at all times ready to give their advice and supervision. Areas which had been bared of their trees through fire or from some other unlooked-for cause were similarly dealt with, so that now the city has an asset in the shape of healthy plantations which in time will become a considerable source of revenue at very little capital outlay, and a means which will considerably lighten the burden of taxation. The protection of the young trees is looked upon by the citizens as a duty, for they feel that it is to their interest that all these planted areas should flourish and bring their returns in due time. Municipal forestry is a matter that might be taken up with advantage in any part of the world, for by this means much waste land and unsightly areas could not only be made beauty spots, but sources of profit in years to come.

A Valuable Heritage

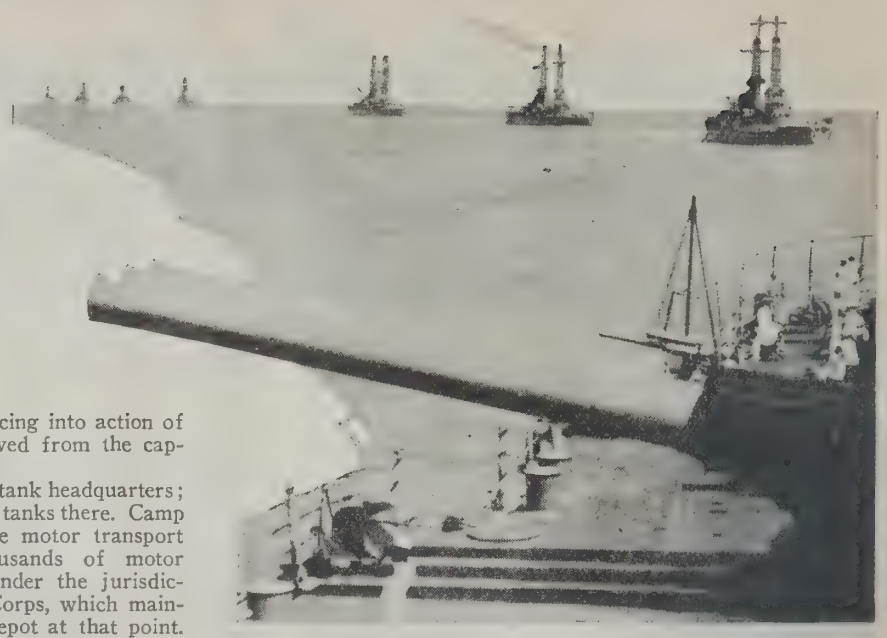
APART from the enormous quantity of timber which is constantly required for building purposes and the making of furniture, there is a steady demand for wood of all kinds for manufacturing purposes, and if it had not been that some men have looked ahead and have secured new sources of timber supply, important industries would have been crippled and retarded.

Mineral wealth in a country is a splendid heritage, but timber wealth is just as important. The two combined are great factors in commercial and industrial prosperity. Wood, iron, and coal form a trinity hard to beat. But supplies of the last two, no matter what their present vastness may be, are not eternal, are not limitless; but the wealth of the woodlands man can keep in his own hands, and by employing the proper means can maintain it until the end of time.

Every farmer ought to have his wood lot for timber purposes in addition to that from which he draws his supplies of fuel, and tend it as carefully and as assiduously as he does his wheat or corn lands. If he does this he will never regret it, for he will have the satisfaction of knowing that when the time comes for his departure to fields far beyond, he will be leaving behind him a valuable heritage, and he himself will have followed the example of One of whom it is written: "And the Lord God brought forth of the ground all manner of trees, fair to behold."

If a Hostile Fleet Came to Washington

By TOM EVERRITT



A section of the Atlantic Fleet in review at entrance of Chesapeake Bay.

A HUNDRED years ago, most of our countrymen were experts with the rifle, and all that was necessary in gathering our forces for common defense of the country was that each one take down his rifle from above his mantlepiece and get on the firing line.

The Second Amendment to the Constitution of the United States, proposed at the first session of the First Congress in 1789, was declared adopted in 1791. It provided:

> "A well-regulated Militia, being necessary to the security of a free state, the right of the people to keep and bear arms, shall not be infringed."

This amendment, having never been amended, and being in full force and effect, means today what it meant in 1791.

The World War proved, however, that no longer can the aroused citizens spring to arms overnight and adequately defend our land.

Take the city of Washington, for example, once burned by the British, once nearly surrounded by the Confederate armies—what provision has been made for its protection?

In case of an attack by a foreign enemy, its aroused citizens would have to go to the nearest armory, or to military posts, or to concentration camps, to secure the needed rifles.

Realizing this, our military experts have laid out elaborate plans for its defense in case of such an attack.

Dismissing for the moment the probabilities of an attack, or of a series of attacks, by foreign enemy aircraft, what of Washington's defenses?

An attack upon Washington, other than by aircraft, would have its beginning, according to the experts, at the mouth of Chesapeake Bay. An invading force would attempt to work its way from that locality, both by water and by land, to such strategic points as would provide avenues for direct attack upon the capital.

Such an invading force would meet with serious obstructions immediately upon beginning an advance toward Washington, for the entrance to Chesapeake Bay is well protected by powerful modern batteries of long-range artillery at Fort Monroe, Fort Storey and Fort Eustis, all in the State of Virginia. On the Maryland side of the Bay, known as the "Eastern Shore," which is a narrow peninsula between the Atlantic Ocean and Chesapeake Bay, the principal protection is a system of railroad artillery; that is, there are no fixed artillery centers; but, on the other hand, the railroad artillery has the outstanding advantage of being adapted quickly to shifting big, long-range guns from one point of attack to another. This railroad artillery system on the "Eastern Shore" is expected to be completed within a comparatively short time.

Presumptively, the enemy advance, proceeding toward its objective, Washington, several actualities of a most stubborn character would contribute to blocking the way. These are Forts Howard and Smallwood; then Forts Humphrey and Myer, in Virginia, and Camp Meade, in Maryland.

Washington Barracks within the District of Columbia, and Fort Washington, a few miles out of Washington, down the Potomac River, would provide a close-up defense of the capital.

All of these army posts would become points of concentration of thousands of soldiers immediately upon the beginning of the enemy advance at Chesapeake Bay.

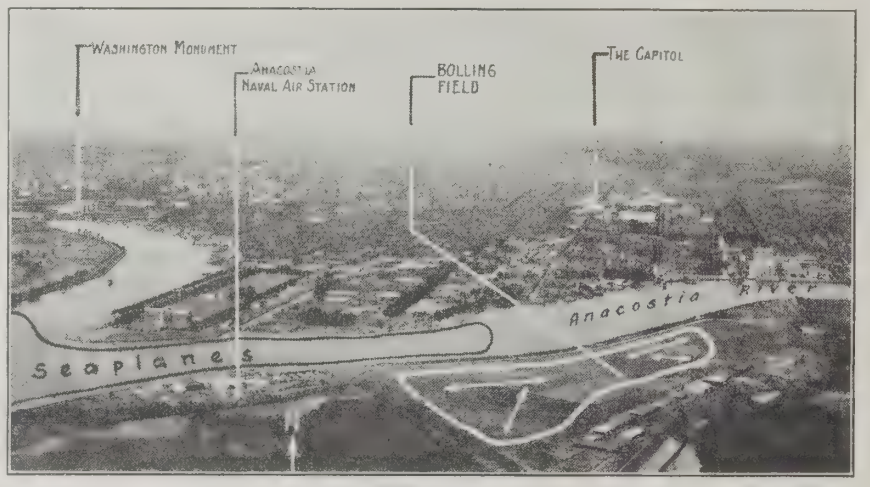
So much for points of concentration of soldiers. Edgewood Arsenal in Virginia, and Frankford Arsenal, at Philadelphia, would supply ample guns, rifles and ammunition, pending the placing into action of other arsenals farther removed from the capital.

Camp Meade is the army tank headquarters; there now being upward of 500 tanks there. Camp Holabird, in Virginia, is the motor transport headquarters; literally thousands of motor transports are now there under the jurisdiction of the Quartermaster Corps, which maintains a big general supply depot at that point. Fort Myer is a combined cavalry and field artillery center.

The security of the Nation's Capital undoubtedly depends, to a very large extent, upon the ability of the air forces of the army.

Bolling Field, within the District of Columbia, will accommodate 1,000 planes. Logan Field, just out of Baltimore, will accommodate a like number.

The Signal Corps of the Army, besides maintaining a very comprehensive system of telephonic and telegraphic wire communication between all army posts, stations and camps, is equipped with a most elaborate and efficient radio system. At the present time, the Signal Corps headquarters in Washington is in daily direct radio communication with Fort Leavenworth, Kansas; Fort McPherson, near Atlanta, Georgia; Fort Bragg, North Carolina, and Fort Hayes, near Columbus, Ohio. Secret code telegraphic message transmitted by concealed wave lengths, are relayed by radio from those points to every army post, station, camp, arsenal and corps area headquarters in the United States. Thus, it would be possible, immediately, secretly to start the needed men and supplies of every character toward Washington.



Bolling Field, Washington, D. C., which will accommodate 1,000 airplanes.

The National Guard of the states adjoining Washington (Pennsylvania, Virginia and Maryland), which would have an important part in its defense, numbers approximately 45,000, and is in a better military condition than ever before in its history.

Hospitalization of war casualties is an outstanding necessity during hostilities. Walter Reed General Hospital, at Washington, which is the largest of its kind in the world, can take care of thousands of casualties. Besides this, there are several lesser hospitals attached to various of the army posts and camps in the territory mentioned. The Medical Corps of the Army is prepared to erect emergency hospitals immediately as needed and located where required.

Having shown the military establishments in and adjacent to Washington, a like showing of the defense organization will be in place.

To meet the demands that would be forced upon it in case of an attack upon the capital by a foreign enemy, the army experts have perfected a theory, or policy, of mobilization that is as complete as can be contemplated in time of peace. The Engineer Corps, the Chemical Warfare Service, the Signal Corps, the Ordnance Department, the Medical Corps, the Air Service, the Quartermaster Corps, the Cavalry, Infantry, and other branches of the service have combined their knowledge, science and experience in a general defense plan, according to which an incredibly short time would be required for mobilization.

The commander of the Washington District, which comprises the District of Columbia only, is prepared immediately to take such steps as would be necessary to guard all the foreign legations and embassies. He knows exactly where all the needful resources of the District are and how to secure them. He knows how much clothing, shoes and hats will be required. He knows where tents, cots and bedding are. He knows where chemicals are. He knows how many knives, forks and spoons will be required and where to obtain them. He knows where ambulances and medicines are. Through the office of the Adjutant General of the Army, he knows where the men are. Through the Medical Corps, he knows where the nurses are. Through the Ordnance Department, he knows where the guns and ammunitions are; and so on all the way through.

In the meantime, the commander of the Third Army Corps Area, with headquarters in Baltimore, is in the same state of preparation. His district embraces the states of Pennsylvania, Maryland and Virginia.

Mobilization of men and material would proceed under a plan of concentration at military posts and training camps. In the District of Columbia, alone, there are said to be 108,000 men between the ages of 18 and 45.

Apparently, comparatively little time, then, would be required to raise a force of soldiers and place them at strategic points, sufficient to repulse an enemy attacking Washington.

But before the army could be called upon for actual fighting, the conjectural foreign enemy would first be compelled to lick the old reliable United States Navy at the entrance to Chesapeake Bay. The Nation's Capital is safe.

In spite of all these preparations, however, it must be borne in mind that the best laid schemes of mice and generals "gang aft agley." In the World War what had been considered an almost impregnable fortress fell before modern artillery, such as those at Liege and Namur, and strategical plans that were made with every attention to detail that foresight could suggest crumbled to pieces before unlooked-for conditions.

It is well to be ready for emergencies, but it is a far, far better thing if such emergencies do not arise.

After all, the best safeguard against attacks by a hostile army or fleet is the cultivation of the good will of other nations. But good will is a plant that sometimes flourishes on one soil and not on the other. It is then as futile as keeping a plot of ground free of noxious weeds while the neighboring plot is allowed to be smothered by them.

Washington looks only to its defense; defiance and disregard of amiable understanding are not to be found in its code of ethics.

Mr. Ford's Page

RARELY is the presidential election determined by the campaign. If it were, the political history of our country would not be what it is. The best campaigners have been oftenest defeated, for the reason that campaigning ability and executive ability are not necessarily the same. The best talkers in our history have proved the most ineffectual doers, and the most lavish makers of promises the least dependable performers thereof.

The choice of a President rarely depends on anything that may occur between the nominations and the elections. It is determined not by the public activity of a campaign period but by the whole tenor of the candidate's life and the constant quality of his service. So that, this being true, it is possible to say that the next President is already selected by the people; it only remains to cast and count the national vote.

There are, however, certain aspects of the present campaign which seem to call for interpretation. The appearance of a so-called Third Party has made clearer the movements of the mass of Independent Voters during recent years of national awakening. There has been no successful "third party" since the origin of the Republican party. It may be inaccurate to speak of the "origin" of the Republican party, as if it were a political organization created for a specific purpose at a specific time, for this party was implicit in the politics of the nation from the beginning of the government. It was not created but evolved. Its germinal idea dates from the first constitutional convention. It was not hastily gathered together to boost an individual's candidacy, as were the Bull Moose party to return Theodore Roosevelt to office and the present misnamed "progressive" party to make Senator La Follette the doorway for alien ideas into the government; the Republican party was the expression of a principle that had ripened for action over a long period and came to fruition more than 65 years ago. It remains the only third party in all that period that has been chosen by the people to administer the government of the United States, though curiously its status has never been that of a third party; it became a major movement from the first.

A third party which had a strong influence on the nation was the prohibition party. Although never intrusted with the administration of government it represented an idea which penetrated the thought of the people and presently became adopted among the principles of the older parties. It represented an educational propaganda through political methods, and naturally, with prohibition adopted, the prohibition party was left without its biggest fighting issue.

The fate of the Bull Moose attempt to float a third party taught us two things: first, that an individual's candidacy is not sufficient basis for a party, however useful and popular that individual may be. This is not due, as many think, to the lack of political organization in such a movement, but to the ingrained desire of our people to vote on principles. That the Bull Moose party was launched solely in the interests of one man was proved by the facility with which that man deserted it when it failed to advance his political fortunes.

The second lesson that movement and its failure taught the country is that there is always a third party in the two older ones. Mr. Bryan discovered that it was not sufficient to be the nominee of the Democratic party; it was necessary also to be representative of the mind of that party. He failed of election because the always available third party, consisting of the Independent Vote in both parties, swung to his various opponents. There is a third party, but it operates as a check and balance *within* the two major parties.

THE last successful "third party" was the Republican party which at once became a major movement. All subsequent third party movements have failed of political success, either because they existed solely to forward an individual's ambitions, or because they were captured by the radical element. Yet a true and available third party has always existed within both the old parties; it consists of the "forward looking minds," sometimes called the Independent Vote, that is not obedient to party bosses, but votes on principle. That true Third Party is operative today, and its leader is Calvin Coolidge. The so-called "progressive movement" headed by La Follette and led by those radical elements which have always destroyed sanely progressive third party movements, does not include the great forward looking independent vote of the nation, and will not be given that vote.

An illustration of this may be found in the experience of Woodrow Wilson. Though a Democrat, the nominee of the then minority party, he was chosen for the presidency. No one pretends to believe that it was the Democratic party vote that elected him; it was the vote of "forward looking men" in all the parties that came to his assistance. The always available third party in both the older parties chose him as its leader.

Since that time numerous attempts have been made to inaugurate a third party movement in presidential elections, all of them meeting with failure. Observers of these attempts have noted that in every instance, since Roosevelt's Bull Moose failure, the third party movement has been captured by the extreme radical element. Whether to prevent Americans from coming together in a sanely progressive political movement, or deliberately to gain respectable patronage for their program, the fact remains the same: they have captured, and by their capture have destroyed, all third party movements up to the time when they were able to induce Senator La Follette to become their presidential candidate. Senator La Follette is therefore not leading the American third party element, but the element which up to this time has succeeded in smothering legitimate third party movements.

The question is pertinent, *Where is the true third party element in the present campaign?* The answer is that *Calvin Coolidge is leading it.*

It was common talk when Mr. Coolidge was governor of Massachusetts that the politicians were against him. The group that controlled political affairs in New England has always looked upon him with suspicion. Politically, Coolidge has always gone "alone, afoot and across lots." As Vice-President his scrupulous regard for the proprieties of his place was interpreted as indicating an inconsequential nature. Everybody remembers what opinion the politicians held of him after he was suddenly thrust into the Presidency. One has only to turn back to the newspapers of comparatively recent date to read the master politicians of his party openly saying that he could not and should not be nominated to succeed himself. He was "colorless," they said.

Then the country was awakened by the plain American courage of this man who, in a series of vetoes which no self-seeker would have dared to make, showed a straightforward type of thought and action which was, to say the least, refreshingly different. He had convictions, he had courage, he took his stand on the broadest basis of the country's good, he led the timid through a difficult period. And whenever he spoke to the people, the overtone of absolute honesty was in all he said.

So it has come about that people of every political persuasion are saying all over the country and with increasing emphasis: "That man is our President." His character has penetrated the national mind. Other candidates stand where they were, or are receding in the public estimate; this man alone is growing. And is it only in the Republican mind that he is growing? No; he grows everywhere in the American mind. All believe in him, radical and conservative. They have a feeling that he is not the creature of any group and therefore not the servant of any.

Thus we have witnessed in this unpromising day a candidate for the Presidency who never had to climb into any political bandwagon. And if the politicians are busy scrambling for places in the Coolidge column it is because they have seen the handwriting on the wall. The candidate whom the wiseacres rejected has become the choice of the country.

It is well worth while to keep in mind these facts about third parties and also to decide who best deserves the name of "progressive"—the Coolidge support, or the Coolidge opposition.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Fourteenth Amendment

MUCH more than the incumbency of the customs collectorship of the port of New Orleans is affected in the application for an injunction to prevent the appointee, a Negro, assuming the duties of that office.

Grounds for the petition allege that the appointee is not a citizen of the United States, and is not eligible to citizenship, because of his African blood.

To sustain the petition, it is alleged that the Fourteenth Amendment to the Constitution of the United States was never lawfully ratified by the required number of states, nor was it legally adopted for submission by Congress.

Oddly enough, among a large number of Supreme Court decisions affecting the amendment, not one has applied to the basic allegations of the petition, according to the counsel for the petitioners, and the question is brought up after the amendment has been operative for half a century.

When the Constitution of the United States was adopted, it was especially approved by popular vote among the colonies, Jefferson and his colleagues insisting that the various assemblies, as the legislatures were then termed, might not represent the popular will on a question not at issue in their election. Curiously enough, the Constitution itself provided for legislative amendment at variance with this principle. Had not this change escaped attention at the time, this suit could never have been started; for by the popular vote at the time the Fourteenth Amendment, the word "white" would not have been stricken from the Constitution in the provision defining eligibility to citizenship.

The United States was a "white man's government," in the strictest sense of the term until the Fourteenth Amendment was proposed, purely as a political measure. Before that time, too, the question of eligibility to the franchise was a function of the state. It remained so after its adoption, until the supplemental amendment providing that no state shall disqualify a citizen on account of "race, color or previous condition of servitude."

The attempt to force Negro suffrage in individual states failed, popular prejudice being sufficient to defeat it at the polls. Democracy was fast overcoming the dominant party, however, and the accession of millions of votes seemed vital. For that reason the Fourteenth Amendment was forced through. Forced, we say it without prejudice, since Michigan, for example, which refused to change its own constitution by a majority unprecedented in those days, was recorded as ratifying it, although the Legislature was elected at practically the same time, and thus reversed the expressed will of its constituents.

The South, under "carpet-bag" rule, obeyed the dictum of Washington, to the number of six states, and this vote is challenged in the petition.

It is hardly to be expected that a decision favorable to the petitioners will be reached by the courts, but if it is, only the legal presumption that acts by a de facto government are valid until de jure rights are decided will save many things that have been done in the last half century.

What Is History?

ONE of the most popular dictionaries defines history as "a narrative of events; a tale; a story." More specifically it says: "A systematic written account of events, especially of those affecting a nation, institution, science, or art, usually connected with a philosophical explanation of their causes."

Now, perhaps there is no class of literature that differs more widely in its treatment as history. In a history book is reflected the mentality of the writer. In it all his prejudices, antipathies, likes and dislikes are disclosed. He cannot hide them, strive as he may. His heroes and heroines, his villains and intriguers are built up from the material most suited to his purpose picked from the scrap heap of past events. He scans the archives of his nation through the spectacles of his own predilections, and rummages in musty charter chests for facts that fit in with his own foibles.

This is not meant to convey the impression that those who collect material for the writing of histories do so with the deliberate intention of suppressing certain facts and distorting others, but merely that a history book is after all only the reflex of the mind of an individual writer or compiler.

It must also be remembered that even historical documents from which material has been drawn are not always reliable. Such records have been known to be forged or "cooked," or to have been carelessly written. The impartial historian must necessarily be not a mere copyist but a sifter of facts.

There is a fine field for the ideal historian—one who will tell the truth and forget his own prejudices. This is the type of history we should like to see our children read. It would be a great book whether it dealt with persons, places, or events.

Preventable Disease

AMERICANS cannot fairly term themselves the most efficient people until they stop the present loss of three billion dollars' worth of human values through preventable disease.

This estimate was made by Sir David C. Bruce, a world renowned parasitologist, in addressing the British Association for the Advancement of Science in Toronto last summer.

Infection, acute or chronic, by bacteria or parasites, is probably the most potent cause of disease, old age and death. Fortunately most of these infections can be dealt with if a physician is consulted in time. However, this doesn't mean waiting for signs of illness. The apparently healthy should occasionally be examined by physicians to detect departures from the normal that the tendency may be checked at once and illness obviated.

The whole thing is merely overcoming the present universal disposition to begrudge the doctor his fee unless he has remedied real illness. Doctors cannot work miracles upon people who have let disease get a real hold; but they can repair the leaks if given the opportunity.

We are now entering the period of the year when the disease and death rate climbs upward simply because most people regard colds, grippe and sore throats as unworthy a doctor's attention.

Several generations hence will practice the sound common sense doctrine of Sir David's, but meanwhile people will shorten their lives merely to save a doctor's bill for early and effective examination.

Health and Efficiency

THE health and happiness of workers in Great Britain received considerable attention at a conference recently held in Oxford. A new outlook on industrial life has arisen in England, but, strange as it may seem, it is the masters rather than the men who have until lately given the movement for the bettering of conditions their whole-hearted support. But we are now told, in regard to the workers, that "common sense has prevailed." In an editorial comment the London *Times* says:

> Those who view with dislike the provision of doctors and nurses, of clean, well-ventilated, well-lit workrooms, of swimming-baths and playing-fields, of social clubs and excellent canteens, are a swiftly dwindling minority.

The *Times* points out that the employers who have put the cleanliness and the comfort of their workers in the forefront of their policy make no pretense that they are philanthropists. The interests of their workpeople, as they point out, are identical with their own interests.

In this connection the leading employers in England have become the staunch supporters of a campaign against the more deadly diseases. In the industrial field research workers are studying the dust problem in relation to tuberculosis, the causes of accidents, and the problem of cancer insofar as it is supposed to be attributable to the occupation of the victim.

This progressive attitude is bound to have an excellent effect on industrial conditions in England. Health and efficiency are inseparable, and this fact is becoming more and more widely recognized.

Development of Barter

WHEN the Constitution of the United States was adopted, evidently, it was not intended the government should create a money system as such. Gold and silver were made jointly the basis of money, but their coinage was to be on private account, the stamp being merely the official certificate of the weight and fineness of the pieces when they left the mint. Such coins were made a legal tender subject to appraisal between the parties to a contract, a "limit of tolerance" being established, below which the money character of a coin ceased and its acceptance as money made optional with the seller. He could claim it at commodity value or refuse it entirely if, through abrasion or wear, it fell short more than a certain measure of weight established as the limit of tolerance. Individual states were forbidden to create a legal tender from any other substance, the implication, since established by interpretation, being to place in Congress the sole power to establish other forms of legal tender.

The ratio of weight between gold and silver was established by law. At times each of the metals was at a discount, owing to the variation in the market value of the metals. This variation had a tendency to correct itself, for the metal undervalued by coinage law ceased its money function here, being hoarded or exported to countries offering a higher price for it. This lowered its value abroad, and increased the value of the cheaper metal here in proportion to the increased demand for money.

Every change made in the coinage ratio had for its object the equalizing of the coinage value of the metals, which had ranged from 15 to 17 ounces of silver to one of gold, or more, with a final settlement at what is known as 26 to 1.

This system obtained at the outbreak of the Civil War, coin money being essentially private property and the amount in circulation depending on the desire of metal owners to change bullion into coin. The only exception was in the matter of the subsidiary coinage which was reduced in metal content to below face value, to keep it in circulation. Thus the silver half dollars, quarter dollars, dimes, half dimes and 3-cent pieces were mere token money issued by government. Paper money, privately issued by banks, and not a legal tender, supplemented the coin money, the principal objection being the variation of discount charged for its acceptance as money. This was a serious objection, although not so serious as is generally supposed, since trade was confined to narrow limits, and banks maintained balances in large cities which honored their currencies and drafts. Stray bank notes from distant cities were accepted by local banks through bank note publications carrying information regarding the discounts, the appearance of counterfeits, and so forth.

The assumption by the government of the monopoly of money issue began during the Civil War with the passage of the National Bank Act, under which a prohibitive tax was levied on bank note and other money in circulation not under government authority. Legislation under this and preceding bills had produced the Treasury note, a full legal tender, the United States Note, or Greenback, of limited legal tender powers, and paper subsidiary currency and various forms of token money, the last privately issued.

The Cause of the Trouble

THE amount of crime and the general disregard for laws, both human and divine, which are at this moment afflicting the world like a pestilence, have caused certain people to pause and exclaim: "What is wrong with our religion?"

There is nothing wrong with any religion that is ethical, is sincerely believed in and sincerely practiced. It is in the neglect of religion that the trouble arises.

Quite recently an eminent ecclesiastic declared from the pulpit that if he happened to be wandering in a Central African jungle and suddenly came upon one of the aborigines engaged in the worship of a stuffed toad, he would take off his hat to him, for here at least were the elements of faith and sincerity. It is the want of these virtues which is at the bottom of the lack of religion today.

How can anything be good if it is neglected and cast aside? How can a judgment be formed upon any theory which is not put into practice? How can nourishment be derived from food that is not eaten and digested?

There is nothing wrong with religion; it is the want of it that causes trouble. Better have some ideal and practice it earnestly than to have no ideal at all.

Good Men Are Wanted Behind the Badge

An Interview With the Man Who Made Himself the Master of Herrin

By MAX BENTLEY

YOUNG man, put on a badge, take up officering. It has always been an honored profession for brave men to follow, and it is doubly so now. There has always been need of a certain number of law enforcers; now the need is urgent. It amounts to a call to patriotic duty.

"The man who cleaned up Herrin" said that. S. Glenn Young gave me a pessimistic picture of the American's attitude toward the law. He says it is a comparatively new thing in his experience to find men so contemptuous of restraint. Drastic enforcement, no matter the cost—not relaxation, not winking—was never needed so badly as now, he says. Everything depends on it.

Since his boyhood Young has been an officer, here, there and everywhere. His twenty-year record is the arrest of two thousand persons accused of crime. He entered that profession because he thought it offered an opportunity to do the most useful, the most appreciated, work a man could do. The bitter experience of the Young family in the trouble at Herrin, Illinois, has served only to confirm his belief that nothing short of a national emergency exists.

When this interview took place Young was lying wounded in a hospital at Belleville, Illinois, the victim of a near-murder party. In the same institution sat his wife with folded hands, her eyes shot out. He has had time to look back on his career and to study it in its relation to the public mind. He finds that to be very bad. He believes lawbreaking is coming to be more and more general because more men and better men do not put on badges.

What are the things that build national character? We have more schools and churches than ever. Travel is speedy, comfortable and cheap. The radio, the newspapers and the magazines have brought about a quick and intense contact of minds. We *ought* to be learning that crime is expensive and destructive and futile besides being just bad. We *ought* to be progressing upward.

"When I arrested my first man, twenty years ago," said Young, "he had respect for me and the authority behind me. Now when I go after a lawbreaker he either laughs at me, or lies in ambush to kill me and everyone who happens to be with me. He thinks I am either a grafter or a fool. Officering has sunk pretty low, my friend."

Who is Glenn Young? His story belongs to that of Herrin—"Bloody Herrin," the press called it after the massacre. That was the episode of June 22, 1922, when twenty-two non-union mine workers and guards were murdered by a mob of former employes of an Illinois coal company and their sympathizers, as a strike aftermath. All the murderers were acquitted, or their cases dismissed, and the effect on Herrin was bad. A lawless element plunged the town into a second reign of terror, that condition continuing until Young came into the picture. He had made a name for himself as a prohibition raider in Eastern Illinois. Facing a decimating civil outbreak between law-abiding and law-scoffing, Herrin, or at least a part of its citizenship, asked him to come in and arbitrarily take charge. He was picked because his specialty was cleaning sinks, because he had that twenty-year record.

"International Newsreel."

The courthouse at Herrin.

"I knew the general thought toward law enforcement was bad, but I did not know how bad it was until I went to Herrin," he said. "There was no law there. It was worse than Dodge City ever was, and three times worse than the lowest-down part of New York City. Some of the best people on earth live in Herrin, and this includes hundreds of men in the mines. The decent people of the town were overwhelmingly in the majority, but the law was not working. They were helpless against a clique of the worst criminals I had ever come across. Heroic medicine was needed, that was clear. I set out to be the doctor, and I cleaned that town, but you see what happened to me."

Yes, he cleaned the town. His exploits as dictator of Herrin were given a positively legendary color in the newspapers. He did the job he was employed to do. It took six months; and, when he finally moved on to other fields, he left a record of raids, arrests and convictions that no other officer has ever equaled.

Then, some weeks later, the newspapers reported the attempted assassination of Young and his wife at a lonely spot near Belleville, Illinois, by four men whom he had had occasion to arrest. Young came through a hail of bullets with only a shattered leg, but his wife received a load of buckshot, fired pointblank, full in the face. Her eyes were shot out.

The wounded officer himself drove his bullet-riddled automobile to Belleville. It was there that I found him, lying helpless on a hospital cot. He was, as he looked to be, a discouraged and very tired man. His big gray eyes marked him inescapably, they were so melancholy. It was easy to read his mind. He was thinking back over a life of strife and wondering why it had brought him to this. While he was being interviewed two ladies entered the room, leading a third.

Young's wife was just a girl, all slenderness and soft curves. She wore a light blue negligee. Finely spun yellow hair was piled high on her head. She should have bounded in with airy greeting, but no, she was languid and quiet. She held the robe about her with one hand as with the other she fumbled for her husband's bed. If Young's big eyes denoted melancholy, his wife's sealed lids spoke plain tragedy. Without eyes to illumine face and movements and words she seemed to be of shadow and not substance as she passed across the room. She seated herself on her husband's bed, not responding to his affectionate greeting. Presently the sound of her little son's voice was heard from down the hall. Then she arose, and was led away.

Young spoke with sudden bitterness.

"There you see a fact picture that speaks for itself. My wife has been robbed of her eyes, and why? Because I was the law at Herrin, and the law was in contempt. If they thought about it at all, her only offense, in the minds of the men who ambushed my car, was that she had married me. All that I myself had done was to arrest them. They concluded to 'get' me by way of revenge; and not only me, but anyone who might be with me. That happened to be my wife, but it might have been you. It might have been anybody."

He remembers the day when an officer was an honored man in the community.

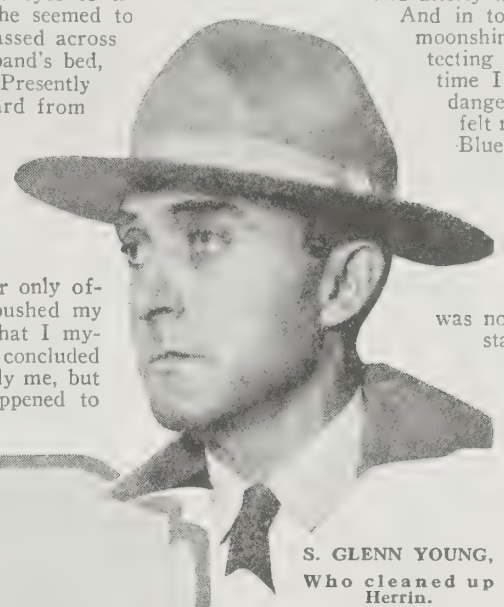
"I was born at Dodge City, Kansas," he said, "and grew up under the traditions of Bill Hickock and Bill Cody (Buffalo Bill), to say nothing of braver men than either of them. It did not take a brave man to be a successful officer: what he needed was character. That was supposed to be a time of lawlessness in the West—you know the stories they tell of Dodge City. Nothing to it. It was pretty gay—harum-scarum, I would say. Anyway, most of Bill Hickock's work as town marshal was with teamsters shooting their pistols in the air, or having harmless fist fights. Murders were few and far between. People might break the law from time to time, but they respected it, and wanted it enforced, even against themselves.

"In my country it was a boy's highest ambition to be an officer. My father saw to my getting through the public school. Then he turned me loose with the advice that I take up officering. I went into East Kentucky, and before I was twenty-one landed a place as deputy marshal.

"It looked like a big job when I was given a blanket and badge and gun and told to go into the mountains of North Carolina and get the bad men. They were murderers, and my job was to deliver them to the circuit judges, alive if possible or dead if necessary. It is true an officer cannot do much palavering with a murderer. Usually, on a hunt for a man that hides in the mountains, the one that lives to tell the story is the one that saw the other first—unless he can talk him out of shooting. That is the point, you could; or rather, I did—many times. I have gone after desperate men, shown my badge and explained my mission, and taken them in without even drawing my gun. The men I have had to kill here and there went down after a fair and square stand-up fight, and no hard feelings on either side.

"I worked the Blue Ridge Mountains for sixteen years. I came to know them like the average man knows his backyard. It was moonshiner country and moonshiner days, and I knew hundreds of those backward people. They might make illicit whisky, but they were men of virtue and honest dealing with their fellow men. They had the highest respect for me and my work. Why, they helped me get my men.

"About 1917 I began to notice a general slackness toward law enforcement. What shocked me was that I found that state of mind in my mountain country. The Department of Justice had sent me there to hunt slackers. That was all that they were wanted for, dodging army service, but I found them generally a desperate lot and utterly without respect for law. And in too many cases my old moonshiner friends were protecting them. For the first time I felt my life to be in danger. For the first time I felt myself a stranger in the Blue Ridge Mountains.



S. GLENN YOUNG, Who cleaned up Herrin.

"In July of 1920 I was transferred to the prohibition enforcement and sent to Illinois. It was simply terrible there. I suppose Illinois was no worse than any other state of large population, but it seemed to me that everybody was breaking the law. Prohibition violations were only a few in the whole sum. In the two years following my transfer I saw more gun work, more murders, than I had seen in the eighteen years preceding. I felt that my life was never safe—and *this* proves it. I am constantly in danger. I could name a hundred men who would kill me tomorrow if they could do it by stealth, but not a single one who would stand up and shoot it out with me. Ten years ago the exactly opposite condition was true."

He spoke of the public conscience as inherently sound but slow and habit-bound.

"Take Herrin," he said. "What happened there might happen anywhere. Without leadership the good people were too confused to move. They were helpless. But when I organized them they were unbeatable. I asked for four weeks' time for under-cover investigation. With only two assistants I secured evidence against 160 resorts—they were that open. Then I organized a citizens' constabulary of 900 and called them together at Carbondale, a nearby town, to be regularly commissioned by a Federal official from Washington sent there for that purpose, at my request.

"We fell on Herrin by night. The raid was a complete surprise. I suppose 5,000 persons in Herrin were in on our plans, but there was not the suspicion of a tip-off. We caught the dives running and that night jailed 120 men. We did not stop there. During the next two weeks we rounded up 500 prisoners. They were so numerous and so unruly that I had to charter a train and take them to Benton, Illinois, under heavy guard for arraignment. We tried most of them; convicted them, too.

"You see, only leadership and determined action were needed. My raiders were all private citizens, men owning their homes. I wanted only true and brave men, and I got them, from all classes, white and brown, Jew and Gentile, Protestant and Catholic, American-born and foreign. What does it matter what a man's religion is, or where he came from, as long as he stands by the law?

"The first big raid ought to have cleaned Herrin, but no, contempt for the law was deeper-seated than that. It was only a beginning. Take the night of last January eighth. I happened to be at Marion, county seat of Williamson County. The telephone rang. I was told to hurry back to Herrin and take a hand: Constable Caesar Cagle, one of my best men, had been killed and a deputy sheriff who was hostile to us had been wounded. I went back at once, and as I drove into the outskirts of Herrin my car was ambushed and shot full of holes. No one hit.

"I found Herrin wildly excited: hundreds of my men on the streets, armed and bent on getting revenge for Cagle's murder. And the other crowd was heeled for a fight, too. I made a speech. I told my people the law must take its course, that there must be no violence from our side.

"The men that we suspected of the murder had retired to a hospital. When I and three others went to the place with warrants for their arrest—when we called on them in the name of the law to surrender—they opened fire. We surrounded the building. The fight lasted all night and at daybreak the National Guard marched in. My chief of police was kidnaped during the night; I took over his job. Then the sheriff disap-

FREDERICK J. KELLY.

Is the College Doing Its Job?

Dr. Kelly of the University of Minnesota Gives Opinion; Intellectual Fearlessness and Moral Courage Is Wanted

By FRANK M. CHASE

"DEMOCRACY, more than any other form of government, requires leadership," says Frederick J. Kelly, "because in a democracy this leadership has to secure its own recognition and make good its claims, often in the face of opposition. Any educational system that tends to leave undeveloped the potential leadership of the people cannot long serve a democracy.

"America boasts a public school system open to every child from kindergarten through the university. This is a proud boast and one for which the country may well make great sacrifices to attain. Educators, however, dare not close their eyes to the problems such a policy raises. Among these is the tendency to set our educational machinery to the pace maintained by the average student. 'Mass education' has come upon American schools so rapidly that suitable adjustments have not yet been made. Nearly all the older countries depend upon a system of education of two types, one for the masses and the other for prospective leaders. One of the most urgent questions before America is how to conserve the essence of the common school and yet provide those of superior ability a chance to develop to their highest possible level."

To the college is intrusted a large share of the development of America's future leadership—a very important job. Is this job being done well? Is the college meeting today's need? Wherein does it fall short?

Perhaps few persons are better qualified to answer these questions than Dr. F. J. Kelly, dean of administration in the University of Minnesota, who has recently completed a critical study of the colleges of arts and sciences in thirteen representative institutions. His study occupied six months, the statements attributed to him being made at its close.

Dr. Kelly is an alert, quick-thinking man, Nebraska-born and a little past forty, who when speaking rains down ideas with the rapidity of machine gun fire. Due largely to his innate humanness, coupled with a broad view and a wide touch with people that he has retained in spite of his years in the classroom, he sees the college's relationships in a big way. He realizes, for example, that the public, the students and alumni have a legitimate interest in the affairs of the college and how they are conducted, as well as the faculty and board of trustees. As a result, in his investigations, besides conferring with the presidents, deans and other members of the faculty, he talked with the students at each college, especially with the student leaders. He also gathered the opinions and experience of many seniors and alumni by the time-honored questionnaire method.

"To judge intelligently as to whether the college is doing its job it is necessary first to know what its job is," he said. "Light is thrown upon this matter by the answers of about seventy-five of the more distinguished alumni of the colleges visited—persons prominent in business, professional and social circles—to this question: Which is the most significant in determining the value of a college course of study: (a) the information acquired; (b) the habits of study acquired; (c) the ideals of character established?

"Of the thirty-one direct answers to this question, only two ranked the information acquired as of the first importance. Only two others ranked it second in importance. Among these college graduates, whose names are widely known over the country, a number were very emphatic in asserting that the information gained is only a means to the end of building an intellectual and moral citizenship.

"As I see them, and I have found considerable agreement in the matter, the college has three fairly distinct functions. These are, first, the preparatory function, providing a mastery of such tools of learning as the mother tongue, foreign languages and mathematics; second, the cultural function, which aims to inculcate such qualities as a social point of view, perspective, initiative, intellectual training and self-mastery, and third, the vocational function."

Turning to the means of accomplishing these aims, it is apparent at once that the effectiveness of any educational institution is chiefly determined by two things—the courses offered and required, and the teachers and methods of teaching. Quite naturally the main emphasis of Dean Kelly's study rested upon these subjects and here, as far as it was feasible, he consulted both alumni and students. The alumni interrogated fell into two groups: first the distinguished graduates to whom reference has been made and, secondly, about twenty-five graduates of each class from 1910 to 1914, inclusive, of each college visited, the time elapsing since their graduation enabling them to present a mature view.

"Leaving out the courses which have been of distinctly practical or vocational value," the alumni were asked, "recall the college course which you prize most highly of all the courses you have studied."

Of the 409 courses mentioned in answer to this question, slightly more than a quarter were English courses with approximately another quarter in history and social science. From this the courses mentioned ranged down, in the order given, through philosophy and psychology, the biological sciences, physical sciences and ancient languages to mathematics, which was mentioned twelve times, and to modern languages nine. Apparently pedagogy to which field Dr. Kelly has devoted himself was not mentioned at all. The replies of 249 seniors ranked the various subjects in the same order, with respect to the number of times they were mentioned, except that mathematics and modern languages were reversed.

"Among students of college age," Dean Kelly commented upon these findings, "subjects which answer primarily as tools do not stand in high esteem. It is fair to question, therefore, whether such subjects should be continued longer among the groups established to secure breadth of training. These tools may be needed, and, if so, they should be required as the need dictates. To class them as cultural and require a certain amount of them as a part of a general education is quite possibly a misdirection of effort.

"The assumption seems to be that the reading knowledge of some foreign language, required in a number of colleges, will result in a common use of the literature found in these languages, and that this will not only broaden the social sympathies of students, but their understanding and culture as well. Such inquiry as there was time to make concerning this assumption would not bear out its truth.

"Almost every conceivable combination of subjects will satisfy the requirement for breadth of training at some college. People may graduate without having had any contact with foreign languages in either high school or college, while in other places both ancient and modern languages are required to the extent of one-fifth the work of both high school and college. Therefore, while group requirements secure acquaintance with several fields of culture, there is no general agreement that particular subjects are essential to culture."

Although breadth of training is now generally secured by group requirements, a movement is under way to require certain common courses of all students. There is a feeling, strongly supported by alumni, that students need a common intellectual world." College teachers, however, do not share this view, the bulk of them favoring requirements from the present departmental offerings.

Above—A student paper. Note the student interests.
Right—An alumni paper.

"The difference in opinion between alumni and college teachers over the value of so called survey courses," says Kelly, "is but an illustration of the fact that college faculties tend to view educational problems from the standpoint of organized bodies of subject matter, rather than from the standpoint of the needs of the students. Probably the severest criticism passed upon college teachers by both senior students and alumni is represented in this. The dominant attitude of teachers of the elementary college courses (supposedly the general cultural courses) is that of laying the foundation for subsequent specialization in the given field. Teachers of general chemistry or general economics, for example, commonly direct their efforts toward those students who are expecting to go on with additional courses in chemistry or economics, even though only a small fraction of the students in these general courses do go on. Some chemistry and some economics are essential as a part of the general culture of all educated people, but that this common requirement shall be met, it is necessary that the chemistry and economics for that purpose shall be taught by teachers who have this general function in mind." This criticism, however, does not apply at the present time to the larger and more progressive institutions.

"Ineffective methods of teaching are due, more than to any other fact, to a failure on the part of teachers to recognize the distinctive aim which the given course should achieve. Preparatory or tool subjects call for one method. Cultural subjects call for another method. Vocational courses call for another method. These differentiations have not been commonly made, and this fact is responsible for much of their difficulty. Teachers of cultural courses especially must be interested in students first, and in their subject matter second. This calls for not only wide cultural training, as distinct from high specialization, but for knowledge of sociology, psychology and pedagogy as well." Columbia and other colleges which give the general culture course to all freshmen attempt now to meet the need of a new method of approach by systematic instruction conference with the instructors who teach this course.

How important are good teachers is strikingly revealed by the replies to one section of the questionnaire submitted to the alumni. The alumni were asked to check which contributed most to the development of a cultured person—the information acquired, habits of study gained, personal friendships enjoyed, inspiration from good teachers, or extra class activities. According to the answers received, inspiration from good teachers stands first, with habits of study gained second, while the information acquired comes last.

Of ten listed characteristics of the "best college teacher," the two standing highest in the minds of the seniors were, in order: first, the emphasis upon life situations in teaching; second, the demand for initiative and independent work on the part of the students. In the case of the alumni these two qualities also stood highest, though their order was reversed.

Blocking the way to better teaching in many colleges is the recent increase in student enrollment, necessitating large classes and a wide dependence upon lectures. Under the lecture system the acquiring of information easily takes precedence over other objectives, with the result that the stimulus of daily participation in classroom work and the influence from contact with inspiring teachers are largely lost. Where steps are being taken to remedy this situation no criticism, of course, can lodge.

"Education," says Dean Kelly, "comes primarily through active thinking on the part of students and unless active thinking can be secured by the lecture method little educational advantage can come from it. At Yale, partly to meet the insistent demand of alumni for better teaching in the freshman year, no section of first-year students is allowed to contain more than twenty and practically all the large institutions are making some such effort to meet the situation. The personal relationship between teacher and student is expected to be stressed. The teacher is expected to become conscious of his students and their needs and to lessen somewhat the value of the materials of instruction as ends in themselves."

In the course of his study Dean Kelly found a few instances in which the essential components of a student's personality are considered as a part of his application for entrance to college. This he regards as a prophetic tendency, even though at present all the qualities of character which society hopes will be developed by college are almost entirely neglected when the teachers evaluate the results of their labors. "If resourcefulness, ability to assume leadership and responsibility," he says; "if intellectual fearlessness and moral courage are the qualities which American citizenship is calling for today, then colleges in their cultural courses are under obligation to give weight to the display of these qualities in their students."

Possibly nothing in the entire realm of college life has drawn more criticism from the general public than the extra-curricular activities. The fact that such activities often make newspaper headlines while the soberer affairs of college do not, has led many into the belief that the tail wags the dog in the colleges. Dean Kelly's findings bear out no such conclusions. On the other hand he sees, as do the overwhelming majority of alumni questioned, much of value in the so-called student activities.

The Art of Seeing Things as They Really Are

And Not as They Appear to the Myopic Minds of Prejudiced People

By F. J. CLIFFORD

"COME away chil'uns, thar ain't no sich anamile." So remarked a tall, lanky Ozarker as he pulled his towheaded offspring away from their awe-struck gaze at the menagerie's giraffe; an incident which tends to illustrate the viewpoint of many readers toward something different—something new—something cleanly—something true.

So constantly have some persons been flooded with muckraking newspapers, salacious books, and the like, that they fail to comprehend the very thing they have been looking for when it is presented to them. It is, therefore, difficult for a writer to get before the reading public something worth while.

To the uninitiated, it seems such a simple thing to do. Just write an article on some interesting subject and mail it somewhere to be published.

It can be written and sent on its way to some publisher all right enough, but after one accumulates a collection of varicolored rejection slips bearing the usual stereotyped "regrets," the budding author begins painfully to absorb an illuminating form of education.

Why is it there is such a lack of worthiness in the mass of books being brought out today? Why is a book old and passé in three months? Is it because the individuality of the writers is being sandbagged out of them by too long contact with our modern educational system?

Something new is a most alluring field, but if one is to delve into its mysteries, one must have more than a modest amount of genius, and, last but not least, a very, very thick hide.

What Do the People Want?

SOMETHING clean sounds good. But do the people want it? Judging from the contents of newspapers and many magazines, they most assuredly do not. Clean books by clean-minded writers are generally slow sellers, but when read they stick in the reader's mind with a something worth while. And, if an author is willing to leave this queer old world with a more or less firm conviction that future generations will appreciate and profit by his posthumous message, all well and good.

A soul-relieving blast of stinging drops of truth might be hurled at a habitually unthinking public. But the public—the major part of it—has not shown a liking for the truth.

There seems to be more demand for facts—publications dealing in authentic information—during the last two or three years. Just what constitutes the underlying reason for it is difficult to determine. It is more than likely a plain reaction; reaction from a truth-suppressing, fact-distorting press; reaction from movies, so obviously rotten and outlandishly unbelievable.

This, coupled with a growing lack of confidence in old-line politicians who most tenaciously hang onto the governmental reins—all this compels Mr. Public Man to put on his thinking cap and demand literature that deals in facts—news on which he can depend.

But if there is one literary road that is treacherous in the extreme, where soul-destroying mistakes can be made, it is that of the iconoclast. Are there not little, harmless weedy places in the minds of the people that shelter bits of tradition, legends, folklore, and so on? Certainly, it would be a mistake to clear away some of them.

Pondering over all this brings to mind an incident that occurred to me in Jackson, Michigan, in conversing with an individual there. He was just an everyday type of man, and having noted my Washington car license he proceeded to bombard me with a motley array of questions.

"Say, them mountain lions out there must be fierce things. I think the government or your state officials should do something to keep them killed off. When I hear of people getting mauled and done up by them, it seems to me that the matter should be dealt with in some way or other so the people would be safe."

"But my dear man," I replied, "they do no harm to people directly. They are—"

"Don't you talk to me that way," he cut in, much as a mother would rush to the rescue of her beleaguered offspring. "I know what I'm talking about, and don't you forget it. My brother was in Montana teaching school and had it not been for his ability as a runner, he'd be dead today. A mountain lion chased him more'n a mile; and he's not the only one either. Many others have told me almost the same thing."

Seeing Not Always Believing

WITH a half indignant, half triumphant air the man glared at me. Though I knew he was wrong, I did not have the heart to try to dispel his fondly cherished notions. They were doing him no harm. The truth of the matter is *people like to believe the things they want to believe.*

The rank and file of us love to surround the object of our admiration with a halo of fond beliefs. The object of our adoration may be a real live baby of our very own, or just a pug-nosed bulldog. It isn't the baby or the bulldog we see, however, it is the fancies with which our imagination has enveloped them.

Shakespeare proved his wonderful genius when in "A Midsummer Night's Dream," he caused the head of Bottom to be turned into that of an ass. Titania, his beloved, and queen of the fairies, devotedly puts her arms around his neck as she proclaims:

"Though he has the head of an ass, I love him." Her aircastles and fancies were built too strongly to be dispelled by such a trifle.

How often have we seen some friend of ours the devoted slave of someone who is the very embodiment of characteristics we thoroughly detest. The infatuated one seems not to be aware of the rasping mannerisms that are so apparent and irritating to us. Would it be wise to open the eyes of the object of our pity? Had he not better toil on till life's day is done and his sacrificial labor is ended?

The divorce courts gain too many recruits from those who have become aware of certain crudities and objectionable characteristics in their mates. After the flames of passion have ceased to dazzle the eyes our idols are sometimes shattered.

If one is to be guided by these musings, the broadcasting of facts must be done with discrimination.

The assembling of facts is no small undertaking, especially if they take a reminiscent form. One old-timer may give his version of some remote incident. The next might say: "There ain't a word of truth in it."

But these old fellows are real historians, especially when their statements are borne out by indisputable evidence. They constitute a real fountainhead of knowledge.

Take the centenarian of Tonasket for instance; he lives a few miles up the twisting, slow-flowing Okanogan. A hundred and seven winters have furrowed his leathery face. Though his physical self has deteriorated, his mind appears as active and retentive as ever, especially of things that happened in the long ago—farther back than the span of two average lives.

To talk with him is like rolling back time a hundred years. Think of a man that was pushing into the West before William Cody (Buffalo Bill) was born, before Buffalo Jones ever dreamed of the heroic stunts he would be put to in saving our bison from extinction.

This centenarian tells of an incident which I suppose the white man's history will never record.

It deals with the conquering of the Indians of this country. This was found so difficult that two or three white renegades went to the pesthouse at old Oregon City and brought back some smallpox-infested blankets and distributed them among the Indians at a big powwow they were having at Rock Island on the Columbia River.

Some Sound Philosophy

THE diabolical scheme proved successful, for the Indians died by the thousand. The Methows were wiped out completely.

Though descendants of the men who perpetuated the outrage are living in the country today, the old man will not give their names. His reasons are that it would not be fair to them; and he is also afraid that his word might be doubted as he is the only living witness.

Another character north of here, with whom I have spent many a pleasant hour, is the philosopher of the Okanogan. He is literally a landmark in the country; a picturesque figure. His once mighty frame is now bent with rheumatism and the weight of fourscore years. Time-worn and gray is he with a long crinkly beard that rests on his bosom. His cheeks show ruddy above it. A huge aquiline nose lends ruggedness to his face. Deep-set dark eyes, gazing from beneath shaggy brows, read one with an intensity that can be felt.

"My dear young friend" (my forty-four years have little meaning with him), he has said to me many times, "judge all mankind by their *generous-mindedness.* It's the best rule I know of. Continually gauge your friends by it till you have taken their measure."

Its true worth did not appear until I had unthinkingly applied it a few times. It is truly surprising the way the wheat can be separated from the chaff by it. Simple and great it is, as the man who propounded it to me.

Many times have I seen him standing in the busy thoroughfare with a steady stream of humanity surging past him. Though bent and old, his broad shoulders and shaggy head could be seen above the passing throng. Leaning on his great staff, his gaze directed far beyond all things about him, he reminded me of some granite boulder around whose base the waters of a river were ever whirling.

Up in the foothills of the snow-capped Cascade Mountains lives an Irishman—the joke-smith of the Methow. Some seventy years old in time and knowledge of earthly things, he is but a mere youth of seventeen in spirits and love of life. Tall and angular of frame, with a drooping mustache adorning a half-mournful face, one would never suspect the deviltry lurking behind.

He has punched burros from Death Valley to the British Columbia mountains, prospecting most of the time, hunting and trapping in between. When not engaged in this line of work one will often find him at a neighbor's where he is always welcomed, especially by the children, for his story-telling ability.

One has to be on his guard because the victims of his practical jokes extend from one end of the Methow valley to the other.

An Unbiased Vision

COULD he be induced to come down to the haunts of city life and talk from the footlights as I have heard him talk from the light of the camp fire—the craggy heights standing apart like waiting ushers, the pine and tamarack whispering around like untrained children—it would mean a fortune to any promoter. But such things cannot be measured in dollars and cents.

The wealth of interesting experiences one can glean from the most unlikely places is truly surprising. How often have I passed by some horny-handed son of toil as, in the field, with bent back, he wrested a sustenance from the barren earth. The sunburnt, wrinkled face, unkempt hair, and frayed clothing might give no indication of the wealth of intellect possessed by the individual, but to engage him in conversation would be like rummaging through some old library of literary treasures.

How often the homeliest flower yields the sweetest perfume, the humblest fruit the finest flavor, and the roughest diamond the greatest luster.

So, likewise many of our citizens who, becoming weary of the countries of the Old World return to their homeland and find in its plains and mountains, rivers, lakes and seashore, a charm and beauty as surprising as it is pleasing.

The same holds good about what we write. Everyday human experiences, when properly portrayed, are full of interest. The vision should be sufficiently clear and unbiased to see things as they actually are though it require copious showers of truth to purify the atmosphere.

Devils Tower National Monument—By J. C. GILBERT

THREE Sioux maidens, while out gathering wild flowers, were beset with three bears. The maidens took refuge upon a large rock which the bears were also able to climb because of their long, sharp claws. The gods, seeing the maidens about to be devoured, caused the rock to grow up out of the ground. As the rock grew the maidens climbed higher, but the bears followed. At last, becoming exhausted, the bears could climb no farther and fell to their death on the jagged rocks below. The maidens then took the flowers they had gathered and made them into a rope with which they safely lowered themselves to the ground.

The rock which grew out of the ground.

Such is the historical legend of the Devils Tower as reported by the Indians and handed down from father to son for many generations. The columnar structure of the rock is supposed to have been caused by the marks of the bears' claws. The Indians also say that during severe thunderstorms the Thunder God takes his mighty drum to the top of the tower where he beats it, thus causing the thunder.

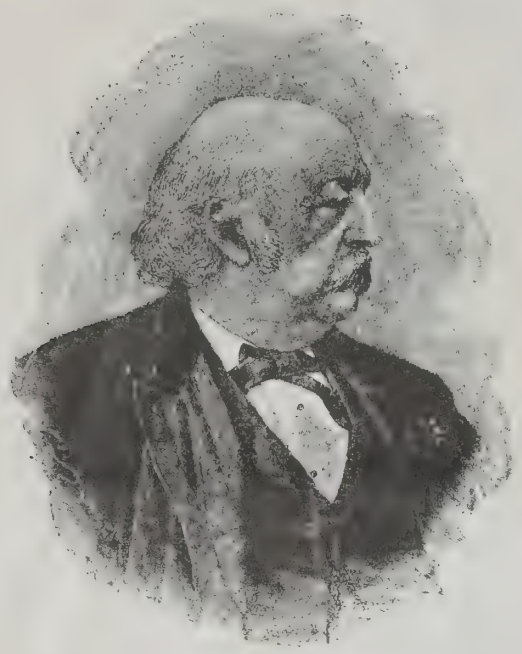
The early white pioneers later on used the tower as a landmark in their exploration of the great Northwest. Still later, the military leaders in the Sioux and Crow Indian country directed their marches by the aid of this ever-present tower, for it is plainly visible in some directions for nearly a hundred miles, and is one of the most conspicuous features in the Black Hills region of Wyoming. The tower proper rises six hundred feet above a rounded ridge of sedimentary rocks, which itself rises six hundred feet above the Bell Fourche River. Its sides are fluted by great columns which stand nearly perpendicular except near the top where they round in and near the base where they flare out. The base emerges into a talus of broken columns lying on a platform of buff sandstone.

The Devils Tower is reached by a side trip of seven miles from the Custer Battlefield Highway, and Black and Yellow Trail, two signed highways, which follow practically the same route through Northeastern Wyoming. Moorcroft, thirty-five miles distant, on the Chicago, Burlington, and Quincy Railroad, is the nearest railroad point.

The Jews Knew When Army Was Winning

General Butler Watched When They Handled Confederate Securities and Acted Accordingly

By MARCUS T. WOODRUFF



Benj. F. Butler

HIDDEN away in the mass of official data compiled by Major General Benjamin Franklin Butler, lawyer, warrior, statesman, financier and manufacturer, is a recitation of his methods of restoring the New Orleans area to normalcy, from the desperate situation in which he found that city when it had been captured by the Federal forces and put under Butler's dictatorship.

"Ben" Butler was an outstanding figure during the Civil War and afterward. Perhaps no other commanding officer was subjected to so much abuse. Yet his work at New Orleans, autocratic from necessity, stands out today as illustrative of some wise policies. He believed in monetary reform. Once the nominee of the old Greenback party for the Presidency, the idea of a government-controlled currency was not new to him. The story of how he restored order and business prosperity in New Orleans after the Federal occupation and through his own ideas financed the tardy payment of Uncle Sam's fighters in both branches of the service is worth recounting today.

When General Butler took command in New Orleans he found the banks, always conservatively managed, in good condition. The banks held plenty of gold and silver, and had used, until a short time previously, their own notes and bills as mediums of exchange. They had refused to use or deal in Confederate currency until forced to do so by the Richmond government, and had begun the retirement of their own notes by substituting the Confederacy's currency issue, but suspending specie payment.

With the beginning of the investment of New Orleans, the banks had made disposition of their coin by putting as much as possible out of reach of friend or foe. Some was exported, some shipped to points within Confederate lines, some hidden in vaults which had been built in the homes of bankers. Some was buried behind church altars or beneath pews. There was hardly a conceivable place where the precious stuff was not hidden, and one of the serious charges against Butler was that he dug up cemeteries in his search for gold.

One of the first general orders from the headquarters of the occupation guaranteed the sacredness of private property, and its protection from seizure by civil or military authority. Early visitors to the commander were bankers, who asked if their specie was to be considered private property under the order.

Confederate Currency

GENERAL BUTLER gave the Negroes, who were employed by the bankers, credit for having informed him of the disposition of the specie, so was prepared for the query. He told them specie owned by the banks and in their vaults would be regarded as private property as long as it was used as money in the ordinary course of business, but that hidden gold and silver would be confiscated. He granted a certain time for its recovery. This resulted in the return of most of the hidden cash, some funds being captured while passing through the Confederate lines. A large amount sent to the Red River country reached New Orleans packed in barrels of beef.

Of course it was inconceivable that Confederate currency should be permitted to remain in circulation, yet its summary demonetization would be a hardship on the poor people of the city, whose only medium of exchange it was. The banks, more heartless, steadily passed out the Confederate script, now badly depreciated, but refused to receive the same notes for deposit. This brought action.

A general order was issued that banks must receive Confederate money at its gold value in exchange for specie, their own bills, or United States currency until a given date, when the use of Confederate currency must cease. This measure was necessary to distribute the inevitable loss and at least prevent its whole weight falling on those least able to bear it. The result was satisfactory, and business immediately resumed a prosperity which not even the North enjoyed at that time.

A disturbing factor later appeared. Communication with Washington was difficult. Papers received were never less than a week old, and the city was in a constant fever over uniform rumors of continuous Confederate victories. Sympathizers with secession became bolder and more virulent. Baton Rouge was the nearest point for reliable information, but could be relied on only for news favorable to the Confederate cause.

In this emergency, General Butler relied upon the Jewish money brokers—by watching them. He shrewdly concluded that if the Jews were buying Confederate bills or exchange, the Federal forces were getting the worst of it. If the Jews were selling then the Confederates were losing. And, as a matter of fact, this barometer never failed him. The day that all the rebel sympathizers were celebrating the capture of the Army of the Potomac, including McClellan, the Jews were selling. Which indicated that they knew the report was false.

To the student of finance, the relation of the manner in which the army and navy at New Orleans were paid without remittances from Washington will be of greatest interest. He says (his references to the "secretary of the treasury" are to himself):

"Meanwhile my troops had been left unpaid, some of them since the time they had left the North. That was not the worst of it: a paymaster had been sent down to pay, but he had not money enough to go around and he did not get his requisitions answered. Therefore the troops, a part being paid and remainder not paid, were, as they might well be, almost in a state of insurrection. More than that, Farragut's fleet had not been paid at all, although if any men on earth deserved their pay it was his crew. Neither officers nor soldiers had had a dollar for the purchase of anything.

Payment by Greenbacks

"THESE new duties of the 'secretary of the treasury' of my imperium must be performed. The admiral called upon me, explaining the destitution of the fleet. He said he could get no answer from the Navy Department to his requisitions, and asked me, in his candid simplicity of character, to write to Washington, thinking I might be more potent with the authorities there than he.

"'My letter upon such a subject would be simply referred to the Secretary of the Navy, so your matter wouldn't go along any faster on that account. How much money do you want, Admiral?'

"He said he needed fifty thousand dollars in gold.

"'Well,' I have six or seven millions of gold subject to my order. It is hard if this necessity of yours cannot be relieved. Tell your purser to draw on me for fifty thousand dollars and you endorse the draft for the payment of your crew, and I will answer the requisition.'

"'But,' said the admiral, 'I can never pay this money, General.'

"'Never you mind that, Admiral; I never expect you will; but it will be a voucher to me when I am called upon to settle my accounts with the Treasury Department that the money has gone for public service.'

"The troops were being paid in greenbacks, and that made a difficulty because there were no greenbacks in New Orleans with which to pay them. The 'secretary of the treasury' of my imperium was puzzled what to do, but at last he devised this financial expedient: The troops who were paid sent home to their families by Adams Express a very considerable part of the sums received, and the oldest troops were paid first, in greenbacks brought by the paymaster when he came. Now, if we could get those greenbacks which were to be sent back by express, we could get enough to pay the remaining troops.

The Cheapest General

"THEREFORE, I made an arrangement with the Adams Express Company that they should return to my paymaster all the greenbacks that the troops gave them to be sent home to New York and Boston, and that they were to answer for the amount as if the greenbacks had been carried there; and I gave them my personal draft for the amount. The arrangement was beneficial to the express company, because if the troops could not get their pay then, they could not send anything home, and the express company could not make its profit. So we kept using those greenbacks in paying, over and over, until all my troops were paid. The drafts were answered, and the express company was reimbursed.

"No other such correspondence was ever had by a commanding general acting as his own secretary of the treasury, showing transactions by which crews of a fleet and soldiers could be paid where they had been left without pay. This condition of affairs was owing in this case to the incompetency or carelessness of the pay department and perhaps in part to the inability of the National Treasury to meet the demands."

There follows in full the official correspondence connected with this transaction, after which the writer closes his narrative with:

"My 'secretary of the treasury' so managed his financial affairs that the very large and extraordinary expenditure for feeding the city and cleaning it and employing the idle men, so they might feed themselves and their families, cost the United States not one dollar! And the Secretary of the Treasury of the United States, when he acknowledged the return of twenty-five thousand dollars in gold which had been sent to my commissary as an advance, said: 'You are the cheapest general we have employed.'"

Something About Platforms and Their Construction

PLATFORM construction is the delicate art of selecting a variety of forceful sentences and so assembling them that they mean nothing.

Once in a generation, some genius arranges a sequence of phrases in such a way that they mean anything you like.

Fastened together with an elastic band, such planks comprise a platform upon which any steady-headed candidate can stand firmly, provided he poses sailor-fashion, with his feet well apart.

The ease and precision with which an expert platform carpenter can knock together a specimen of his handiwork is accounted for by the fact that nothing remotely resembling an idea is necessary to the accomplishment of his task, while consistency, a necessary part of any other form of document, is a superfluity in which few platform committees care to indulge.

For instance, a platform can announce undying allegiance to the sacred principle of states' rights, then heartily endorse national prohibition, national suffrage, national maternity regulation, national game protection, national highway control, national anti-child labor legislation, national forestry, and national anything else which abridges the sacred prerogatives of the commonwealths.

Another platform will descry militarism, then call loudly for more soldiers, more sailors, more marines, battleships, forts and battle planes.

The foregoing observations are not set down as carping criticisms of the platformers; rather it is an expression of admiration for their accomplishments. Any bunch of dubs could plug stolidly along a fixed route; only daring and versatile souls can travel in all four directions at once, without losing their bearings.

So far as the psychological effect of swiping the spotlight is concerned, the platformer has got it and gone. How he does it probably will be explained simultaneously with the clearing up of the mystery enshrouding the incident of Jonah and the whale. He is the only one who knows, and he is not putting out anything in the line of political information.

Recently a woman correspondent of an eastern daily did enjoy a one-sided interview with him, and in her write-up described the presidential countenance as "frank and open."

Immediately she was besieged by a horde of avid representatives of an eager press, each clamoring to borrow her opener.

The present campaign, unique as it is in other ways, will go down into history chiefly remarkable for a startling coincidence which was observed during the pre-convention period.

On the very day and hour when ghouls over in Egypt were preparing to remove the more intimate wrappings from the mummified remnant of what once was King Tut, a man out in Montana suggested W. J. Bryan as a presidential candidate.

After due consideration, they resealed the entrance to King Tut's tomb, keeping the royal remains secure from the prying eyes of a morbid public.

So ran the deadly parallel.

And for all of the strife and rancor and tumult of a presidential year, the only recompense of the voter is that he has had his own way about something.

Within the sacred precincts of the election booth he is not boss-ridden or party-whipped or henpecked, as the case may be, but is free to take a pencil and make marks right where he "dern" pleases.

Sometimes, through inborn perversity, he makes marks where they do not please him at all, and he does it because he knows they displease someone else.

Added to the grisly horror of the election period is the sure knowledge that all of the fuss and worry and turmoil is unnecessary.

Neighbors should not become frigid, friendships fade, and family bonds fray, loosen and be rent apart, because of political differences which could be adjusted with ease if everyone could find time to practice the delicate art of compromise.

Harmony, that's the big word, and, to secure it, let every voter stifle selfish desire, discard prejudice, forget party fealty, frown down sophistry, ignore the blatant sputterings of the district boss—and follow me.

For, if I could have my way, the twenty-five election days would be the most blissful of the century, cheery seasons of unanimity of thought and action.

That is, of course, if I could have my way.

Pictures in Silks and Satins

Forty Years a Milliner Taught Her Tints and Colors; Great Artists Praise Her Wonderful Work

By GEORGE H. DACY

FROM owner and proprietor of a popular millinery store in a small Illinois city to creator of a new and novel system of reproducing marines, landscapes, mountains and clouds in silks, satins, crêpes and chiffons—fabric pictures which are so realistic that you think their small replicas in the frame are the work of Nature—is the great step forward which Miss Orpha V. Ellis latterly has made.

Forty years of active work in a millinery shop—surely a strange preparation for a career in the world of art. Yet for the production of fabric pictures such as Miss Ellis now makes her twoscore years spent in blending colors and in gaining intimate familiarity with the most delicate tints and hues used in the perfection of milady's bonnets have been admirable training.

The life story of Miss Orpha Ellis is one of personal sacrifice. She wanted to learn how to draw and paint in watercolors and oils. She possessed great native talent. All her school-day leisure was spent, pencil in hand, drawing this, that and everything else of life and beauty which she saw around her. That was in the days before drawing in any form was taught in the public schools. There was no kindly philanthropist to guide and foster the artistic skill of the little girl.

Orpha, however, could have made a go of a self-financed education in art if she had no one but herself to look after. There were, however, her mother and sister to be aided and supported. So the courageous little schoolgirl abandoned her ideas of art, tried to forget her inside craving to reproduce Nature's beauties in picture form and went to work in a millinery store at $2 50 a week.

For twenty-nine years, Miss Ellis worked in the hat shop, mastered all the intricacies of the trade and introduced new ideas into the homely business of bonnet construction. She acquired astonishing adeptness in the blending of colors, in the selection of exactly the right shades to form the most attractive combinations—her hats had an air of refinement and style such as many of the best metropolitan milliners never attained in their creations.

For many years, Miss Ellis, her sister and her mother were known as the "Three Little Women" of Princeton, Illinois. Miss Orpha was the business lady of the loving little family. She it was who acted as breadwinner for the trio. And, finally, she came to the crossroads. Further advancement demanded that she go in business for herself. It would be a daring move. What if she failed and Princeton's "Three Little Women" lost their home and the meager savings of many sparse years?

Miss Ellis made a big success of her millinery store. After eleven years of clever financing—borrowing on credit to benefit by the discount allowances for cash made by the wholesalers, keeping every cent of her diminutive "stake" at work constantly, skimping and scraping to make ends meet, Miss Ellis was forced to sell her shop on account of advancing years and declining health. This transaction did not occur until she had made her one great discovery—that beautiful pictures could be made from tiny bits of silk, satin, crêpe and chiffon without the use of either paints or brush.

One day she was asked to produce a travelog for the juvenile missionary society of her home church. Miss Orpha made pictures of Japan, showing the beautiful scenery of that fascinating island, and the setting for a garden party all from silks. The pictures were made in black and white and were of immense interest to the young guests who overwhelmed Miss Orpha with questions about the Nippon.

That experience was the foundation of Miss Ellis' original idea to paint pictures with fabrics. By-products of her millinery store—great piles of bewildering mixtures of crêpes, silks and chiffon—were the pigments which she decided to use in the creation of her curious "fabrigraphs" as she decided to call them. Every shade and color of fabric were used—blues and pale pinks for the sky, gray and brown for the rocks and deep greens for the grass and foliage. Miss Ellis created her pictures, layer by layer, with an artistry and skill gained by forty years of daily labor in blending delicate colors. She used almost invisibly small pins to hold the tiny pieces of fabric in place until the pictures were completed. Then employing a pin point as a brush, she applied paste to each scrap of material—there were hundreds of them in each picture—to hold it in place.

The first picture was a mountain scene. Miss Ellis initially sketched out a rough copy of the picture. Then, piece by piece, she formed the finished picture from piles of discarded scraps and fabrics. The work was laborious, tedious. It took time to select and blend the colors to reproduce the misty, deep, dark green of the pine trees, the wonderful blue tints in the sky, the white-capped peaks of the distant mountains. When the picture was finally completed that indescribable something in her—which was artistic genius—told her immediately that the fabric picture was beautiful.

Immediately, she set to work on another extraordinary picture, this time a marine view showing rocks and sea and clouds—all represented by tiny shreds and bits of silk and chiffon. She devoted ten days or more of tender labor to this marine scene and finally sent it as a gift to a cousin who lived in Chicago. This particular fabric picture was a real painting, a compositional gem of which any artist in oils would have been justly proud.

MISS ORPHA V. ELLIS,

An expert milliner who has perfected a new branch of art—fabric pictures.

Its owner called in a friend, a famous art critic. The artist praised the picture. Standing a dozen feet from it he said: "It is a masterly piece of work. Even though it is not a painted production, it is a wonderful creation with a beautiful blend of colors such as I never before have seen."

Now do not for a minute confuse the remarkable fabric pictures of Miss Orpha Ellis with so-called "ragdoll paintings." Webster defines painting as "the art of conveying thought by the imitation of things through the medium of form or color, light and shadow." The Ellis "fabrics" are all this and much more, for they are the beautiful expressions of a genius who has been overflowing with art for a lifetime and now in the silvery years of old age for the first time is able to give expression to beautiful conceptions.

Collections of Ellis fabric pictures have recently been exhibited at the Whitney Studios, New York City; in the Arts and Crafts exhibits at the Chicago Art Institute; The Anderson Galleries, Chicago; the Arts' Club, Tampa, Florida, and in public expositions at St. Petersburg. Mr. George Innes, Junior, one of America's greatest landscape artists, has made a careful study of the new form of painting which Miss Ellis has originated. He says that Miss Ellis secures better cloud and sky effects by the use of her delicate shades of silks and satins than any master-painter ever will be able to achieve on canvas with brush and oils.

Fabric pictures permit of developing color combinations such as never previously have been displayed in any art gallery. One color of silk can be placed over another to secure unusual effects. Sunrise and sunset tints consisting of hundreds of little pieces of pink, purple, red, blue, yellow, golden and orange colored materials amaze the eyes. Glows from sunset are reflected in the water of certain marines by the use of bits of apricot satin no larger than a pinhead pasted at intervals upon the cloth which forms the waves. Only after studying one of these fabric pictures very carefully can one appreciate that it represents much more trying and laborious work than the production of oils, watercolors or pastels. Selecting, cutting and arranging the tiny pieces of fabric artistically are most tedious. When the picture is finished, you are certain that pigment of some sort has been used. Nevertheless, the production is a paint-less picture of silk and chiffon and satin.

Strange to tell, Miss Ellis and her fabric pictures have breasted the art horizon at exactly the crucial moment. Wood paneling has now become popular and promises to replace the traditional practice of hanging pictures here and there and anywhere about the room. The fabrics dovetail with wonderful precision and adaptation into this new style in art exposition. Although too small to be hung effectively in the ordinary living room, they are outstanding as table pieces and pictorial ornaments.

Among the most popular pictures which Miss Ellis has created are those called "Evening," "Florida," "Afterglow," "Sunset," "Dawn," "The Sentinel," "Winter Glory," "The Jungle," and many others. During the last five winters, this artist has lived in Florida and North Carolina where she has studied sunsets and light conditions and produced a number of justly famous fabric pictures.

To the most of us, it is inspirational that this little lady—a tiny bit of a woman with white hair, blue eyes, a devout disposition and great interest in her unusual art—after having lived a life of bustling business activity is now working as enthusiastically as a recent graduate at a new profession. Her greatest pleasure nowadays is expressing in silk and satin her thoughts and the beautiful sights she sees. Hers is the temperament of the artist released after long repression due to her many responsibilities which included the earning of a livelihood for Princeton's "Three Little Women."

Miss Ellis paints extraordinary pictures using silks and satins as pigments.

Lancashire—Its Cities and Citizens

"WHAT Lancashire does today, England will do tomorrow." So goes the saying, which is pretty hard to contradict successfully, for Lancashire, with its cotton manufactories and its coal and iron fields, forms the industrial backbone of England, and so feels entitled to take the lead in many things.

This country has many large cities of interest, industrially and otherwise, such as Liverpool, Manchester, Preston, Oldham, Bolton and Wigan.

Liverpool, Lancashire's wonderful seaport, has a population of nearly a million and is a fine city, having risen to a first place among the world's ports during the last 200 years—a very rapid growth according to Old Country standards. Its docks are accounted the finest in the world and there are more than forty miles of quays.

Liverpool's shipping, however, has lately been on the decline, most of the great liners of the big steamship companies, carrying passengers and goods to all parts of the world, having deserted her docks for those of Southampton, much to the sorrow and anger of the Liverpudlians. But Liverpool docks dues are very high and Southampton is just as conveniently situated.

Manchester, the center of the cotton trade, has many fine buildings, and more than its share of rain and mud.

Preston is famous for its Guild held every 20 years. The whole city becomes an exhibition ground for that event, and is gay with pageants and amusements of every description along with manufacturing and agricultural exhibits. The famous Derby family, descended from the ancient kings of the Isle of Man, has long been associated with Preston, and Lord Stanley, son of the Earl of Derby, is mayor of the city. The principal family seat in Lancashire is Knowsley, where royalty is often entertained during the Aintree races, when the Grand National is run.

Lancashire's chief seaside resorts are Blackpool and Southport. The former has the finest promenade in the world, with its tower and other places of amusement.

Southport is a veritable garden city with wonderful parks and residences; a truly lovely place with flowers growing everywhere during the spring and summer months.

Here, in this wonderful American city of Detroit, we have magnificent boulevards, parks and residences with their smooth green lawns, but we see very few gardens of flowers.

In Southport every house, that has the least bit of land to boast of, borders it with flowers of endless variety. It is not enough to have a plat of greenest grass; they must have the gay colors of flowers to brighten their homes and lives. The pity is that in the poorer districts of the Lancashire manufacturing towns the people have no means of gratifying their love of flowers, save by window boxes and plant pots; but in this beautiful seaside town of Southport, from spring till autumn, each month sees its own special flowers filling the gardens and parks with perfume and beauty and predominant everywhere are roses of loveliest colors and shapes.

Lancashire has undergone rapid changes of late, like all the rest of the world. It is as merry as any other country in Merrie England and has as brave sons and lovely daughters as anywhere else in the world.

American Woman in War-Shocked Shanghai

Concluded from page 2

still great boats passing along the canal, boats loaded with munitions of war and conscripted coolies, many of whom, frightened and desperate, started the list of casualties before the first shot was fired by jumping into the canal.

All through the day and night one heard and saw wailing women. These were the wives whose husbands had been dragged off.

One night we all took stock of our stores—it was late in August and they were rather depleted. We sent frantic appeals to Shanghai for others, hoping to get enough to last us through a possible long siege; but the boat train they were sent on was commandeered. We managed to get a few things through by mail, but the size and number of these packages were limited. Mail service was threatened with being entirely cut off. Combining the supplies from every storeroom there was only about enough to feed us for two weeks.

Farmers no longer brought food into Soochow, fearing conscription. The two compredores shops, after being looted, closed their doors till the fighting was over. It began to take on a serious aspect, and the fighting, which we had confidently expected would end in a few shots, might drag along for months. Up in Szechuen province a war which started far less auspiciously has dragged on for eleven years now, and it is not ended yet.

But even then we foreign women expected to remain right in Soochow with our men. But we did leave, and when we left we had but half an hour in which to do our packing. The men told us with brutal frankness that food supplies would last much longer with fewer to feed, and that, with us women to look after and worry about, it would be much harder for them, and finally, that if the worst came and they had to make a rush to get out, our being there might so handicap them that they could save neither themselves nor us; that our going then might be the means of saving us all from a hard fate. Then we gave in, for there was no getting away from the fact that, as things looked then, Soochow must expect to see some fighting.

We begged for a day to set our houses in order, and to pack our personal belongings, but another day might see all transportation cut off, the men pointed out. So a foreign boat took us to the station which was an hour's ride from our settlement.

All along the different canals we had to traverse (for Soochow is the Venice of the Far East), we found shops closed and shuttered, and few men were visible. Where ordinarily men in great numbers would be gathered on the bridges, watching the craft ply the waters below, that day only very old men and young boys and coolie women with swollen and reddened eyes stood.

Because it was no time for women to travel alone, my son came to Shanghai with us, and caught the first train back; and it happened to be the last train as well, for the lines were cut within half an hour after his train had left the Henli station.

It was neither pleasant nor safe when we came down for foreign women to travel alone. Our group was the only foreign group in a long train crowded with hot, struggling natives, fleeing to the hoped-for shelter of Shanghai. Armed troops stopped the train between each station, looking for spies or deserters. They were not always kindly in their manner toward their fellow countrymen.

After we left that part of the country where the Kiangsu troops were stationed and got into the territory of the Chekiang troops, it was even less pleasant, for then we were in the enemy's territory and subject to suspicion, but apart from being peered at insolently by the soldiers we were not put to any unnecessary discomfort.

It seemed ages after we had left Soochow before we pulled into the Shanghai north station. In normal times it is a pleasant little ride of two hours through beautiful country.

There had been no opportunity to telegraph ahead for rooms. The militia held the wires for war messages. For ten days natives and foreigners had been pouring into Shanghai. The hotels were crowded, and so were the private boarding houses. We wondered if we would have to walk the streets and sleep in the parks.

I had boarded the previous winter in a house on Avenue Joffre, much frequented by the wives of U. S. Navy officers, whose ships were stationed in China waters, and we went there. The general factotum of the place met us at the door and said, "Missie, I think you come, and I have save one room. It is a little mean room, backside, topside, but it is clean. It is all I have. Maybe one day. two day, some missie go, leave more better room and you can have." And so I took the mean little "backside, topside" room and was grateful.

Looking out of my back window I can see down into a modest Chinese home. You and I would say it was the personification of poverty, but it housed a rich man, his several wives, his sons and their wives, and oodles of small children. The rich man "makee die" the night we arrived. I asked the room boy what disease killed him, and he said, "My thinkee smallpox."

We had left an epidemic of cholera in Soochow. Later, however, we learned that the old man had died of the very unromantic complaint of childhood called whooping cough.

From the windows of a back room we watched the very interesting preparations for the funeral of a well-to-do man in China. The peculiar open-front architecture of a Chinese house made it possible for us to see every move made within the room in which the dead man lay and where the ceremonies were conducted. Because of the war these ceremonies were far less elaborate than they otherwise would have been, but they were strangely thrilling to us—the bright robes of the marching and chanting priests, the measured boom of the muffled drum, the barbaric beat of the tom-toms, tinkling of silver-toned bells and the gooseflesh-raising wail of a peculiar Chinese flute; the weird chant of the priests and the still weirder wailing of the hired mourners—all this, together with the flickering glow of the lighted tapers about the dead body and around the ancestral tablets shining out through the blackest night I ever saw, made us wonder if we were seeing and hearing, or only dreaming.

It was on a Saturday night when we reached Shanghai, and on the following day all communication was cut off between us and Soochow where our men were guarding the interests of the foreign firms they represented.

Actual fighting started the following Wednesday and there is still a dispute (a week and a day afterward) as to which side fired the first shot. Since then ambulance after ambulance has been rushed from the firing lines, past our boarding house, to the several large hospitals which have been taken over by the Chinese Red Cross. It is in these hospitals that the most severely wounded are cared for.

On nights when it is a little quieter in the congested streets, and on days when the wind is right, one can hear the firing from the battle front, for most unexpectedly up to the present time the Kiangsu troops, said to be inferior in numbers and training, are not only holding their own, but are driving the enemy back and back, till the Chekiang troops are now within five miles of the city.

So serious has this situation become to Shanghai and its 8,000 foreigners that every nation with gunboats in Chinese waters has ordered them to steam posthaste to the port, and marine corps from several countries, and the local volunteer corps, composed largely of seasoned veterans of the World War, are all out, protecting the city from the enemy troops, and also from any possible attempt of the Chekiang army to retreat within its borders, while still armed. Barbed-wire entanglements are strung all about the settlement (which is the foreign section) and machine guns, with plenty of ammunition and trained foreign gunners, are stationed in nests all along the barbed-wire entanglements.

The boundaries of the settlement run over a score of miles and every point that can possibly be used as an opening for an invading force is guarded.

But as far as Shanghai itself is concerned, the two most serious problems to be faced are sanitation and food. Shanghai's sanitary conditions are bad enough in normal times, the city has grown so rapidly, and its system is not at all modern. There is the added danger to health, of battle fields a few miles away, where unburied bodies lie in the hot sun, their only covering the buzzing bottle flies.

There is also the matter of food. Shanghai, a world-known port, has perhaps the most wonderful market in the Far East, but it is cut off today from its largest source of supply because of the war. Food prices have advanced from 40 to 75 per cent, and yet there is no profiteering as we understand the word.

Another source of danger to Shanghai is her hordes of Russians, more pathetic figures in peace times than the lowly Chinese coolie. They are starving. Armed burglaries and holdups are increasing and many times Russians are implicated. Some Russians are enlisting, as $50 (Mex.) a month and food looks good to them, and today's newspapers have an interview with a Russian who made a gallant record in the World War. He has hired out with the Chekiang troops as a gunner. If he lives, this war will be a godsend to him—$500 a month, $500 additional if seriously wounded, and $2,000 for his dependents if he is killed. It is interesting to note that he was hired for one month only.

And yet Shanghai, that city of twinkling toes, goes on with its gaiety, unmindful of the battle lines fighting desperately for every inch of ground but five miles away. Mah Jongg parties and bridge parties are held, elaborate tiffins and teas, and dinners at nights, and theaters and balls. The clubs are daily thronged with beautifully gowned women, and life goes on, on the surface, much as usual; yet if the pleasure-seekers stopped their laughter and their chatter, they could hear the booming of big guns, and the rat, tat, tat of the bullets, if the wind is right.

But why not? This is war in China where everyone knows that it may all end suddenly tomorrow. Then again, it may last for eleven years. Remember Szechuen!

But one thing has broken all precedents. According to the old-time foreigner here, the Chinese soldier will not fight in the rain—but he has. His advance and his retreat may have been slowed up, for the rice paddies are ankle deep in mud, and mud in China is like glue. It has rained every day of the eight since the first battle was fought. Sometimes it has been a regular downpour, sometimes a mist, and all degrees in between have had their turn, but through it all the Chinaman has fought. Damp powder has played havoc with his big guns, but he has stood in the open and done his best, and he hasn't even raised his funny little paper umbrella that he toted, strapped to his back, all the long hard miles of march battleward.

To go back twelve days to the day we took the train at Soochow for Shanghai, just as the train pulled out the little Alabama bride, with a catch in her voice and a heightened color in her cheeks, said: "I never thought I'd spend my wedding anniversary running away from my husband," and her John, smiling bravely and waving his hand at the departing train, was cheated out of his holiday.

The two had planned to spend that day—their second wedding anniversary—at some of the delightful summer resorts, and when war made that undesirable they had planned to spend the day visiting some of the many interesting temples in Soochow; but instead there was John standing on the station platform, looking after a departing train, and Mrs. John making a brave effort not to show that she devoutly wished she had never come to China.

New Forest Legislation in Sweden—By BROCK MAIN

IN VIEW of the growing interest now being manifested in all parts of the United States in forestry problems, the new Swedish forestry law presents some outstanding features. This new constructive legislation reads in part as follows:

"Except in certain provinces set aside for public domain or conservation purposes all woodland fit for the growing of timber only, is to be used for forestry purposes. The supervision of the law is administered in each county district, where the law is applied, by the Forestry Board there. Young forests may not be felled in any other manner than through thinning appropriate for the development of the forest. The felling of old forests is to be carried on in such a manner as will not imperil the regrowth of the new forest. If after felling the remaining forest is not sufficiently thick or of such a quality that it, in consideration of the existing climatic conditions, cannot be considered satisfactory and a natural regrowth cannot be expected within reasonable time, measures will be taken to insure a satisfactory reproduction within reasonable time on the area. A forest thus reared must be maintained until it has developed so far that it no longer need be considered a plant-forest. Where the forestry board finds it necessary that certain trees be kept as seed-trees or that, to protect regrowth, felling for domestic purposes within a certain district for some time hence may not take place, in which cases the seed-trees are to be marked plainly and such districts marked out plainly, and felling of the seed-trees within the district is not to take place before the forestry board has granted permission to do so. When permission to fell is granted, marking must as a rule be done by the county forester or some other person authorized by the forestry board, and the stamp of the forestry board be affixed to the marked trees by the executor both at the root and on the trunk at shoulder height. All slash is to be disposed of, the limbs and tops piled and burned in a space provided for this purpose and at a time designated."

There is much more to the text of the law but enough is here given to convince a person familiar with the conditions in our country that had we a law such as this in effect in America fifty years ago we would not today be in the grip of a timber famine. The builder of today would be paying but a small fraction of the amount he does pay for his lumber and would be assured of a good high-grade product. We had no such law, nor do we have such a law at this time. The lumberman—except in a few isolated instances—cuts all his merchantable trees at once, lops the limbs and tops and takes the logs. No attempt is made to dispose of the slash which, drying out, is a year later transformed by a spark into a mass of flames burning everything in its path, destroying the young trees, the seed-trees, and making sterile the topsoil that has been forming throughout the centuries. A desert is the result and we have millions of acres of such land throughout the lake states, certain sections of the East and South and are acquiring many millions of acres more in the fast depleting forests of the Pacific Coast states and the Inland Empire. If we do not soon have a forest law similar to that of the new Swedish law, and with a suitable clause to take care of the tax burden on cutover land, our forest land will revert to desert. We do not want to see our forest land resemble the barrens of China, where the inhabitants pick up the scrub brush for wood, not waiting for the tree to become even large enough for lath or box lumber. We must legislate before it is too late.

Men Are Wanted Behind the Badge

Concluded from page 9

peared, and I took over his job, too. Why, we had a terrible time before those men would submit to arrest.

"Respect for law? Man, every time I arrested somebody one of his friends arrested me. I am under bonds right now amounting to $400,000—indicted for every offense on the books, from kidnaping a sheriff to stealing a rosary. Why? Because I had an old-fashioned idea that the law ought to be enforced, and that wasn't popular just then. Of course, none of those cases will come to trial, a bad sign of the times."

I asked Young if he thought the prohibition laws were responsible, and, if so, should they be repealed or made easier?

"Nothing to it." The answer was prompt. "Long before we had prohibition I was noticing the low attitude people were assuming toward law, all law. Kansas was dry when I was a boy, and had no capital punishment. Everybody knows about Kansas' fine record.

"Prohibition laws are trifled with in a country that is dry by instinct. Why? There are two reasons, and the second springs from the first. Ninety per cent of the field jobs are political: too many of the outside men are petty grafters and cowards, and picked not for fitness but for the votes they can drum up. The place to enforce any law is right where it is being broken.

"You can't do it in Washington with clerks writing reports. Men won't take that sort of thing seriously. It arouses contempt and a disposition on the part of men whom you would call honest to shield lawbreakers. Prohibition ought to be enforced to the letter, regardless of cost. Dry up the country and you will dry up crime. Keep liquor away from the present generation, and the next generation won't know the taste of it. That's old stuff, but it's true.

"But the big thing is to enforce all law. You can't do it unless you bring back old-time respect for the man behind the badge. You can't do that unless he is entitled to respect. Men with guts"—the word blazed from his lips—"are needed now as never before."

Painting the Lily and Adorning the Rose

Charles Ayer Whipple Renews the Mural Decorations at the Capitol

By S. R. WINTERS

IF YOU are among the thousands who daily stroll through the Senate wing of the Capitol your attention cannot fail to be arrested by the decorative objects on the walls of the first floor. The birds, fruits and flowers of the American continent have been sketched on these walls, representing at once a study in natural history and specimens of probably the finest paintings in the world.

The preservation of these artistic mural sketches, however, was threatened for many years. About five years ago Charles Ayer Whipple, a master artist, undertook the restoration of these paintings. They had been placed on the walls before the Civil War, when the wings of the Capitol were built, and, aside from spasmodic feeble attempts, nothing had been done to restore their original beauty within a period of sixty years or more.

The aging influences upon these decorations had partially wrecked this creation of art. The plaster upon which the famous Italian artist, Brumidi, had left his impress more than half a century before was cracking, and in places had peeled off. The truth is, these paintings were in such a dilapidated condition that many persons believed the decorations beyond recovery. Other interested parties, however, entertained the notion of effacing the paintings entirely. Guides at the Capitol, realizing the bad condition into which the paintings had fallen, were inclined to direct the attention of visitors to other objects.

This description applies to the condition five years ago. Today the thousands of sight-seers who daily stroll through the Capitol are attracted by the artistic representations of birds, flowers and fruits that ornament the walls of the wings of the Senate. The likeness of a red-headed woodpecker or the priest-like appearance of the cardinal or the simplicity of the bluebird—either or all may engage the attention of lovers of bird life. If flowers are pleasing to you, roses and poppies are sketched here and there on the walls, to make no mention of other varieties of the floral kingdom. Then, too, apples, oranges, grapes, pears, and even cantaloupes and watermelons are represented among these figured sketches.

The handiwork which has made possible the restoration of these paintings, comparable to those in the palace of Rome, may possibly be seen with the artist's brush in action. If not, inquire for the studio of Charles Ayer Whipple. The guard will point to a corner somewhat removed from the corridors. Here, hemmed in by a tent-like screen, may be found Mr. Whipple mixing paints or probably studying a book on bird life so that he can faithfully paint the characteristics of different birds. The entrance to his studio carries the warning, "Keep Out." This injunction should be heeded, since the space reserved for his paints, brushes, one chair, and a desk is so restricted that only one person can turn around in it at a time.

The restoration of these mural paintings, which have been acclaimed by many as the most beautiful in the world, is the work of an American and not that of an Italian artist. Or, to quote the expressive phrase of Mr. Whipple, when Congress decided to salvage these decorations, "a Yankee from Massachusetts was drafted instead of importing an artist from Italy." He has been laboring on this task for six hours a day for five years, and with the lapse of a few months more the painstaking job of recovering the walls to their original beauty will have been completed. The retouching effects have, in the main, followed the decorative scheme outlined and executed by the master artist Brumidi. This Italian, who labored continuously for twenty-seven years on the decorations of the Capitol, was stricken with a fatal illness before he completed the work. Mr. Whipple, in his recent restoration of these paintings, has supplied two vacant spaces with water sketches of Great Falls, the Niagara of the Potomac River. He made these studies on Sundays and faithfully conveyed the features of these water rapids to the walls of the Senate wing of the national lawmaking edifice.

Mr. Whipple at work with brush and palette on one of the mural panels.

"I have taken great pains with these decorations," Mr. Whipple told the writer. "I reasoned that the walls of the Capitol should be just as near perfect as possible, regardless of the little extra time that it might require. The small cherubs or cupids on the walls have been the most difficult things to restore. These require a knowledge of the human figure, which I have studied for forty years. It was once contemplated to employ house painters in restoring this work of art, but the employment of persons without knowledge of human figures and other fine details of decorative sketches would have resulted in failure of the project.

"I have used the finest colors known in restoring this piece of art. Contrary to the opinion of many persons, plaster on walls is an enduring form on which to make paintings. In fact, decorations can be more perfectly sketched on plastering than on any other materials. If, on the other hand, paintings are placed on canvas fine cracks will develop and it is not possible to remove these cracks from observation. If a large hole appears in the plaster, the disintegrating portion may be taken out and fresh plastering used for restoring the painting, without leaving a flaw. For this reason I have been enabled to restore these old paintings to their original beauty."

Charles Ayer Whipple was born in Southboro, Massachusetts, 65 years ago. He was graduated from a grammar school, after which he obtained employment in a book and job printing office in South Framingham. Here he learned the trade of a printer. Meanwhile, at the age of 19 years, he developed an aptitude for drawing, which led to the engraving art; this he cultivated while working in a music-publishing establishment in Boston. In 1877, he attended the Normal Art School in Boston, and two years later pursued a course at the Museum of Fine Arts.

In 1889, Mr. Whipple went to Paris as a student at the Julien Academy, studying under Bouguereau and Ferrier. After a brief stay of six months he visited Boston where he married, and with his bride returned to France for a resumption of his art studies. He lived in the artists' colony and earned a livelihood for himself and wife by doing some copying in the Louvre.

"Copying famous pictures is a part of the training of an artist, but students should not pursue this line to any great extent, as it is ruinous," warns Mr. Whipple. "It destroys the initiative or whatever individuality one may have. I limited myself to three great pictures, all of which I disposed of in this country at a fair price."

Upon the completion of his art studies under three master teachers in France, Mr. Whipple located in New York City. For a period of twenty-six years, he specialized in the painting of life-size pictures of distinguished personages. Among the noted individuals sketched by his brush are Presidents William McKinley and Theodore Roosevelt, Joseph G. Cannon, Champ Clark, John Sherman, former Governor Oliver Ames, of Massachusetts, and Caleb Chase. Recently, he began the sketching of a life-size portrait of Senator Robert M. La Follette, of Wisconsin.

"My first experience in Washington was ten years ago, when I came here to paint the portraits of Joe Cannon and Champ Clark," said Mr. Whipple. "In my work here I made the acquaintance of Senator John Sharp Williams. He was then chairman of the Library Committee."

While engaged in sketching the portrait of Joseph Cannon, this artist was retained to restore the mural decorations in the Senate wing of the Capitol. An appropriation of $5,000 a year was made for this purpose. He is completing a masterful effort in recovering the primitive brilliancy of these paintings, and he believes they should endure for a century.

Mural decoration is one of the most ancient forms of art, and the excavations among the ruins of Pompeii have uncovered some of the beautiful wall paintings of the palmy days of ancient Rome. The favorite subjects of these ancient decorators were birds, flowers, and the human figure. It is more than likely that the Italian artist Brumidi has seen these, and found ideas for his work in the Capitol.

The restoration of the mural paintings in the Capitol by Mr. Whipple, and the success which has attended his efforts, will doubtless encourage other work of the kind in public buildings in various parts of the country. Mr. Whipple has imbibed the spirit of the original designer.

Stories From the Woodland Trail—

WILD DUCKS

UNTIL about the time of the Civil War, North America was a veritable paradise for water fowl. Of wild ducks alone we have about twenty native species, while Europe has only about half a dozen.

There are no data on which to base an accurate estimate of the number of individual birds still existing, but from returns made by Minnesota hunters, I estimate the number at somewhere around 60,000,000.

Taking the continent as a whole, I do not believe that we have now more than one-tenth of the original number, which would mean that originally the continent was the home of 600,000,000. This vast host, if they could have been placed in line, would reach thirty times across the continent from New York to San Francisco.

The main cause for the greatly reduced number is to be found in the settlement of the country, which has destroyed a large part of their breeding ground. The second cause is persistent annual hunting and the large bags still allowed by nearly all states.

Half a dozen birds a day ought to be the universal limit, and we shall have to come to that before long; or we shall not be able to get even that many. Even in the early nineties I have seen hunters come to camp with 150 ducks, all killed in one day. I doubt that even the best hunters could now kill that number anywhere in this state.

As everybody knows ducks are water birds, but practically all of them nest on dry land near lakes and sloughs, and the wood-duck even nests in hollow trees.

The river ducks dive for much of their food in shallow water, but the so-called sea ducks will dive to a depth of more than a hundred feet. All ducks are migratory. The blue teals leave the northern states in September, while the mallards do not leave till lakes and marshes freeze over, and a few of them may be found near spring holes all winter.

The shelldrakes or American mergansers are still more attached to their northern home. Some of them remain wherever the streams are open. Last winter I met, on the Mississippi near St. Paul, with a small flock of them in February after the worst storm and cold weather of the season. The birds were enjoying themselves on a narrow stretch of rapid open water, when almost everywhere the ice was thick enough to support a team.

It is strange that birds who depend for their safety so largely on their wing power should ever be bereft of the power of flight. Such is, nevertheless, the case. For about two weeks in August wild ducks cannot fly; because all the members of the duck and goose family in the process of moulting lose all their large wing feathers at the same time, which is not the case with our common field and woodland birds.

But if anyone thinks that this would be a good time to catch a boatful of them alive, he would be disappointed.

I once pursued in a rowboat a flock of about eight hundred flightless redheads. They acted the part of very noisy and much-scared flappers, using their wings to increase their speed in swimming, but they kept well out of my way; and if I came a little too close they disappeared in the rushes, where I could not follow them.

BRIEFLY TOLD

Cement was invented by a humble bricklayer of Leeds, England, 100 years ago.

The city of Bucaramanga, Colombia, the center of a population of about two millions, has neither a railroad to the plateau nor an outlet to the Magdalena River, less than fifty miles away.

The co-operative movement was first introduced in 1844 by flannel weavers in Rochdale, England. It was intended to provide a means of relief from existing unemployment and high prices.

The statistical department of the city of Tokio has just published a final report of the losses and damages caused by the earthquake and fire in Japan: Tokio, $1,900,000,000; Yokohama, $590,000,000; other areas, $250,000,000. This does not include the losses of art treasures and personal property. It is believed that if they were included the losses would total $5.000,000,000.

A record cable speed has been set by the new Western Union line which has been laid between New York and the Azores. Present cables provide a speed of 250 letters a minute, while the new record is 1,700 letters a minute.

The census of manufactures, announced by the Census Bureau, shows that the value of aircraft products has almost doubled from 1921 to 1923. The industry turned out $12,945,263 worth of products last year, an increase of 94.4 per cent over 1921. Airplanes numbered 505 and seaplanes 82.

Within eight years, 3,500 miles of railroads in the United States have been abandoned.

Tennessee leads the states in the growing of oak.

The water is so clear in the fjords of Norway that very small objects can be seen clearly at a depth of 150 feet.

It has been discovered that owls have two pairs of eyelids. During the daytime one set is lowered over the eyes, but even with its vision thus obscured it can see farther than a human being. This upsets the theory that the owl is blind in the daytime.

Defense Day, which was observed by this country on September 12, is not a new idea but is of ancient origin. According to tradition, the mustering of a country's fighting strength, annually, goes back to the time of Alfred the Great, and it came to this country with the early colonists. In the Revolutionary days it was called "Muster Day" and until 1840 it was a gala day, especially in New England and the South.

In European countries there are 1,800 daily and weekly newspapers published. Berlin with 100 papers, half of which are dailies, leads the list. Vienna, which is second, has 55, including 22 dailies.

It has been recently discovered that the waters of the Dead Sea contain a very strong precipitate of potash, which by a simple process can be extricated for about five dollars a ton. If this is commercialized it will become a distinct asset to the government of Palestine.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

America is the largest producer of matches but Japan and Sweden are the chief exporters. Figures show that people of the world used 7,675,650 000,000 matches last year for which they paid $200,000,000.

According to a report in a life insurance bulletin, the death rate in the United States and Canada for the first half of this year is lower than it ever has been in the history of the two countries. Death from contagious diseases is steadily decreasing and the infant mortality rate is said to be lower.

A Dutch syndicate is planning to make an attempt to recover the treasure which was sunk in the frigate *Lutine* off the Dutch coast in 1799. The treasure, which consists of gold and silver bars, has been figured to be worth $5,000,000, and only a small amount of this has been recovered. The greatest difficulty is the sand in which the ship is buried.

The department of archeology of Phillips-Andover Academy, in co-operation with the State of Mississippi, has excavated the Indian mounds near Natchez and has found skulls of seventy-two mound builders and some 2,500 pieces of pottery and articles of bone, stone, and clay. The skulls, which are said to be typical of the Indians of the Southwest, have been presented to the Smithsonian Institution and seventeen of them have been completely restored.

According to a report compiled from 1,000 American cities and towns, the total construction in the first eight months of this year was $3,429,000,000. This is an increase of 10 per cent over last year and surpasses all other records. The aggregate for the whole year will probably reach $5,000,000,000.

A new comet has been discovered by the astronomer Finsler, of Borna, Germany, and its presence has been confirmed by reports from Berlin, Lick Observatory and Harvard Observatory. The comet is of the seventh magnitude, just short of being within the unaided vision of the eye, and is said to be growing brighter.

The oldest umbrella in the world, which is in the same condition as when it was purchased in Dorset. England, is in the possession of a resident of Hobart. Tasmania. It was brought there in 1770 by William Clevett and has been a cherished possession of his descendants.

Averaging the best and worst of the business years, 10 to 12 per cent of the workers in the United States are out of work all the time. This fact was brought out in a report made by the Russell Sage Foundation, which has made a study of employment needs and methods for the past five years.

Newspapers in the Dutch East Indies report that strange creatures, half man and half animal, are being seen by the natives of the Poulou Islands. Some authorities believe that they may be the "missing link," as they consider them to be the lowest form of human life, while others declare that they are not men but a species of rare monkeys. An expedition has been sent to investigate.

In Glacier National Park, thirty miles from the railroad, is the only post office of its kind on record with the Postmaster-General. The mail is brought from the railroad and is hung in weather-proof bags on the side of a log cabin, whence it is taken by the residents within a radius of five miles, who are permitted to help themselves.

People of Mississippi are lamenting the loss of one of their finest old plantation homes, which was recently destroyed by fire. This home, which required three years to build, was started in the year 1858. It contained forty-two rooms and was said to have the most beautiful stairway in the South. "Annandale," as it was called, was of historic value also, because it was one of the few southern mansions which survived the Civil War.

At the opening of the Columbia School of Dentistry, Professor Charles Bodecker announced that he had discovered the presence of an organic matrix in the enamel of the adult human tooth. This is said to be of vast importance in the study of dental diseases, and of great value to humanity.

Fridays, Saturdays and Sundays, the Sabbaths of the three faiths in Palestine, are recognized as official holidays for purposes of presentation of negotiable paper, and no promissory notes or bills may be protested on those days.

"I have decided not to care or to know what happens outside of my villa. Every evening I burn before an altar of stone the heap of the day's unopened and unanswered letters. To write to me is useless, to come to my door equally useless. I answer nobody. I receive nobody. My dogs are wise and bite well. Have I made myself clear?" —*Gabriel d'Annunzio.*

Taxes in Colombia, South America, are so small as to be non-existent. A modern hotel on the principal street of Bogota is valued at about $10,000 and the owner is assessed at about $15 a year. Wealthy persons live in magnificent well-furnished houses, while the street outside is so hideously decrepit that it is almost impossible to proceed faster than ten miles an hour in a car. The streets are not drained for the most part and in spring torrents pour through them causing much destruction, according to one traveler.

The Highlands of Scotland have lost their privacy. The secret hiding places of Rob Roy and the clans are exposed to view. The historic Pass of the Trossachs has been opened to the motor car and the char-a-bancs make daily trips from the cities into the former mountain fastnesses of the clans.

Our Fundamental Purpose

The real fundamental purpose of THE DEARBORN INDEPENDENT is to serve as a medium for the dissemination of sound ideas.

This publication does not cater to its readers, but honestly trys to present for discussion those problems which require public attention.

By stimulating thought and discussion among its readers it achieves the main thing necessary to correct existing evils.

Subscriptions will be accepted by any Ford Dealer, or may be mailed direct by means of the accompanying form.

The Ford International Weekly

THE DEARBORN INDEPENDENT

Entered as Second-Class Matter at the Post Office at Dearborn, Michigan, under the Act of March 3, 1879. Additional entry at Chicago, Illinois.

A Study of the Attempt to Foist German Financial Methods on the U. S.

By HAMILTON YORK

This is the first of a series of articles in which will be set forth the elements of a scheme which is intended to place in the hands of a small group of international financiers, not only the arbitrament of the fate of Europe, but control of the destinies of all nations. In this article the activities of Paul Warburg, of New York, a German-Jewish financier naturalized in America, are fully explained.

THE adoption of the Dawes Report establishes a mechanism whereby the world gold is placed in control of the general board of the Schacht Bank, organized at the suggestion of the Warburgs in anticipation of the Dawes Report as a cover for the international group of financiers—of which Mr. Paul Warburg is a member, and the existence of which Mr. Otto Kahn denies.

It would not be possible to make this statement so confidently were it not for another event, namely, that Congress passed an amendment to the Federal Reserve Act in March, 1923, which authorized the Federal Reserve Bank to discount credit paper including foreign acceptances. The Federal Reserve Board waited until March, 1924, before taking advantage of that authority. The resolution of the board which now permits discounting of foreign acceptances was promulgated in April, 1924, almost simultaneously with the issuance of the Dawes Report.

The full significance of the last event does not appear until it is digested in terms which appeal to the German-Jewish banker, which may be stated thus:

By rediscounting German trade acceptances, participating American banks and their depositors are financing the revival of German trade and secondarily Russian trade.

It indicates further that the German Jewish banking system by means of which Germany is now controlled has been imposed upon the United States from without where it could not be made to grow from within.

If the American people are to gain a clear understanding of the system of financial control which is about to be imposed upon international commerce through credit operations, and which has been gradually developing in the United States since the passage of the Federal Reserve Act in 1914, the best way is to observe the system as it exists in Germany. Its home is in that country, where it has been molded into a perfect machine. There, it is dominated by a small group of men, practically all Jews.

Teaching Them to Depend on Credit

IT IS not all a question of the adequacy of the wage which the system allows for service as opposed to what the service would bring in a free and open labor market, but it is a question of the possibilities of exploiting everybody through artificially induced variations in the value of money. Should even the most powerful fail to become a cog in the system, he is economically broken, and he is a lucky man if he can gain a livelihood for himself and his family thereafter. As will be shown, this system of punishments has already been introduced into the United States.

It is perfectly correct to call all this a Jewish system for that mind has developed it through long years of ambitious training and experience. At least as far back as the time of Frederick the Great, Jewish bankers dominated German finance. Itzig, Ephraim & Co., of Berlin, furnished the money for the prosecution of the Seven Years' War and to build *Sans Souci* and the larger palace at Potsdam. Itzig was also a notable leader in the Berlin Kahilla.

Moses Mendelssohn, the earliest of the Jewish Nationalists in a modern sense, was a close associate of Itzig, and especially of Itzig's son-in-law, Friedlander. Already the influence of the house of Rothschild was beginning to be felt throughout Europe. Within ten years after the opening of the nineteenth century, the private banking house of Bleichroeder was established in Berlin, and for many, many years the Bleichroeders managed the personal finances of the Hohenzollerns.

The Bleichroeders and Mendelssohns represented a school of private bankers which has been pushed aside by an invasion of more aggressive Jewish types from the northeast and which apparently had a stronger admixture of Tartar blood in their veins. They were not satisfied to be private bankers, but started in to gain economic control and also to own the state. We must credit the Warburgs, the Wolfs, the Rathenaus and their close associates for building up the present Jewish financial system in Germany. Real control began in the late seventies *as the result of financing state ownership of the railways*. This is a romance all by itself, and well worth the study of anyone.

Extensions of credit, teaching people to become dependent upon credit, were necessary to the development of the modern speculative financial system. Co-ordinate with these was the growth of that external trade necessary for the maintenance of a growing population. As the business of Germany grew and the liquid capital increased, the control became more and more centralized in Jewish hands, until in the last half of the last kaiser's reign, this banking cabal controlled the state. *It was the state.*

Germany could not have started the aggressive war of 1914 without the encouragement and assent of this group. It was this group that staged an *opéra bouffe* revolution to fool the world with the loss of only a few lives. In establishing a so-called republic, it fixed the laws in such a manner that its own position was made more secure, and finally through the active participation of Walther Rathenau, it arranged the relations of big business to the state so that the political organization of the German Reich today is simply a front for this small group of financiers. These men can do as they please, and have done as they pleased, with the German people.

The key to this situation, the fact that allows the persistence of such a pernicious system, lies in the German law which permits banks to hold shares in other banks and in industrial corporations. Until the passage of the Federal Reserve Act, such privileges were not accorded banks in the United States for fear that there might develop a system of overlordship which has reached such perfection in Germany. Eventual control of industry and the banking facilities of the country would necessarily drift into the hands of a few. But the Jewish system of Germany has led and directed such a movement for concentration and apparently with a conscious objective. The result is that the interlocking directors of the greatest German banks, about six in number, dominate the country. This list would include:

The Reichsbank, bank of issue for the government, bankers' central bank, the directors of which are responsible for the depreciation of the German mark and the suffering which it entailed; the Disconto Gesellschaft; Max Warburg & Co., of Hamburg, to which was allocated the shipping industry of Germany and which controlled the North German Lloyd and Hamburg-American Lines; the Deutsche Bank, mainly concerned in development of the metal industries; and the Bank für Handel und Industrie (Darmstadter Bank). It is quite possible to contend that others should be included. It is difficult to draw a line. In any event with the Reichsbank as a key bank, the list is substantially correct.

The outstanding fact is that by a system of inter-owning stocks, interlocking directorates, assignment of spheres of interest, and by mutual arrangement of interests, this banking system is one whole, presenting different fronts in different localities by assuming different corporate names. The control lies perhaps in the hands of a hundred men who cluster in the directorates of the banks named, and whose names appear in the directorates of the largest corporations, and of whom 95 per cent are Jews. As is usual in associations of this character, there are a few who lead. *While the figure of Max Warburg, of Hamburg, may not loom large three thousand miles away as the dominating figure of this aggregation, since the death of Walther Rathenau, the Warburg influence has been the directing force, has furnished the financial finesse which has enabled his group greatly to increase its power, and this has been mainly accomplished through the faithful co-operation of his two brothers, Paul and Felix Warburg, in New York.*

At the present time these bankers absolutely control and exploit for their own gain four-fifths of the internal commerce of Germany, whether industrial, agrarian, or what not. The residual one-fifth represents necessary small transactions between individuals in small communities in which the profit is nominal.

The inquiring individual will immediately wonder how it is possible to include within the above designation the word "agrarian." How are farm products controlled? The history of this phase of their undertaking is an interesting one, and its accomplishment furnished a most difficult task. But it was eventually achieved. The control of the markets, and methods of transportation, the organization of land banks for the purpose of giving credit to the agrarians who in turn *had to be taught to accept credit*, these banks being linked in with the general system, all comprised the machinery which enslaved the farmer. The workingman was captured and held through the imposition of social insurance laws, compulsory health insurance, for instance, as was fully described by Bismarck, who said in his autobiography that these laws were passed to throw a "golden chain about the necks of the workers."

As far as the agrarian program is concerned, the activities of Aaron Sapiro will be found to duplicate the work done by the Jewish propagandists of Germany years ago in perfecting their economic control of the German people.

They Take Toll on U. S.-German Commerce

UNDER normal conditions, and to some extent under abnormal conditions, this group of German bankers is able to raise or depress foreign exchange at will.

In control of the Reichsbank, to which has been delegated by the German Government the authority of issuing currency, a function which the German Government should have retained to itself, this same group can expand or contract the currency as best suits its own personal interest. It must be held responsible for deliberate depreciation of the mark, thereby paying debts with worthless money, exploiting the work of the laborers, and acquiring the real property of the country while building up huge credits abroad.

The story does not differ materially in Germany's foreign commercial relations. With friends, relatives and racial compatriots residing and working in every financial and trade center of the world, these men have extended the system so that it can be said in truth:

> The same group controls the international trade of Germany. It is impossible for anyone foreign to Germany to do business with that country without paying toll to its ruling overlords. Even travelers' checks issued by American banks yield their bit in profit.

This system is under constant pressure outward to include more and more geographical territory. With the exception of Switzerland, *whose bankers have always refused to consider the allurement of credit*, nearly all European countries are involved, and the Jewish bankers of Germany themselves have not been secretive concerning it.

It is all best summed up by Von Bernsdorff in 1912 when he said: "The Empire has gone on until it is now in reality a great corporation itself."

All this is of importance as interpreting to the American mind the causes of Germany's condition, but it is doubly important as showing how Jewish bankers have been able to shape the fiscal policy of the United States.

Many phases of this movement have already been described in THE DEARBORN INDEPENDENT. For instance, there is the agrarian movement which is one integral part of the whole. This comprises the state subsidized machinery to supply the farmer with monetary credit; in other words, *to get him into debt.* With this there has been the development of a system designed to control the distribution of farm products. Familiar names are concerned in this agrarian movement: Bernard Baruch, whose sudden interest in the farmer may now be explained, and Eugene Meyer, Jr., who threw the influence of the War Finance Corporation in such a direction that the Aaron Sapiro societies reaped appreciable benefit. This, with the co-ordinate development of the fiscal system which is to be described, looks to the establishment here of a situation similar to that which exists in Germany.

How Our Monetary "Reform" Began

TO BRING about this sort of a revolution by legislation and education in all fields, the same general principles have been employed.

> **The middle and lower classes are being taught to become dependent upon the state. This is the essence of state socialism.**
>
> **Industrialists are being taught to become dependent upon the banks. The means employed is encouragement of the idea of the use of credit—which from the other side of the fence means debt.**

The financial superstructure which has been erected by Congress since the Federal Reserve Bank law was passed and which introduced into our fiscal system the principle of allowing banks to hold stock in other banks, is supposed to represent the last word in scientific banking and financing. *As a matter of fact it turns out to be nothing but the development of a general scheme for the establishment of a financial overlordship, and part of a larger development, world-wide in scope, which looks to the control of international credit and the control of the world's cover-gold, or gold held to stabilize paper currency.*

As a part of the general movement, the Federal Reserve Board has authorized the rediscounting of German commercial paper in the form of trade acceptances which reach this country through the International Acceptance Bank of No. 31 Pine Street, New York, a bank whose existence is due to the guiding genius of Mr. Paul Warburg. This authorization was made possible under a law passed by Congress and approved March 4, 1923. *The title of this bill was "The Federal Farm Loan Act of 1923."* This means that certain American banks *and their depositors* are financing the rehabilitation of Germany, notwithstanding the fact that German deposits in London and New York banks whereby Germany could finance itself have by no means been exhausted. It should not be forgotten that although on the surface this only covers the financial rehabilitation of Germany, through the Berlin banking connections it insures the financial rehabilitation of the industries in Soviet Russia and its multitudinous dependencies. Non-recognition of Russia will have no staying hand in the process.

Since the murder of Walther Rathenau, brother-in-law of Karl Radek who is the head of the Third International at Moscow, the propaganda organization of the Bolsheviks, the mantle of authority has fallen upon Max Warburg. The Sisson Documents, embodying "the German Bolshevik Conspiracy," published by the Public Information Bureau, of the Wilson Administration, plainly indicate that Brother Max put up the money that placed Lenin and Trotsky in "Leningrad" and brought about the Russian Revolution. Max is now the head of the system of Jewish overlordship in Germany.

The story of the financial adventures of Paul Warburg in America is necessarily a long one, and is best studied by placing it briefly in chronological order. It is not contended that the following table is complete. It only carries one side of the story—his influence on the development of the American fiscal system. But this table and the facts which it presents suggests a line of thought quite sufficient to establish the premise. Successive events of this type are not necessarily accidental; they may be regarded as suggestive of deliberate design

(Concluded on page 11)

"London, city of 8,000 motor buses, painted fiery red, which run like mischief."

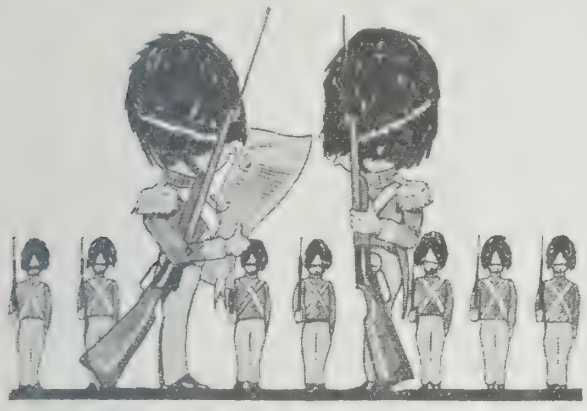
Seeing Things in London Now and Then

By ALLAN L. BENSON

THE first man I saw in London was a gentleman who had sent a radio to me on the ship that he would meet me. He had never seen me, nor I him, but he looked for somebody who appeared as if he expected to be met and I looked for somebody who looked as if he expected to meet somebody and we identified each other instantly. We got into his car and were soon whirling across Westminster Bridge, over the Thames. I told him that the first thing I wanted to do was to send a cablegram home.

"Get out here," he said. "There's a post office substation. Cablegrams are forwarded by the post office department in England."

I went into the office, paid a young woman the



Changing guards at Court of St. James; "quite a ceremony."

equivalent of about $2.50 and she said the message would be in America in three hours. When I returned home I learned that the cablegram had never been delivered.

We resumed our journey in the car and for the first few moments I was so amazed at the speed at which he drove that I noticed little else. We were passing through important downtown streets, but the speedometer seldom dropped below 35 and sometimes went to 40 miles an hour. In New York, the police would have sent in a riot call, if necessary, to haul him into the traffic court. I asked him how he got away with it. He said one might drive as rapidly as he pleased in London provided he did not hurt anybody. But it is well known to drivers that if they hurt a pedestrian, or another motorist, serious consequences will follow. The system seems to work pretty well in England. I saw no accidents in the three weeks that I was in London. Drivers use judgment. Where traffic is congested, they slow up. When the road ahead is clear, they speed up. There are 8,000 buses in London, all painted fire-red and they run like the very mischief, slowing down only at street intersections. I have seen young girls run as fast as they could to catch a bus which slowed down for them to swing on but did not stop. We think New York is fast and London slow, but the reverse is true of motor buses.

We stopped in a little street near St. James's Square where rooms had been engaged for me. I was surprised to learn that I was not to stay at a hotel. The hotels were so crowded that $15 a day for a back bedroom without bath or running water was about as good as one could get. So I was put up in what the English call "chambers," consisting of a bedroom, sitting room and bath, at $6.25 a day. There was no dining room in the house, but meals were served in the apartment if desired. It is really a very good way to live in London. Sinclair Lewis wrote one of his novels in the apartment just across the hall from mine. While I was there Fannie Hurst and her husband came along for a day or two on their way from Paris. The heir apparent to some throne in India that nobody ever heard of was also on the premises. Duke street, which Benjamin Franklin mentioned in his autobiography as an old stamping ground of his, is just around the corner.

Two blocks away is St. James's Palace, the London residence of the Prince of Wales. Charles I slept there the night before he went out to be beheaded. The kings lived there until about a hundred years ago. That is why we still speak of the "Court of St. James." It is probably all right inside, but from the street it might almost be mistaken for a coal yard. That is because it is shut in behind a high brick wall that is old and not ornamental. Not much can be seen over the wall which is set on a line with the sidewalk. Two guards stand at either side of the entrances. Their coats are as red as fire. Their hats are as big as nail-kegs and made of black bearskin. Each guard has in his right hand a rifle, with bayonet fixed, the butt resting on the sidewalk. They stand as still as if they were made of stone. I used to wonder what one of them would do if a fly were to light on his nose. And this vigil is kept up twenty-four hours a day. The same men are not on guard all the while, of course. The various members of whatever company is on duty take turn about. At 10:30 every morning the whole guard is changed.

This is quite a ceremony. I happened along one bright Sunday morning just as it was taking place. I heard military music up the street and saw a company of redcoats approaching. They came with a swing and a stride while the band of the Coldstream Guards played something quick and snappy. Arrived at the palace, they turned a square corner and marched into a small parade ground paved with stone blocks. The commander stepped out of line and approached the commander of the guard that was to be relieved. He handed the guard commander at the palace a document all fixed up with seals and red ribbons. The commander at the palace took the paper and began to read it as if he expected that it might contain the surprise of his life. He went through every word of it. All the paper said was that he and his men were to beat it back to their barracks and turn over their jobs to the newcomers. When the paper had been read the two commanders stepped to the center of the parade ground and began to talk. There seemed to be nothing to talk about but that did not matter. And, at the same time, two men from the old guard and two from the new took positions at opposite ends of the parade ground. And while the bosses talked and the band played, these four men began to walk idly back and forth across the parade ground, the two groups meeting and passing in endless procession. I don't know how long they walked. They may be walking yet. I didn't wait to see the finish, because it did not seem as if it was ever going to come.

The King lives perhaps half a dozen blocks from the Prince of Wales. That is to say, he does when he is in London. Queen Victoria used to have three homes, but King George gets along with two. The late Queen's third residence, Osborne House on the Isle of Wight, is now devoted to some charitable purpose. King George's out-of-town place is Windsor Castle, a few miles out of London. Windsor is the place where English kings and queens are now buried. A dozen or so of them are entombed in Westminster Abbey, but none have been placed there for 164 years.

Buckingham Palace is where the King lives when he is in London. It is a long, low, stone structure of impressive dimensions and lines. It has ample land about it so that it shows off well from the street. In front of it—away out where everybody on the streets can see it—is a huge marble memorial to Queen Victoria, with a very lifelike statue of the Queen. I did not happen to see the King, the Queen or the Prince of Wales while I was in London. The best I got was the King and Queen of Denmark. I happened to be riding past Buckingham Palace late one afternoon when suddenly the motor stopped. Every car in the street stopped. A London man who was with me explained that all traffic halted whenever anybody drove out of the grounds of the palace. A minute later the King and Queen of Denmark appeared. The King looked well and had the largest white shirt front I ever saw.

"Glorious Pepys! If you have never read his diary, get it." Chronicle of the Court of Charles II.

Westminster Abbey contains more great Englishmen than any other building in the Empire, but they are all dead. I suppose different persons come away from it with different emotions. It is a church filled with tombstones. The kings and queens are in a quarter by themselves behind iron fences and locked doors. Every half-hour or so, a guide takes a party through the royal inclosure. Mary Queen of Scots is there and a dozen others, including a king who died about 1,300 years ago. The Abbey, however, is only 700 years old and at that, it is one of the oldest buildings in England. They say the English climate makes it impossible to preserve any building more than a few centuries. The fog, the heat and the cold, together with rain and snow, disintegrate the stone. But in walking through the Abbey, one nevertheless realizes that he is walking back through history quite a way. On the tombs he sees the names of almost all of the great Englishmen of whom he ever heard. Sir Isaac Newton, Charles Darwin and a host of others are there. Also, one sees many names of which he never heard. It has been and still is the custom for the reigning King to order his favorites buried in the Abbey. King George happened to like Bonar Law, who followed Lloyd George as Prime Minister, and Bonar Law is buried in the Abbey. A hundred years from now, Englishmen will stroll through the old church and wonder who Bonar Law was and how he got in.

Great Britain's Unknown Soldier is buried beneath the stone floor of the Abbey. The spot is marked with brass rules set in the stone. Always there is a circle standing around gazing at the spot. France's Unknown Soldier is buried under the left arch of the Arc de Triomphe in Paris, past which tens of thousands of persons go every day. America's Unknown Soldier, because of the comparative inaccessibility of his tomb, is not visited by so many—but he has, by far, the noblest sepulcher of them all. No king ever had a more beautiful burying place than the heights of Arlington, overlooking the Potomac.

Westminster Abbey failed to interest me very much because it was the place where men went when they stopped doing things. Westminster Hall interested me much more because it is a place where men have done great things. Westminster Hall is a part of the present Parliament buildings. Built centuries ago, it escaped the various fires that destroyed other buildings and was made a part of the present Houses of Parliament.

The Hall impresses one, the moment he enters it, with its great size and its great height. It is 239 feet long, 68 feet wide, there is not a pillar in it and the roof is the ceiling. The rafters are the same ones that were put there in 1398.

Here, indeed, is a noble room.

Here Warren Hastings stood when he was brought home from India and impeached by the House of Commons. Here took place his trial which lasted seven years. Here Hastings stood when he made his impassioned address to the Commons in his own defense—and a brass inscription set in the stone floor certifies to the fact. Here Hastings was at last triumphantly acquitted, and here in this room, the members of the House of Commons rose to their feet and uncovered when the man whom their predecessors had impeached entered the room. Read Macaulay's essay on Warren Hastings and you will get a picture that will remain with you throughout life.

The moment I stepped into Westminster Hall I thought: "Pepys used to come here. He used to see what I am now seeing."

Glorious Pepys! If you have never read his diary, get it and read it all your life. Don't try to read it through. Open it anywhere and read whatever happens to meet your eyes. He kept a diary in shorthand that he did not expect anybody would ever see and nobody did see it until a clergyman deciphered it about 100 years ago. Pepys, who often mentioned his trips to Westminster Hall, never failed to note when the king was intoxicated or "My Lord" so-and-so flirted with a new lady. Pepys moved in the royal circle and told all he saw. And Pepys knew Westminster Hall which still stands as it did 300 years before Pepys was born. This, indeed, is a place to see. It is a place where kings did not come to be buried, but men came to do big things.

It was here that Charles I was condemned to die. It was here that Cromwell was proclaimed Lord Protector of England. It was here that Edward III, as a boy of 14, in 1327, was presented to the populace after the renunciation of his father, Edward II.

Another place worth seeing is the old English tavern, built in 1667, in which Boswell and Johnson used to meet. It stands today as it did then, without repairs and without change.

The name of this tavern is the "Cheshire Cheese." It is in a little alley off Fleet Street named Wine Office Court. Outside is a tablet bearing the names of the fourteen English kings under whom the old tavern has existed.

You will find the door open in summer. You first notice the block of stone that serves as a threshold. It is about eight inches wide and ten inches thick. The feet that have tripped in and out of this place during the last 250 years have scuffed off six inches of this stone. You stand back and see an inverted arch in the rock, marking the footsteps of perhaps ten generations of weary travelers from all parts of the world.

The first room you enter is what we in America would call the barroom. You notice a thin layer of fresh sawdust on the floor, which you will later observe in all the rooms. The little bar is bent like a letter

(Concluded on page 14)

"Books have been written about the Old Cheshire Cheese Tavern. The list of famous persons who have visited it reads like a list of great writers of the past 300 years."

Should the Nation Control Child Labor?

Federal Labor Law Would Have Far-Reaching Effects on Farm and Home

By IREDELL MEARES
ATTORNEY-AT-LAW, WASHINGTON, D. C.

The author of this article is a lawyer and in public life, and in recent years has been identified with legal departments of the government at Washington. He is the author of recent law works and not infrequently is a contributor to the public press.

THE Progressive party platform of 1912 advocated a national child labor law. One of its aims was to secure uniformity. It proposed the regulation of the *employment* of child labor, in factory, mine and other gainful occupations, but it was a definite measure, carrying prescribed and limited power. It did not contemplate the control by Congress of all persons under eighteen, which would be the result of the proposed twentieth amendment, if adopted, and Congress be granted the power to *limit, regulate* and *prohibit* their labor, not their employment as to age, occupation and condition of such employment.

The desirability of the law advocated by the Progressive party, at that time, arose from the non-action of many states and dissimilarity of child labor laws adopted by the states, which had acted to protect working children, but since 1912 and at present, the desirability or necessity of a national law has been obviated by the states having adopted child labor laws applicable to local conditions and bearing in their general features a remarkable uniformity.

Thus, of the forty-eight states, forty-one prohibit children working in factories, and so forth, at or under the age of 14; five states at or under the age of 15, and two states at or under 16; or, it appears, in every state there are laws to protect the exploitation of child labor. Again there are laws providing against children working at dangerous occupations, as at machinery, in mines, where poisonous gases are generated, about docks or wharves, and other employments, involving risk of life or limb or injury to health.

Children and Agriculture

THIRTY states prohibit minors under 18, nineteen states minors under 21, and four states any female working under conditions or at occupations imperiling life, limb or health. Further, minors cannot be employed at night work in eighteen states under ages varying from 16 to 18; in four states girls cannot be so employed under the age of 21; and fourteen states prohibit the employment of any female at night work. Still, further, the hours of labor are regulated as to minors from 16 to 17, or under, in one state; under 16 or 18 in eight states, and under 21 in three states. These three states are North Carolina, both as to boys and girls under 21, and Massachusetts and Ohio both as to girls only under 21.

In 1920, according to official statistics, out of a population of 12,502 582 children in the United States, between the ages of 10 and 15, there were engaged in gainful occupations 1,060,858. Of these, 647,309, or 61 per cent, were engaged in agricultural pursuits, and 413,549, or 39 per cent, in non-agricultural pursuits.

The Director of the Census writing to the House Judiciary Committee and speaking of the children engaged in agricultural pursuits remarked that they "probably were not, as a matter of fact, working with any degree of regularity or continuity . . . . The work of these children doubtless varied from a few weeks or months each year to regular employment throughout the year. In fact, 88 per cent of these children worked on farms of their parents—at home."

It may be fairly concluded, as the states prohibit children working under the ages of fourteen, in factories, and so forth, that those stated above as engaged in non-agricultural pursuits were between the ages of 14 and 15 and not under 14.

Of these 413,549 minors working in gainful occupations other than on farms, 11.6 per cent worked as messengers, office boys and girls; 10.1 per cent as servants and waiters; 7.3 per cent as salesmen and saleswomen in stores; 5.4 per cent as store clerks; 5.3 per cent as cotton-mill operatives; 5 per cent as newsboys; 3.1 per cent as iron and steel operatives; 2.8 per cent as clothing-industry operatives; 2.6 per cent as lumber and furniture operatives; 2.4 per cent as silk-mill operatives; 1.8 per cent as shoe-factory operatives; 1.7 per cent as woolen-mill operatives; 1.4 per cent as coal-mine operatives; and 39.3 per cent in all occupations not enumerated.

It further appears that of the 413,549 children between 10 and 15 years engaged in non-agricultural pursuits, 364,444 of such children were 14 to 15 years of age, leaving 49,105 between 10 and 13 years of age or below the standard age.

Senator Wadsworth, of New York, addressing the Senate on May 29, 1924, on the subject of the proposed amendment, said:

> "Undoubtedly, some of those 49,000 are employed in such a fashion as to cause concern. Incidentally, more than one-fourth of those were newsboys. For example, there were but 622 cotton-mill operatives in this group, 404 being employed in the States of North Carolina, South Carolina, Georgia, and Alabama, and 218 in all the other states. So it will be seen that it whittles down to almost nothing. There are only 404 in the four southern cotton-mill states, and there is only a bare presumption that any of the 404 were illegally employed—that is, were below the age limit. A great deal of the outcry and uproar has been directed at those same four states on account of the alleged conditions existing in cotton mills, and we find the conditions do not exist."

Neither the necessity nor the desirability exists today for a national child labor law. The people of the states are equally humane. They can be relied on in any state to force proper legislation, if needed, for the protection of their children. The legislatures of each state can better understand local conditions and legislate for the betterment of the children of their state than Congress or any bureau it may establish at Washington, composed of self-styled child welfare workers, who will undertake to impose their theories, rules and regulations upon the state and its people.

The states in the past decade have manifested and now are manifesting intelligent concern, capacity and willingness to protect children engaged at work and, as theirs is the responsibility, they should not be harassed by the interference of national laws and regulations. Even if this were not true, this proposed amendment to the Constitution is not conceived in the purpose to enable Congress to provide laws to protect children from working at unsafe, injurious, or detrimental occupations, as against employers of child labor, but it is a scheme to control by their labor all persons under the age of 18, whether working on farm, in workshop, factory or in other employment, with or without compensation, and subject them to the direction of executive officials at Washington whom Congress, if the amendment is adopted, will have to intrust with the power to enforce rules "to limit, regulate and prohibit the labor of persons under eighteen years of age."

Let us examine the amendment:

"Section 1. The Congress shall have power to limit, regulate, and prohibit the labor of persons under eighteen years of age.

"Section 2. The power of the several states is unimpaired by this article except that the operation of State Laws shall be suspended to the extent necessary to give effect to legislation enacted by Congress."

It carries a remarkable, a dangerous and an extensive grant of power, and all grants of power, the Supreme Court of the United States has held, imply the power to do all incidental and necessary things to execute the direct power granted. In fact, the United States Constitution so provides

Work Prohibition

UNDER the power to *limit* the labor of persons under 18, Congress may declare such person, male or female, shall labor or shall not labor only certain hours a day; under the power to *regulate*, it may direct such person, male or female, to labor at this or that occupation, with or without compensation and without regard for his or her preference for the work; under the power to *prohibit*, it can prohibit such person, male or female, working at his or her chosen work, or at any work at all; and it may impose fines and penalties for violation of the law it may enact, under this amendment, if adopted, and for violation of regulations prescribed by the executive bureau created to enforce the law passed.

It may pass an act in general terms, in the exercise of this constitutional power, if granted, creating an executive branch or bureau to administer the general provisions of the act and conferring upon the head of such department the power to make rules and regulations to govern the labor of such persons, which will have the same effect as the statute and subject to fine or imprisonment persons violating the regulations so prescribed.

The amendment does not confer the power to prescribe the *conditions* of the factory, farm, mine, office, store, railroad, warehouse or workshop, at which the person under eighteen may or may not work, so as to provide protection for him against unsanitary or dangerous situations, when necessity obliges him to work, or the *employment* of such person, but the power operates to limit, regulate or prohibit the *labor* itself of such person. There is an obvious difference between the power to regulate *conditions* of factory or mine, at which "such person" may work, or his employment, and the power to *limit, regulate* and *prohibit* his labor itself.

As far as "such person" by this amendment is concerned, the factory, or mine, or other place of work, may remain unsanitary, dangerous and revolting, and, while such person might be prohibited from working at such places, because of the conditions, if he does work there, however prompted by the necessity of self-support, such person would be liable for violating the law, but not the proprietor of the factory.

There is no grant of power to regulate the *employment* or *conditions* of the place where a person under 18 may work. Evidently the proponents of this measure were not after controlling the operators of the workshop, so as to guard and protect the children there working, but after controlling the person of all those under 18 by limiting, regulating or prohibiting their labor on farm, in home, in school or college, mine, workshop or factory, and thus to direct his energies, mental and physical, during the formative period of his life, and indirectly to minimize the guidance, control and influence of parents and home environment. The power is there, whether Congress exercises it or not, and there is no limit to it. It is all inclusive.

Under this amendment, if adopted, Congress by direct act or department regulations, which it permits by provision of such act, may make it possible that the boy or girl, however robust, capable and ambitious to work or however necessary it may be that he or she should work to help aged parents, dependent little brothers or sisters, will be prohibited from working at all or their labor regulated as to occupation or compensation, without regard to his or her choice, or to the extent to which they may utilize their energies. To do this, the power is there, without restriction, and lodged in Congress.

Destroying Initiative

THE boy, starting out to make a living and to work his way in the world, as thousands upon thousands of successful men have done at ages under 18, may not consult parents and be guided by their advice, but will have to ascertain the government regulations, limitations and prohibitions as to what he may or may not do in the way of labor.

Nor will the boy or girl of well-to-do or wealthy parents be exempt from the application of the act, and its executive regulations, for the term *labor* is all inclusive, whether the labor be voluntary or compelled by circumstances, with or without compensation, and there can be no discriminations made between rich and poor, but *all labor* of *all persons* under 18 is subject to regulation, limitation or prohibition. So reads the amendment. The power is there.

How many Franklins, Lincolns, Carnegies, Marconis would such a system of regulating, limiting or prohibiting the labor of the boy of genius, ambition or industry produce? It would destroy initiative.

The farmer, who has plowed and hoed himself into the ownership of a farm may not have the assistance of his boy in making or harvesting his crop and the good wife the help or co-operation of her daughter, until, if then, they consult the regulations prepared at Washington; and the mechanic, hard-working and fatherly, cannot allow his healthy boy of 15 to 18 to go out to work, though he may have had a common school education, nor the wife her daughter to assist in womanly and household duties without consulting some professional government child welfare worker as to whether such labor be permitted by law!

There can be no such thing under this amendment as the home of little means, where father and mother, sons and daughters, unite their efforts to produce a common support, and in mutual interdependence find their love and affection deepened, without the invasion of government effrontery, with its regulations, limitations and prohibitions as to the labor of members under 18 years of age of that home.

The boy of 17 may not help to feed stock. The daughter of 16 may not be allowed to sweep or wash dishes. The little children may not attend their father to help in picking cotton, berries, gathering crops, or doing chores about the farm, and the hard-working laboring man or mechanic may not demand of his boy to assist him in his work, without looking up governmental prescribed regulations, lest he violate the law.

The discipline, sense of duty and responsibility, training to habits of industry, which come to boy and girl, in home, on the farm, in workshop, as the result of even hard work, whether that work is in helping parents, without direct payment or in some gainful occupation, is to be limited, regulated, perhaps prohibited by Congress, if this amendment is adopted; at least, the power is therein granted, and, if the power is granted, it is going to be exercised, in greater or less degree, with endless trouble, annoyance, injustice, and no benefit, alike to communities, parents, and minors under 18 years of age.

Where Men Take the Place of the Horse

By WILLIAM L. STIDGER

Water transportation on a Philippine river.

A CIVILIZATION is as forward-looking as its system of transportation. One will always note that if there is a backward civilization it seems to go hand in hand with a backward system of transportation.

In the light of our modern express trains, our sixty-mile-an-hour automobiles, our subway systems, and our "coast to coast in a day" flights in airplanes, a survey of the strange, ungainly and awkward system of transporting humanity, freight and burdens in the Oriental world will be interesting to the readers of THE DEARBORN INDEPENDENT.

We shall begin with Japan, the gateway to the Oriental world. One very soon discovers that the chief means of transportation in Japan, as is true of all eastern countries, is a human being. Only in very recent years has the automobile taken any definite place on the streets and roads of Japan.

The first real shock that an American gets when he visits Japan is the discovery that human life is so cheap that human beings are used as we formerly used horses and cattle, to draw transportation vehicles. The well-known ricksha is the first evidence of this system that an Occidental sees. Thousands of little wiry Japanese men and women get in shafts and draw this two-wheeled vehicle for others to ride. They trot at a dog-pace and pull great loads of humanity up and down hill, panting, perspiring, and weary most of the time. Exposure kills them very quickly.

My first reaction to this human-horse vehicle was anger. I swore that I would never ride in a vehicle where it was necessary for another human being to act as a beast of burden and pull me. But after awhile the newness wore off; and I became accustomed to seeing man-drawn rickshas, and was just as complacently riding in them as the natives. This man-drawn ricksha is the most universal mode of transportation in Japan, Korea, China, Singapore, and Java. The little trotting Hindu, Japanese and Chinese ricksha man is one of the most picturesque sights of the Oriental world; backward, and inhuman, but characteristic and picturesque.

In Japan, as well as the rest of the Oriental world, women carry their babies on their backs. It is an interesting sight to see a little Japanese boy or girl, with his or her baby brother or sister strapped on the back, playing ball, or any of the Japanese games, as vigorously as if that burden were not there. A Japanese child gets accustomed to being carried in this manner, and sleeps and eats and smiles and laughs and lives all day long in this position.

In Korea we ran into an entirely different mode of transportation and an entirely different vehicle of burden-bearing. True enough we have the universal vehicle, the ricksha, but the Koreans use a bull to carry most of their freight. Every highway is thronged with bulls—a diminutive species—and on their backs are strapped the most colossal burdens. You will be walking along the highway and toward you will be coming what looks like a stack of hay or a pile of merchandise as large as a small house. You will not be able to see the vehicle but if you will examine the load closely you will find buried under it either a bull or a boy—as likely one as the other.

Everybody in Korea is a burden-bearer. Every boy, man and woman carries a "giggie," as they call it. This is a strange device which is strapped over the shoulders resting on the hips, with a balancing of the load between the hips and the shoulders which enables the average Korean to carry a weight that an American or a European could not even lift from the ground. To me, one of the real marvels of the Oriental world is this "giggie"; this framework of sticks upon which the natives will carry gigantic burdens for miles. You cannot walk along a Korean highway without seeing thousands of them in a day's journey. Indeed, you are never out of sight of one of these human burden-bearers.

The women of Korea carry their babies on their backs, as do the women of Japan, but they carry their loads on their heads, and I caught many an interesting picture of them carrying great pans of rice, jugs of water, boxes and burdens of every kind on their heads. This is what gives the Oriental woman such poise and grace in carriage and figure.

In China there is the ricksha, and the custom of carrying children on the backs of the women, but the most interesting vehicle in China is the creaking, shrieking wheelbarrows which are used all over the Shantung peninsula. Literally thousands of wheelbarrows shriek their way along the streets and highways of Shantung.

The Chinese have a superstition about using animal fat, and, therefore, they do not grease the wheels of the barrows, and a thousand of them passing in single file through a village causes the most deafening and penetrating din I ever heard.

There is also what is called the Pekin cart which is used to transport human beings in China. This is a two-wheeled cart, awkward, lumbering, and hard to ride in, but all persons who have traveled extensively in China will remember these carts, drawn by a little horse in two shafts, jolting over roads rough enough to break a man's back in an hour. I have ridden for days in them when no other mode of transportation was available.

A third vehicle of transportation in China is the sedan chair, which is also used in other eastern countries but not so extensively as in China. They are made in every shape and size, from small single chairs to great canopied, luxurious private cars in which several may ride. The load is carried by men between two pairs of long shafts which extend under the chair rear and forward. Great funeral cars are carried in this manner, and take from a hundred to two hundred men to carry them.

Above—Transporting a car, a bishop, his wife and a few Americans across a Korean river.

Right—A Korean carries his cooking utensils on his shoulder via his "giggie."

Left—How the Korean woman carries her burdens.

A peculiar type of chair is used by the coolies to take people up the steep sides of the sacred mountain of China.

In the Philippine Islands there are few rickshas, but very distinctive modes of transportation. The carabao is a great, big animal, similar to the buffalo. It has huge shoulders and it is used to pull great clumsy carts. Much of the freight is transported in this vehicle in the Philippines. The passenger vehicle is the little two-wheeled "carretela" which is loaded to the gunwales. The streets of Manila are thick with them. They are drawn by little ponies which dash madly through the streets driven by brown Filipino boys. They are the jitneys of the islands. The women of the Philippines are like the women of Korea in that they carry their burdens on their heads in a *dulce* basket. You can see these straight-shouldered females in every village, along every highway, carrying on their heads a load half as large as themselves—bananas, pineapples, cocoanuts, chickens—smoking big white cheroots, and chattering away with a companion.

A Chinese mountain chair carried by two coolies.

The "Covered Wagon" cart in the Philippines.

An interesting device for transporting water is a long bamboo tube or tree on two little wheels. As much as half a barrel of water can be transported in one of these toy-like devices, and a boy can push one of them. The carabao cart in the Philippines is often just two big solid wheels that have been cut from solid wood, wheels without spokes on which a bed is laid without sides, pulled by big clumsy animals which look like Texas steers.

There is also a sort of a "Covered Wagon" cart in Northern Luzon in the Philippines. These carts are on two wheels but with a cover exactly like our old prairie schooners and pulled by carabaos or ponies. I have seen hundreds of them lined up at the dog market in Baguio.

The camel is a beast of burden in Northern China just as it is in Egypt and other Oriental countries. It is no uncommon sight to see a great camel train arrive at Pekin from the Mongolian plains, and to learn that it has been on the way to Pekin for two years.

Up in Siberia great awkward carts and wagons and sleds make up the bulk of the transportation vehicles in use. They have wooden frames that look more like an oxen-yoke than anything else. One may see great trains of these, sludging along the winter roads through the heavy snow and ice, and at market time in the summer hundreds of them will line the public square. They are drawn by small horses.

Water transportation in the Oriental world is just as fascinating as land transportation.

Which of us who have traveled in the Orient will ever forget the sampans that come out to meet the ships in the Chinese harbors—flat-bottomed boats loaded to the water with an entire Chinese family who sell things to the incoming tourists and passengers. This is one of the characteristic sights on entering a Chinese port. The waters literally swarm with these sampans. Up the Yangtze coolies are the motive power that pull the boats through the rapids; a missionary made himself famous up and down the entire length of this river by putting in handholds for the coolies to grasp as they struggle through these gorges along the narrow cliffs and defiles.

Every Oriental river country has its own type of water transportation. The Chinese with their sampans can go anywhere. They go out to sea fearlessly. Jack London's *Snark* was a mere child's adventure compared with the daring of these Chinese in their sampans.

At Singapore, Shanghai, Batavia, Sourbayia and a half-dozen ports of the Orient, including Canton, millions of human beings are born and live and die on houseboats and never know what it is to have any other kind of a home.

Great flat-bottomed boats are used in Korea, propelled by a long pole that reaches to the bottom of the river ways, or a great flat oar that is also propelled by man-power.

Now and then, as in the case of the crude water wheel one finds in Korea, some enterprising Korean gets power from running water.

The little narrow canoe-like boats that the Filipinos paddle to market, laden with pineapples, bananas, and cocoanuts, fill the Philippine waters at all seasons.

In Borneo, I rode for hours in a little canoe-like boat with a canopy to keep the sun off. It was awkward and uncomfortable, but it was the only mode of transportation possible in a jungle infested with great snakes, orang-outangs, crocodiles, and other wild animals. The river ways are the only safe and possible paths of commerce in Borneo.

Mussolini, the Modern Caesar, Face to Face

"My Father Was a Blacksmith Who Bent Red-Hot Iron," Dictator Declares

By JOHN HUBERT GREUSEL

Mr. Greusel, who recently returned from a long tour of Europe, was much interested in social conditions. His study of Mussolini and Fascism, told in two articles, should be of very great interest to Americans, as the complex movement has been set forth with the necessary philosophic and historical background, "and is written in a way so you can understand it." We have all read in general that Mussolini is of the classical stature of a Caesar; now you are to meet this modern dictator face to face.

"I DO NOT come of illustrious forefathers," Mussolini told the Milanese ironworkers, after he had accepted office as prime minister. "My ancestors were peasants and worked the land. I have been a navvy and a stone mason. My father was a blacksmith who bent red-hot iron on the forge, and I as a little boy had to help him in his hard humble work. Now I have a harder task in trying to bend the souls of men."

The Italian dictator is a singular compound of the religious mystic and the practical political realist. He has been called a Caesar, but he is more than that, as we shall see.

Even as Savonarola conceived the subjugation of the world to sacerdotal power, "in the universe saw but one God, the priest his sole minister, mankind obedient," likewise Mussolini has a similar vision in the sordid world of politics; and to his mystical mind the state must be served with the living faith of primitive Christians. The Dominican monk who was tortured to death on May 23, 1498, had long thundered against the sins of luxury-loving Italians. His words were as scorpions with which he flogged the bare backs of his countrymen. An ancient chronicler says: "Florence rushed to the public square, made a bonfire of vanities, flinging into the fire their wigs, carnival costumes, costliest jewelry, their cards, dice, and evil books."

Nearly five hundred years later we find a veritable reincarnation of Savonarola preaching a political crusade. Mussolini has a strange dream, yet it is not all a dream. Fascism is one of the shrewdest, most cold-blooded political movements. Can you imagine a politician who, without being a religious man, brings to his aid an inspiration that is at once practical and mystical? It is an extraordinary spectacle and deserves deep study.

Chief of the Black Shirts

RALLYING around the symbol of *Patria* or *My Country*, Fascism takes on the force of holy faith. The very oath that the Black Shirts swore when Mussolini organized them for the civil wars shows a note of medieval mysticism; and Mussolini began by doing precisely what Savonarola did at the celebrated bonfire of vanities. This was the solemn oaths: "We the Black Shirts, by the blood of 2,000 martyrs whom we evoke as witnesses and judges, hereby declare that we will not wear on our persons any gold, silver or precious metals or stones. We will work ardently and without pay for the good of our country, will give all superfluous ornaments to a fund for supporting enterprises having goodness, civilization, beauty and Italy's improvement as their objects."

He blows his bugle and all Italy responds as though medieval knights inspired by the love of God were once more summoned to a Holy War, in a modern version of rescuing Christ's tomb from the Saracens. The tomb is Italy, the Saracens are Italy's enemies.

We miss entirely Mussolini's genius if we merely regard him as a pugilistic Caesar who rapped a few revolutionists over the head. For that matter, all down the centuries in many countries revolutionists have been tarred and feathered, hanged, quartered, burnt alive; but no new national consciousness necessarily resulted.

Mussolini's violence against Socialists was only an episode in his larger program of making a religion of the state. It started with a few Black Shirts and now it is the National Fascist party. Though Fascism is battle-born it does not represent violence. In Italy, Mussolini says, there must be ultimately only one social fact. That fact is Italy, and Italy means all her people. Italy must at last come to represent the individual faith of citizens in themselves.

In defining his task, Mussolini speaks with brutal frankness. He always does that. His speeches are keyed in the defiant tones of the curbstone orator haranguing a crowd. This is the way he defines his task: "Liberty is not an end; it is a means. Now is the time to speak of force! As liberty is a means to an end, it requires control. I beg of you to show me in all the course of history a government that based itself entirely or exclusively on the consent of the governed, and renounced all forms of force. Such a government there never was, and never will be.

"How are you going to prevent discontent from becoming a menace to the state? By force! By the inexorable use of force, whenever necessary! The truth is apparent to every man not blinded by dogmatism, that men are perhaps weary of liberty. They have had a surfeit of it. For the intrepid youth, restless and eager, who present themselves at this new dawn of history, there are other words that move them more deeply, words such as discipline, deputized national authority. Know then, once and for all, Fascism recognizes no idols, adores no fetishes. It has already passed over the more or less decayed body of the goddess of Liberty, and is quite prepared if necessary to do so once more."

In the face of Mussolini's subsequent rise, it seems to be forgotten that there ever could have been two sides to the war. An old-time treaty had pledged Italy, Austria and Germany; and for many years the pact stood. One of the historical riddles is to say just "why" Italy changed her mind, at precisely the most critical moment.

That drama of passion and popular aspiration awaits its final explanation.

Italian Socialists were from the first opposed to war, and Mussolini himself had been a very strong Socialist. His fervid oratory marked him as leader of the Socialist cause.

Then came the break. He started a fiery pro-war paper, *People of Italy*, and joined with the poet d'Annunzio in a furious demand to possess Italy of old-time territorial areas. It was something like the controversy over Alsace-Lorraine transferred to Italy.

S. E. BENITO MUSSOLINI.

At bottom, the Socialists believed in peace and brotherhood, which was very fine; but the party never developed any political sense. For one thing, Socialists threatened property owners, told them, "Your hour has come." This was not Socialism: it was Communism.

The very system of the Terrorists pushed Socialism into the ditch. Under the teachings of Lenin, Socialists seized the farms, factories and ships and decided to "divide up." In that foolish way Socialism lost the support of the working class, farmers became frightened and tried to get rid of their lands. In short, Socialism instead of bringing light and liberty proved worthless.

Under various ruses the Socialist party took immense rake-offs from the governmental funds, till the whole system became an organized conspiracy against the state.

But all this and much more like it was merely incidental to general social disruption. Gross acts were charged to the Terrorists: Right of baptism was denied; church services and religious processions were banned; even the dead were denied; strewing flowers or lighting candles on All Saints' day was strictly forbidden.

Peasants, inspired by Communists, were told, "The land belongs to you, seize it, leave owners without redress." Independent workers who did not enroll in Communists' clubs were taxed double, or beaten.

As a rule, Socialists and Communists were armed with knives, but citizens had to fight back with fists.

Although Italians are proverbially fond of music, laborers were strictly forbidden to sing at their work.

Mothers working in the fields were allowed to stop only half an hour once a day, to nurse their babies.

War Against Socialism

ALL sorts of nuisance taxes and stiff fines were imposed, while browbeating and blackmailing of laborers took place daily. Customary discipline of laborers was with the whip, and floggings were severe and numerous. This practice Communists had imported from Russia, their native land.

Another form of persecution was to notify a farmer, "You are wanted at headquarters," and after he had walked, say, ten or twelve miles, a bureau chief would ask one or two foolish questions then make this order: "Come here again tomorrow." This would go on for thirty days.

Landowners were not allowed to use reapers or mowers; only hand labor; and unless favored by local Socialist boards of control, crops rotted in the fields while the pampered pets of bureaucrats were well served.

During the war, Italy's Terrorists stole the soldiers' food, mixed iron filings with bread, put rubbish in flour, "lost" Red Cross parcels by thousands.

Through political influence Social bureaucrats had been exempted from military service, and after the war spat on returned soldiers, claiming they were dupes and fools, misled by the king.

Officers in uniform were not allowed to ride on railroad trains, and if caught were put off between stations. This was possible because the Socialist bureaucracy controlled the labor on the state railroads. Employes were as numerous as bees in a hive and all were looking for soft jobs under the government.

Many a brave veteran had his medals torn from his breast by Socialist mobs. The government was powerless. Socialist police refused the riot call.

Veterans were requested to confine themselves to back streets. To treat soldiers like wild beasts was customary, provided the men attacked were not Socialists or refused to come into the "Red" societies.

Socialist co-operative leagues harbored thousands of deserters, prevented the authorities from bringing slackers to justice.

Mussolini, himself a Socialist, lived to curse out his former gods of the party and began fighting for orderly national interests. That meant fighting the "Red" dragon of Italy.

The king's ministers as well as the king himself kept very quiet, showed no fight. Perhaps the king feared that one fine morning an army of fishwives would march to the palace and stick on his head the red cap of liberty, then take him to the guillotine.

Whether or not Mussolini's tactics, by which he rose to dictatorship, were not as tyrannical as the methods of the "Red" bureaucratic forces he combatted, need not be discussed. His Black Shirts "carried on" much after the manner of the American Ku Klux. Many murders were committed right and left, but the motto of the Black Shirts was "Our Country, Not Ourselves."

The Castor Oil Squad

THERE is no doubt that at the height of his success, Mussolini might have denounced monarchical forms, deposed the king and turned his supporters toward a modern republic headed by a president and a congress. That is, however, exactly what Mussolini did not do. Later, we shall tell you why.

In 1919, the Fascisti numbered only 10,000 names; the next year, the enrollment doubled. The young men were told, "You are fighting for Italian nationalism, against internationalism under the cloak of Socialism."

Ferrara awoke one morning with 50,000 laborers on strike. Dreadful riots followed and at least 5,000 Black Shirts decided to clear the situation by "direct action." They cut off the water supply of the town, cut off the lights, closed public markets that food might become scarce and everybody starve on strike. It broke the strike in a few days.

A guard of 50,000 Black Shirts were on police duty at Bologna. The Socialists held an election, the Black Shirts smashed the ballot boxes, stormed headquarters, captured the Red flag. In the rioting many were killed or wounded. Both sides used hand-grenades, revolvers and clubs.

The Socialist leader, Bombacci, managed to escape from the city, disguised as a policeman. A few months later his secretary was found in Rome. Black Shirts shaved his hair and beard, painted the Italian flag on his crown, exhibited him like a circus animal on Rome's principal street, the Corso, to the vast amusement of the crowds.

Other horseplay by Mussolini's men showed an imagination worthy of the devil. Castor oil squads were organized, midnight visits made. Leaders of the enemy were seized and forced to sign papers acknowledging the supremacy of the Black Shirts. If that failed, castor oil was used. A pint was the usual dose, divided in two tumblers and while a Black Shirt held the victim's nose others of the squad forced the nauseating oil down the Socialist's throat. During the sick-scene that followed, the Black Shirts stood round and enjoyed themselves. Castor oil treatments were usually written about as an immense joke.

The rioting at Ravenna destroyed forty houses and Socialists' belongings were scattered through the streets. In Genoa, 20,000 of Mussolini's men forcibly occupied the municipal building, headquarters of the Socialist bureaucrats. In retaliation, Socialists declared a nation-wide strike, and following Mussolini's tactics at Ferrara, all Italy was to be deprived of water, light, food, transportation, by the Socialists. Mussolini's comment: "Let them strike; it will be their deathblow. If the government is too weak to end the war, the Fascisti will!"

Within forty-eight hours civil war broke out. This general strike took place in August, 1922, and Mussolini flew by airplane to Rome, offering his services to the timid king.

Fascisti used revolvers, bombs and whenever possible flogged Socialists. Many a public square was cleared by armed troops; hundreds of houses were wrecked, property damages reached millions of lire.

When the cause was won, 120,000 Black Shirts marched to Rome, offered their services to the king and were accepted joyfully as liberators. Mussolini became the king's strong man and now fights for vested authority. In the critical days his Black Shirts had most successfully cracked skulls right and left, acted outside the law. It was a great problem what to do with the Black Shirts. Like Augustus Caesar, who waded to his throne through seas of blood, Mussolini immediately turned and posed as a mild ruler, denounced violence, absorbed the Black Shirts into the national militia to give them official standing.

Outwitting a thousand enemies, the former obscure Socialist editor is now in a position in which as dictator he hands Parliament a batch of bills, saying abruptly, "Pass the first 100 because I ask it. Otherwise, hand in your resignations."

And he is obeyed.

Mr. Ford's Page

THERE is nothing in our social, political or economic life that does not depend on Business, the production and distribution of the commodities necessary to life. The home, the church, the school, the government, all depend for their continuity and sufficiency on Business. Even those who affect to despise business, and rate art and the vaporous idealism higher, have to admit that without business the artist is thwarted and the idealist rudely jarred.

And business itself depends on a profit. However useful the commodity which an individual or an organization may make, if it is produced and sold at a loss, its production ceases. There is nothing in quality of goods or quality of service that can overcome the economic error of selling at a loss. Profit is essential to business vitality, just as vigorous physical life is dependent on storing up a little more energy than we lose. That is the way all life advances to maturity. Even the day's breath and food and exercise must yield a physical profit, or the body goes backward to failure.

But the motive to profit has various phases. One organization must have profit to pay the demands of numerous persons who have invested in the business but who have no hand in its operation. They are absentee dividend-takers. What goes to them does not strengthen the business but is taken out of the business and may go to swell the sum of idleness outside. For when you see great paradises of idleness throughout the country, you must remember that they are all supported by men who are at work. There is much justifiable idleness, of course. Looking over our country we see millions of children in school; their leisure and education are made possible by the fact that men are at work. Likewise with the aged and infirm. But there is unjustifiable idleness, and that, too, is supported by men at work. This is the load which businesses like railroads bear—they have to take from themselves to pay for the freedom from toil of those whose money commands a share of the railroads' profits.

Then there is the type of business whose principal objective is the swelling of someone's personal fortune. A business which exists to make one man or one family rich, and whose existence is of no moment when this is achieved, is not solidly founded. Indeed, the motive of personal gain may cause such decrease of quality in goods, such curtailment of service, or such arbitrary charges to the public, as to endanger the life of a business long before it has contributed to anybody's fortune.

These are common enough motives in business, but their day is passing; it is almost over. A business should pay everybody connected with it, and for every element used in it. It should pay for managerial brains, productive ability, contributive labor, and it should pay also the public whose patronage supports it. A business that does not make a profit for the buyer of a commodity, as well as for the seller thereof, is not a good business. If a man is not better off for buying than he would be if he had kept his money in his pocket, there is something unequal in the deal—for the true Economics of Profit include Maker, Distributor and User. Buyer and seller must both be wealthier as a result of a transaction, else the economic balance is broken. Pile up these breaks long enough, and you upset the world. We have yet to learn the treasonable and hostile nature of every business transaction that is not just and profitable all round.

The business itself, the organized entity that engages in production or service, needs a profit or a surplus to keep its vitality a little in advance of the drain upon it. This surplus is to prevent depletion under extraordinary strain, also to permit of expansion. These are precisely the reasons for the body needing a profit on its daily living, or a surplus of vitality—to resist the effects of adverse circumstance, and to grow. Growth is necessary to life, and growth requires a surplus.

It will be noted that this statement is made of *the business*, not of the owner or director of the business. He is paid, like any other worker, out of the costs of the business. In true economic business life, the profit belongs to the business, for it is to safeguard the business in its task of giving service and to permit of its natural growth that a profit is justified at all. The main consideration is the business—this entity that gives employment to producers and gives useful commodities or needed service to the public. In this sense, there is something sacred about a business. It becomes one of the molds of life.

The principle of service requires that profits be measured by these needs—legitimate replacement and necessary expansion. More than that tends to upset the economic balance. Yet there is sometimes heard complaint against expansion as if it were the likeliest cause of economic danger. If expansion is undertaken in the interest of service, quite the opposite is the case. The tax paid by the public on constricted, inefficient, non-growing businesses is much larger than it is on businesses that expand massively.

Take a present instance: A manufacturer of a commodity which the public needs and buys and profits by is threatened with curtailment of his service. First, the mismanagement of businesses that supply his raw material leads to strikes which imperil his supply. Next, the old dying policy of charging all that the traffic will bear is used upon him, and runs up prices unreasonably, preventing him from producing his commodity to his customers at a price which is right for him and for them. He finds himself at the mercy of the misleaders of labor outside his business, and the profit-gougers who supply his raw material.

Obviously it is his duty to protect his customers. They need a certain commodity at a price they can afford to pay, and they are threatened with seeing this utility forced up to a price which they could ill afford to pay—a price that would destroy their profit in buying and using.

How can they be protected? By making the coal, the ore, the limestone, the lumber, indeed, all the elements of his commodity a part of his business; by making them all serve the same end, namely, the production of a needed commodity at a price the users of it can afford to pay. In doing this he is not erecting a "trust," he is not "cornering" anything, he is merely making his business free of a score of outside hindrances that threaten the economic balance that exists between it and its customers.

Now comes the test. In every one of the raw materials used, there was a profit. A coal profit; a limestone profit; an ore and blast-furnace profit; a lumber profit; a transportation profit—profits all down the line. Is this manufacturer to collect for himself each of these profits, and add it to the profit he receives for turning these raw materials into an article of use? Not if he is a true business man operating on the principle of service and taking only a legitimate replacement and expansion surplus. No; he abolishes these other profits, now that the various labors are organized into one business, and gives the ultimate consumer the benefit of them.

The former profit which the public gave him to enable him to expand now comes back to the public in the forms of a stabilized supply, a stabilized cost price, and a lower sale price. The number of the profits saddled on one commodity has been reduced by the exercise of managerial foresight and initiative.

The test of everything is in how far its benefits are passed on to the consumer. If it is an addition of profits instead of a reduction of profits, it may be dangerous. But the reduction of profits, in number and amount, on any commodity is an instant and general community benefit.

WHEN is a profit honest? When it replaces the energy used in production and adds a surplus for healthful expansion. A profit is always with reference to the business itself; the reward of those engaged is a part of production cost. Legitimate profit is that which stabilizes the business and assures its continuance and improvement in service. This principle, therefore, includes the public. A good business will make a profit for the buyer as well as the seller. If the buyer is not better off than if he had kept his money in his pocket, there is something wrong. The profit that replaces energy should return to the buyer in the form of sustained service. The profit that permits expansion should return in better quality at lowered cost. Expansion to any degree is justified when it increases service and lowers cost—but not otherwise.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Ontario Is "Dry"

ONTARIO voted strongly "dry" after the most confident claims of the "wets" that the province was tired of temperance. Aside from this reversal of prophecy, the election was notable for the sharp difference in attitude between city and country; the cities for the most part heavily "wet" while the country districts were consistently "dry." No one has yet appeared to hazard the explanation that the difference is due to the greater ignorance or viciousness of the country districts. There may be an occasional charge of greater "narrowness" in the country districts, but not a greater stupidity or moral indifference. The vote would indicate that moral indifference, or active approval of liquor, is more to be found in the cities. Where life is lived artificially, where amusements are hectic and unwholesome, where interested propaganda circulates most freely, where the public mind is addled by the superficialities of newspaper dogmatism, there the liquor interests are likely to find their chief support, but not in the country districts where life is more wholesome and where people have time to think their own thoughts.

United States readers of Canadian prohibition plebiscites are sometimes misled in their judgments. In Canadian elections which have "gone wet" the significance is not what the American would naturally understand by such a statement. In no case has the saloon been voted back into existence. In every case the saloon has been voted a continued oblivion. Most Canadian elections have turned on the question of the method by which liquors shall be handled by the government and the degree of accessibility allowed to citizens who purchase by the package. Had Ontario "gone wet," it would merely have meant that its citizens desired some other method than that now followed by the Ontario Temperance Act. The saloon is as dead in "dry" Canadian provinces as it has been at any time since prohibition, but the Ontario election indicates that a deeper "dry" sentiment obtains in a majority of the people there.

What About the German Loan?

NO AMOUNT of protest could have delayed or modified the United States' foreign financial policy which is popularly known as the Dawes Report. The policy was determined long before there was a commission, long before there was a report; these were but the scenery of an international play.

One objection to the plan may be at once discounted, namely, that it will revive German industry at the cost of American prosperity. If American prosperity is built upon the necessity of keeping the German workingman idle and impoverished, then there is something fatally unhealthy about our prosperity. The American people would never vote the economic destruction of another people, solely to maintain our own status. Our economic sufficiency must be built on more dependable and civilized foundations than that.

But there are two things the American people would like to know, and the first is, how far this transaction involves the American government. Is this a private loan between bankers, or is it a deal between governments? The question has been asked of President Coolidge, but he has not as yet answered it. And it should be answered. The semi-governmental institution known as the Federal Reserve System is intimately bound up with the German business (a fact little understood in this country), while the Report itself clearly shows that the institution organized in Germany to handle the transaction is rooted deep in German political responsibility.

Here are all the materials for military pressure, or a war, should Germany's condition ever lead to her default. And this is what the American people would like to know—In how far are American citizens liable to be called to military service to make good the American loan? It is this question which President Coolidge should answer in his own clear style.

It may be said, of course, that wars or threats of pressure need not occur at all. They are not inevitably in the situation. It all depends on the honesty and efficiency with which the business is carried out. Financiers may have risen in the scale of international morality since 1914—let us hope so. Their motives in the present matter may be touched with the spirit of world altruism. But, even were this all true, it is no substitute for a plain answer to the question, In how far may the military power of American citizens be used in the interest of this financial transaction? Frankness at the present moment will prevent future suspicion.

No one guarantees that the loans made to Germany will have a good effect on that country. Bankers themselves frankly refuse to prophesy. The Germans are exceedingly doubtful. In Europe, where the situation is much better understood than here and where propaganda is less successful, participation in the loan was neither popular nor financially large. The feeling seems to be that while German—or international—financial interests may be benefited, the benefit will not seep through to the people. And yet it is the people who will have to create by their labor an amount of wealth equal to the principal and interest of these loans if they are to be safeguarded and repaid. Thus the second inquiry which many are making is just this: Will the German people themselves, in their actual living conditions, become the beneficiaries of this immense financial effort? Time will answer this inquiry, but the expectation of the rank and file of the German people is not highly hopeful.

There can be no objection to the loan as an experiment in international neighborliness, if it is honestly intended to be such. Even the loss of the loan would be bearable if it were used honestly to assist a distressed people. But if it is merely a revival of the old game of international finance, if it cloaks a subtle scheme to make our Federal Reserve System the ready agent of American and German Jewish houses, if it designs to use American military power to enforce its claims, then it is about the most dangerous move that has occurred since the Armistice. Since there is so much difference of opinion and even obscurity of understanding among financial minds on the merits of the Dawes Report, a plain and interpretative statement from the President or Secretary of State would be cordially welcomed by the people.

The Rosenbluth Case

THE trial of Captain Rosenbluth and Sergeant Pothier for the murder of Major Alexander P. Cronkhite has been held and the two defendants acquitted. Rosenbluth did not appear on the stand. Thus comes to an orderly end a long and sensational attempt to block the processes of United States courts and to prevent the trial of a man indicted for high crime. The shameful interference of racial organizations and the hysterical efforts to make of Captain Rosenbluth an American Dreyfus were amply illustrative of the length to which an alien type of mind will go to neutralize the safeguards which have been set up for the people in our laws and courts.

At no time has THE DEARBORN INDEPENDENT expressed an opinion as to the guilt or innocence of the two accused men. Its only interest was to see that the processes of law were carried out in the case of Rosenbluth as of any other citizen. That end was achieved. Further horseplay with the courts of the United States was made impossible.

At the same time there need be no pretense of believing that the trial cleared up the mystery of Major Cronkhite's death. The confession of Pothier implicating Rosenbluth is still unexplained. Whether or not justice has been done to Rosenbluth and Pothier, there is a large body of public opinion that justice has not been done to Major Cronkhite.

Hail the Heckler!

BECAUSE Americans who have observed election meetings in England have voiced their objections to heckling, some newspapers have conceived wrong notions of the practice.

What these Americans witnessed in England was probably not heckling at all, but a form of rowdyism consisting of interruptions of the speaker and offensive remarks shouted from the body of the hall. Such are disturbances and interference with the right of legitimate speech, but heckling in its true sense is an entirely different thing.

Webster defines the word "heckle" as: "to badger with questions or gibes"; but it does not follow that heckling should take this form. It may have been the custom in the days of "Noah," but some of that eminent lexicographer's definitions are as archaic as the system of shipbuilding and water transportation initiated by his patriarchal namesake.

The name seems to have been derived from the heckle or hackle, a toothed instrument used for cleansing flax or hemp from the tow, hards, or coarse part. That is exactly the object of the genuine heckler at election meetings. He is no mere rowdy or interrupter. From his place in the audience he listens to the arguments of the speaker with a critical ear and at the close of the speech proceeds to clean up the oratorical flax and extract from it the tow and other coarse material. In other words, his object is to separate the wheat from the chaff.

Many a platform orator by flowery flights of speech hypnotizes his hearers into a state of enthusiastic approval of something of which they have only acquired a vague conception. The speaker may have spoken for hours and "said nothing." It is at the close of such a torrent of "words, words, words," that the heckler gets in his work. His questions are pointed. He is not only critical but analytic. He wants to get to the bottom of things and to evolve something really tangible and constructive. He wants to know how much of the pabulum dished out to the audience is real meat and how much of it is waste.

Genuine questions put at the close of a public meeting should not only be permitted but encouraged. It is the only way to find things out to form opinions. Teachers in schools and colleges welcome hecklers among their pupils. Why should not politicians do likewise?

Shall We Rear Loafers?

MEMBERS of legislatures and all others who are interested in repelling the insidious attacks made upon the Constitution of the United States will find it worth while to read the article found on page four of this issue under the title, "Should the Nation Control Child Labor?" It shows the extent to which the states have already controlled child labor, and the uselessness of further tampering with the Constitution. It is seriously worth the consideration of state legislators whether they shall aid in these frequent and alien-originated raids upon the fundamental document of our nation, just as it is seriously worth the consideration of the women of the country whether they are to allow their humane instincts to be used as a cover for the activities of groups whose ultimate designs are anti-American.

The prohibition of work up to the age of 18 (the sponsors of the amendment wished to make it 21) would almost certainly rear a generation of loafers. Young men and women of active temperament would be forcibly repressed in their natural rights—and repressed, too, by the law of a free Republic. Such an amendment in force during the last fifty years would have robbed the nation of every constructive leader we possess today.

Agitators for the amendment say, "Of course, it only grants Congress the power, it does not compel Congress to exercise it." What, then, is the purpose? Is it to render the Constitution less and less respected by the people? Or is it eventually to force Congress to prohibit healthful and useful activity on the part of every one up to 18 years of age? Is tampering with the Constitution so simple a matter that it should be done every year at the behest of a group of political women who do not, for all their claims to the contrary, represent American Womanhood?

It was stated on the floor of the United States Senate by a Senator who had visited Russia that he heard in Moscow from a Soviet authority the whole plan to "nationalize the children" of the United States, of which the Child Labor amendment was the opening wedge. The Soviet connections of those most active in behalf of the amendment have been amply established.

Let us adopt a standard principle in these matters. Let us determine that, henceforth, *the Constitution of the United States shall be amended only to increase the people's liberty, not to curtail it.*

How One State's Gold Saved the Union in 1861

The Work of the Miners Provided Wealth That Prevented Disruption

By ROBERT MORGAN

HALF a billion dollars' worth of gold, coined in eagles and double-eagles, and piled in an inconspicuous building in the heart of San Francisco, once saved these United States from disruption, shortened the Civil War, and convinced a watching world that this Union would persist, a power among the nations. The gold came from California mines, in the short period between 1849 and 1861—twelve years, most of them taken up with the greatest and most productive migration in search of the yellow metal ever staged on earth. Few persons living today know of this momentous incident in the course of the Civil War, and it is written into few histories. So barren are our school textbooks of all human interest that it is doubtful if one child in the public schools outside of California knows this story, yet it is one of the most vivid chapters in the record which began at Fort Sumter and ended at Appomattox Courthouse.

The United States Mint was established in San Francisco in 1854, two years after instructions for its establishment had been issued at Washington. Between that year and 1861, the miners of California had poured into this plain, square, three-storied building on Montgomery street, between California and Sacramento streets, in San Francisco, more than $700,000,000 in gold. When, on April 24, 1861, a Pony Express rider brought to Sacramento the news that Civil War had broken out, there lay in the mint and in the subtreasury of which the mint was a part, approximately half a billion dollars in coined gold. If the seceded states could draw California into their confederacy, thereby taking over this mass of gold, they believed their cause would be won, at least in the eyes of England, the most powerful, as she was the most interested, spectator. If the government of the United States retained this army of yellow mercenaries, then that government could continue to issue paper money, gold or silver certificates, based on it, and in no other way could arms, ammunition and food be obtained for the armies moving southward into the heart of Dixie.

Historically accurate reproduction of the costume and appearance of a California miner of the fifties. From the work of these men came the gold which played so great a part in saving the Union in the dangerous days of the Civil War.

Southern California was almost ready to secede from the Union by the year 1862. Los Angeles was a mud-built Indian village of 5,000 men, women and children; Sacramento had a population of possibly twice this number, predominately white; and San Francisco led the list of settlements in the twelve-year-old state, with 57,000 inhabitants. General Albert Sydney Johnston, who was afterward to die bravely at Shiloh, leading more than forty thousand men in the lost cause, was in command at the Presidio, overlooking the Golden Gate. He had lately crushed the Mormon Rebellion without bloodshed, and was considered one of the most competent soldiers in the army of the young republic. General Johnston was a Secessionist, but he proved his worth as a soldier and his honor as a man before he resigned from the Federal Army and joined the Confederacy.

San Francisco in particular, and California in general, controlled the world's supply of gold when the Civil War broke out. With incredible rapidity and with movements so well concealed that even to this day all the details are not known, men who favored the Confederacy organized themselves in California to seize first the military post at the Presidio; second, the mint and subtreasury in San Francisco; and, third, the harbor back of the Golden Gate, so that the great bay could be kept open as a refuge for Confederate privateers and warships, and so that through it might pass southward a steady tide of gold. Their first step was the secret organization of the "Knights of the Golden Circle," whose numbers varied from the 16,000 claimed by Asbury Harpending, of Oakland, in a book which he wrote on the subject, to the 30,000 alleged by Assemblyman Crittenden, of what is now Eldorado County, when he warned the California state legislature of existing conditions at the end of 1861. The truth of the matter is that there were probably about 7,000 men possessed of rifles, revolvers, machetes and hunting knives, in the organization, with another 5,000, or thereabout, who had no arms, but for whom arms were to be provided when the armed force had seized the arms then stored at the Presidio. One thing is certain as to this, and that is that the then Secretary of War Floyd—a strong sympathizer with the seceding states—had sent to California some 30 000 rifles and revolvers, and an abundant supply of ammunition for these small arms. This action is claimed to have been part of a nation-wide plot to seize California for the Confederacy, but, if it was, the western plotters moved too slowly, and the rifles, revolvers and ammunition, which in possession of the secessionists might have turned the tide of victory or stemmed it for several years, never fell into their hands.

Agents of the Confederacy from Richmond, New Orleans and Atlanta, flocked to Southern California, and, their numbers increased by Secessionists from the southern part of the state, moved on over the Tehachapi Mountains into San Francisco, Oakland, Sacramento, Vallejo and other centers of population. Charles R. Street, of Marysville, became the secret head of the public movement in favor of secession. Six of the southern counties of the state voted to secede from California, and set up their own state, asking admission to the Confederacy as they did so. The battle of Fort Sumter was won by the forces of the government before this could be accomplished, and the leaders of the southern counties' secession movement decided that they must carry the entire state or nothing into Confederate ranks. With this in view, they pressed to completion the organization of the "Knights of the Golden Circle," an association second only in size and importance, locally at least, to the original Ku Klux Klan which was to arise later in the war-devastated states of the South.

Unsuspected of disloyalty, Street, from his eyrie in Marysville, directed the activities of this circle, though its colonels, captains and lieutenants looked for their orders to a man known as the "General," whose name never has been revealed. It has been claimed that Harpending, who has admitted that he was a member of the organization, was the "general" in question, but this never has been proved, and the writer considers it doubtful. Surrounding this mysterious mouthpiece for the almost equally mysterious Street, however, was an inner circle of thirty proved "knights." Each of these "knights," some of whose names are known, but most of whom are not of importance, had in turn ten "captains." Each of these "captains" was to enlist 100 fighting men, so that each "knight" would have 1,000 men at his command. This form of organization probably gave rise to Assemblyman Crittenden's statement to the state legislature in 1861, that "there are 30,000 men ready to take up arms for the Confederacy in California."

With this force, the plan of the "Knights of the Golden Circle," as best recorded in various private documents extant today, was to capture first the Presidio, then Fort Point, of which General Johnston also was in command, thereafter the mint, subtreasury and port of San Francisco, and to move thence on the arsenal, located then, as now, at Benicia, about thirty-five miles northward, on an arm of San Francisco Bay. On paper, and in the meetings of the "General" with his thirty "knights," it all looked very simple, but when they called on Albert Sydney Johnston, the whole affair took on a different aspect.

"Gentlemen," said the then young soldier, "I believe in the right of every state to follow its own inclinations; I believe in the right of each of you to his own opinion and to his own action in support of that opinion —BUT, gentlemen, I am in command of the forces of the United States in this department. So long as I am in such command, and so long as there is one man able to bear arms at my orders, just that long this department shall remain in the Union. Get out!"

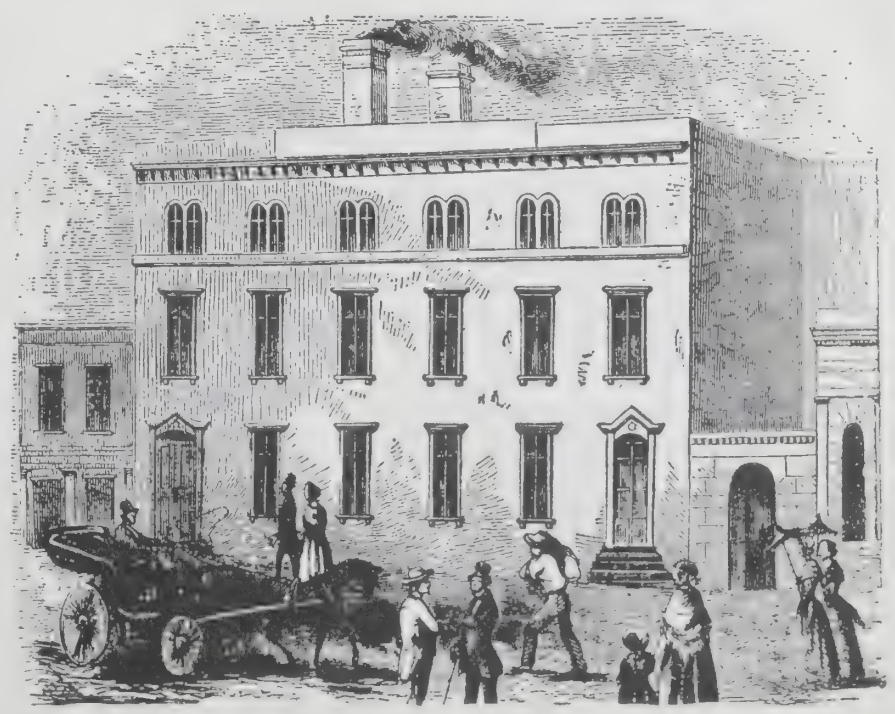
"Knights of the Golden Circle," and their mysterious "General," literally fell out of the headquarters building at Fort Point. Some time after that, General Johnston resigned, made his way southward, joined the Confederate forces and was killed just as he was beginning to show his ability as a soldier and as an officer. He was succeeded at San Francisco by General E. V. Sumner, but the actual, imminent danger to the state and to the Union was passed. Historians tell, also, that one Doane, a sheriff of San Francisco, apparently more braggart than brave, enlisted a hundred men for the purpose of "capturing" General Johnston. Posting these armed men around a house in which the general was staying in the city of San Francisco, and ordering them to shoot to kill if Johnston appeared, Doane, accompanied by a fire chief whose name has been lost, called on the military commander. They informed General Johnston that they had been mistaken by the Knights of the Golden Circle for rebel sympathizers, and so had been informed that the general was contemplating turning over the military post and the city to the Secessionists. It is said that General Johnston, single-handed, threw both of them out of his office. Whether this be true or not, their visit followed that of the Knights of the Golden Circle, so that General Johnston's attitude was not influenced by the sheriff or his hundred armed men.

With General Johnston, when he left Los Angeles to go to his death on the battlefield of Shiloh, went 150 of the best men in the secession movement in Southern California. The remainder decided to wait until the forces of the Confederacy had won a striking victory; then, with this as a club, they planned to rise in arms and beat the state into the ranks of the seceding commonwealths. But their moment of possible victory had passed. Following the fall of Fort Sumter, strong Union supporters had become active throughout the state. Union clubs were formed in every city, including Los Angeles, to which trusted troops had been moved from Fort Mojave; artillery companies had been called into San Francisco and Vallejo from Vancouver Barracks and from Oregon; and the Sixth Infantry was stationed at Benicia. The Golden Gate swung open, and through it poured the tide of gathered gold from the San Francisco Mint to the Treasury of the Union at Washington. California was safe from secession, and more than half a billion dollars—a tremendous sum in those days—was at the command of Abraham Lincoln and was used in his successful efforts to preserve this nation.

The Confederate plotters, few of whom seemed to care to risk their skins in the actual fighting, continued, however, their schemes along the California coast. The cutter *Chapman* was outfitted for sea duty and equipped with cannon through funds supplied by a party led by Ridgeley Greathouse. Their object was to prey as a privateer on bullion-laden ships leaving San Francisco Bay. A boatload of loyal police from San Francisco captured the cutter, her crew and all her equipment, the day before her owners had plotted to make their break through the Golden Gate for the open sea. Another squad of policemen broke up a carefully laid plan to capture a steamer known as the *Guadalupe of Sacramento,* in San Francisco Bay, sail her northward on that water, and capture Benicia. Some two hundred men had agreed to sail on the *Guadalupe;* but a handful of policemen armed with oak clubs, took ship and crew into the port of peace without the firing of a shot. Still another plot, hatched in Marysville, involved the cutting of telegraph lines between Sacramento, Benicia, Vallejo and San Francisco, and the capture of the Benicia arsenal. Three loyal men, armed with old-time "hoss-pistols," wrecked that plot, but that is another story.

California by this time had become aroused to the necessity of immediate action to prove the staunch loyalty of the entire state, and the more heavily populated northern part of the state sent Leland Stanford, a Unionist of great wealth, ability and influence, into the office of governor. Thereupon, Southern California's Secessionists subsided, seeing their last hope of aiding the Confederacy go glimmering with the movement of gold eastward to Washington. It was this gold which enabled the government to maintain its money and its credit, and which, in no small degree, contributed the winning factor to the northern armies in the Civil War.

California's rich fruit lands have now taken the place of the mines that from the year 1849 onward provided metallic wealth for the nation. It is not now the California miners but the fruit farmers to which the United States looks for one of its most valuable products. Gold mines become exhausted, but the fields and orange groves will give of their fruits as long as man exercises his industry in them. After all, the nation that has unlimited sources of food supply is better off than one that has to depend on the false and fluctuating standards of a monetary system.



The San Francisco Mint in 1854, when it was beginning to fill with the millions of dollars' worth of gold which were saved to the Union when the Secessionists attempted to separate California from the United States. (From a print made in 1854.)

Imagine this street without its trees—robbed of those beautiful Gothic arches to soften the rays of the glaring sun on a summer's day.

Wires strung beneath the trees do not inconvenience the "power," and neither, by this means, do the trees need to be deprived of any of their beautiful branches.

One of Man's Best Friends—The Tree

Tree Surgery Has Become a Recognized Factor in City Beautification

By FRANZ A. AUST and HAZEL HANKINSON

EVERY good healthy shade tree adds a value of $500 dollars to a lot in city or town or country. Thus the courts have decreed. But if a man were offered twice that amount for a pet tree on his lawn or on the street terrace in front of his house, would he consider it? Most likely not. The reason back of that is the same as the reason why a man in Madison, Wisconsin, offered $50 reward for the satisfaction of finding out who cut down a little blue spruce growing in front of his bungalow. It's because individuals as well as courts know that trees which have taken years to grow are priceless. They have become so vital a part of the lives of men and women and children that mere money is nothing when there's a question of looking out of the window some morning and of not finding that tree-friend "on the job."

Few will allow their trees to be dug up and sold, nor yet will many sit quietly by and allow the cave-man act to be repeated even for the sake of letting someone have the Christmas tree he craves. And yet, seldom does an owner remember that an uncomplaining tree may likewise be beset by many a robber whose name is not listed in the two-legged class. Trees must be protected against various kinds of harm during their whole lives from babyhood to old age.

Very recently, tree insurance was proposed, and the idea is being gradually wafted to tree-lovers everywhere. Thus can the value of trees, like that of buildings, be made secure against wind and tornado and lightning and ice storm. Or rather, thus can their owners be amply guarded from property loss when the elements let loose. But, unhappily, the lives and the vigor of the trees themselves cannot be made safe even by insurance.

That's why some places provide city protection for their trees. The cities of Newark and Chicago and Minneapolis and Milwaukee, for instance, as well as others, have each set aside the sum of five or six thousand dollars a year with which to hire an expert. Each expert spends all of his time upon the shade trees of the city; he organizes a system for their handling and care; he examines and diagnoses and, if necessary, he operates upon those which are "sick." Each tree expert is health officer and surgeon combined for several thousand tree specimens.

One or two states, furthermore, have granted their trees state security. Every time you drive through Massachusetts, you cannot help being impressed with the feeling that the folk of that commonwealth respect their trees. Those trees all look so well-groomed and so well-cared-for. It's a state's responsibility in Massachusetts. And it's an admirable ruling, indeed.

But, for the most part, throughout the Middle West and the East there is, as yet, little city or state protection. Less than 25 per cent of the cities which have more than 50,000 inhabitants officially look after their shade trees' health. And under 50,000 population, towns concern themselves but little. It's the owners, therefore, almost everywhere who must see to it that the trees of their dooryard and street have the chance they so justly deserve. Planting the young shade tree at the right time and under the proper conditions is half the battle. But after all, it isn't the better half. Arbor Day shouldn't end when the sun goes down on that April or May day after the soil has been packed about the roots, and the mayor's speech is over. Arbor Day ought to last all the year round when a new tree has been planted. For there are many things to be considered that it may do well. And of great importance among these are sub-irrigation, and correct staking, and pruning so that the tree will have a chance to spread naturally.

Street trees usually have the hardest time of all, even after they have grown to full size under healthy conditions. In the small place, for instance, the town "fathers" will suddenly decide that the grade of Main street should be lowered. Or quite as unexpectedly it will seem necessary to lift River street bodily to the level of the rest of the town. In either case, it's "lo! the poor tree!" For its naked roots are shamelessly exposed to all the elements and left there. Or, on the other hand, its trunk is so swathed in layers of soil that the tree is well-nigh suffocated.

It's fairyland on top; but underneath it's the "slaughter of the innocents."

In some places where the grade has been lowered, the trees have loose stone walls built around their bases so that as much of the earth as possible may be held about their roots. Then, because removing so much soil weakens the support each ought to have, guy wires are attached for anchorage, and these are made secure by being fastened to stakes in the ground, or to nearby trees.

Raising the grade of a street to any extent is fully as fatal to the health and beauty of its shade-makers as the lowering of the grade. Gravel or crushed stone filled in about the trunk before the piling up of the heavier soil is often a life-saver. Thus the tree is allowed to breathe and will not be permanently harmed. In extreme grading of this sort, it is often found necessary to build a wall about the tree so that the trunk seems to be standing in a well. And in this way all danger of smothering is avoided. Where drainage is especially good, soil can be filled in about this wall to a depth of eight or ten feet without harming the tree's health at all.

That old "thief," the concrete sidewalk or pavement, is one of the greatest enemies a tree has in city or town. Watch a tree fighting for its life against such a violent robber. It will never give up without a brave struggle. The tree pushes and shoves to secure its rights to soil and air and moisture, and the concrete is heaved and cracked on all sides. Wise owners take care of this difficulty by breaking out the concrete for a certain distance and filling the space with crushed stone. This saves the tree, and, incidentally, it saves the pavement, too, and the owner's pocketbook.

And then there are the tree-robbers on wheels. Charlie takes the car out in a hurry some morning, and in flinging around the corner of the drive he causes the hub to tear a ragged "sore" on the side of the maple tree growing there. Or one day two cars meet in an accident in front of the house, and the tree on the terrace, as well as the cars, has suffered. Either of these is a common occurrence, and usually little notice is taken of the result to the tree, for it seems to go on thriving as before. But unless something is done, like making the place clean and painting it with creosote, before long another troop of highwaymen—insect-bandits, this time—will surely happen along to make that tree their headquarters. Or other outlaws, called fungi, moisture-made, may lie there in ambush to attack their unsuspecting victim with decay. And the tree is doomed.

Did you ever notice a broken branch hanging desperately to its mother tree and swinging in the breeze after a windstorm? Every sway breaks a little more of the bark and strips it down the side. The tree's owner knows that stalwart member is worth a thousand dollars to his property, but he is too busy to relieve its suffering. Maybe he doesn't know that delay in amputating the tree's limb and disinfecting the spot is fully as dangerous as not taking proper and instant care of a person's injured arm or leg. Lightning, that tricky sharp-tongued dweller in the sky, will rob a tree unmercifully in a number of ways. One tree recently had all its bark stripped off. If this misfortune had been taken care of by nailing the bark back into place before the raindrops accompanying the storm had dried, the tree could have been saved. But the accident was not noticed for several days, and then nothing could be done to keep the wound from proving fatal. For the tree had been completely girdled.

One of the favorite "stunts" which lightning performs is to slide down the entire length of a tree, ripping as it goes. Those who properly care for trees cut back the bark smoothly and paint the place with disinfectant so that vigor and growth are not lost, and for best results this is always done soon after the accident happens. On the other hand, if lightning shoots down one side of a

tree and merely loosens the bark, nailing the bark into place and painting any open wounds will usually prove to be the tree's salvation.

Scarcely does a winter pass in the northern section of the United States without one or more ice storms. Gorgeous are all the trees and bushes when clothed in silvery uniforms which shine in the sun. With every breeze the branches clank musically. But that very music is the "swan song" for many a tree. For as night comes on, and the air grows colder, twigs and branches begin to pop and snap as though all the trees were at rifle practice. Later the boom of the real cannonading begins, and the creaking groans of Nature's injured. Thus the contest with ice and wind rages on until melting takes place. Then, alas! you know that the trees have lost the battle, for the trees themselves and the ground beneath the trees are strewn with awful carnage.

And unless a man is particularly on the lookout for their welfare, he will neglect these wounded tree-friends at just the time when "first aid" is most needed. It is not the most pleasant "job" in the world to climb a ladder on a cold winter's day with saw and block-and-tackle in hand. And yet that is just what the true tree surgeon does so that every fracture and split may be examined, and that the very best treatment may be applied. Then, before growth starts in the spring, he cuts the stubs neatly and paints them. And even unto the second and third years after the wounds were made he keeps close watch that the battle-scarred veterans of the ice-war may be fully restored to health.

Even telephone and telegraph lines and electric power systems with their yards of wire can steal the beauty from the tree tops. Every property owner has a legal right to say what shall be done to those trees which are growing on his lawn or on the street terrace or along the country road beside his farm. But very often in town and village and in the country he is willing to sell that right for a few dollars. Hence the lineman cuts and slashes to his heart's content that the "power" may be convenienced. And the result is many a beheaded tree.

Above—The owner of the land upon which this tree is growing has a legal right to prevent this "robbery." Below—When the magnificence of the ice storm has passed, the trees display the terrible ravages upon their health and beauty.

Where wires pass through a cable, much of the difficulty is avoided, for fifty or more wires can be threaded through one passage. Where poles are placed close to a tree, and the pruning is properly done, the result is also satisfactory, for thus the wires cannot vibrate so much and cause damage to the branches. The use of a projecting cross-arm is also good, for in this way the wires are carried past the tree instead of through the tree tops. Another good plan in helping to give the trees their rights is the zig zaging of the wires across the street between trees. This can be done especially well where trees are tall. And probably, aside from the placing of wires underground, the most nearly ideal arrangement is the one in which the poles are considerably higher or lower than the trees so that the wires can pass either over or under without coming in contact with the branches at all.

With the passing of years, the shade-tree-friends of lawn and terrace and country road will surely increase in value. Appreciation of them will become higher as natural woods and forests disappear. More and more, the value of home grounds and of new lots will be estimated higher or lower according to whether they are "treed" or "treeless." Wise, therefore, is the man who saves and protects such growing property, not only from the hands of those who would carry it bodily away, but from all "brigands" ready to steal its life and health. Such a man is storing up future satisfaction for himself and for his children. And he is likewise fostering the spirit of the preservation of America's outdoor beauty. Once this beauty is gone it can never be restored except at the expenditure of much labor, time and money.

Cabal May Govern World's Gold

Concluded from page 2

especially when that design is announced by the one who does the designing.

1868

Mr. Paul Warburg was born in Hamburg, Germany.

1893

Arrived in America for the first time.

1895

Married Nina J. Loeb, daughter of Solomon Loeb of the banking firm of Kuhn, Loeb & Co., of New York. Mr. Loeb's residence was given as Frankfort-am-Main and New York.

1898

In this year, the great Jewish migration from Central and Slavonic Europe began to reach its height and continued until the opening of the great war. Most of these individuals reached this country on ships of the North German Lloyd and Hamburg-American Lines. Max Warburg directed the general policies of these two steamship lines through control by his banking house. At one time, the passage rate from points in the interior of Europe to the New York docks reached the low point of $28.50 an adult.

1902

Mr. Paul Warburg migrates to America. Before a subcommittee of the United States Senate in 1914: "I had no definite intentions then, because some of the reasons that brought me over here were family reasons. . . . That had a good deal to do with my first coming here; I was not sure at all that I would stay here when I came."

1906

Mr. Warburg began in this year to work upon monetary reform. He informed the committee, "I was not here three weeks before I was trying to explain to myself the roots of the evil" (i. e., monetary evil).

It was about this time that commercial acceptances began to appear among banks in New York for rediscount as distinguished from "three-name paper." Trade acceptances are a purely Germanic type of credit operation which transforms immobile promissory notes into bills of exchange, functioning in a limited capacity as a medium of exchange and to that extent acting as currency. Mr. Warburg was largely instrumental in bringing about this change. Incidentally, but of much greater importance, there went with it *the substitution of securities for character as collateral for loans.* International acceptances appeared later.

1907

Mr. Warburg published in this year, "Defects and Needs of Our Banking System." Later, he wrote and published, "A Plan for a Modified Central Bank," and "A United Reserve Bank of the United States" (1910).

1908

Mr. Warburg took out his first citizenship papers.

1911

Mr. Warburg took out his final citizenship papers.

Arthur von Gwinner, president of the Deutsche Bank of Berlin, brother-in-law of the Brothers Speyer, bankers of London and New York, made a speech at a dinner given at the American Embassy at Berlin in which he "advised the United States to establish a central bank modeled on the lines of the Deutsche Bank."

1912

Secret meeting of bankers at Jekyl Island, Georgia, which was called at the instance of Senator Aldrich. Mr. Paul Warburg was present and did most of the work. The meeting resulted in the drafting of the Federal Reserve Act. The purpose of the meeting was to "evolve and compile a scientific currency system for the United States, a system that would embody all that was best in Europe." So perfectly was this done that some of the phraseology of the Reichsbank charter is to be found in the Federal Reserve Act, just as whole sentences in our land bank laws are taken from the land bank laws of Germany. The relationships of the persons at this meeting were such that afterward Professor Seligman, of Columbia University, said: "It may be stated without fear of contradiction that in its fundamental features the Federal Reserve Act is the work of Mr. Warburg more than of any other man in this country." It may also be stated that the propaganda which paved the way for the Federal Reserve Act was the work of Mr. Warburg and the group with which he is associated.

1912-1913

The so-called "Pujo Investigation into the Money Bund," was preceded by two years of active agitative propaganda by the Hearst papers against American bankers and capitalists. It is thought by many that this investigation was staged for the purpose of getting information out of the offices of J. P. Morgan and Company for the benefit of Wilhelmstrasse which could not be secured in any other way. Mr. Samuel Untermeyer was the examiner by whom it was attempted to elicit the information. At that time, Mr. Jacob Schiff, of the firm of Kuhn, Loeb & Co., was called to the witness stand but his testimony was perfunctory. The committee announced its intention of calling Mr. Warburg but he was never examined.

Passage and approval of the Federal Reserve Act, establishment of a central reserve bank, the culminating event of Mr. Warburg's migration to this country.

1914

In passing the Federal Reserve Act, Congress legalized the principle of ownership of bank stock by banks. Ownership of industrial stocks by banks is the next step in the program of the Jewish bankers who are endeavoring to impose their system of financial overlordship on this country.

Mr. Warburg was appointed head of the Federal Reserve Board by President Wilson, the Senate confirming after investigation. It is safe to say that under the Wilson Administration no one was appointed to this board without the approval of Mr. Warburg and that he did at that time and has since absolutely dominated the policies of the board.

To the Senate Committee, Mr. Warburg said: "That a thing which had a great deal of influence on my making up my mind to remain in this country, and work here, and become a part and parcel of this country, was that monetary reform work, *for I felt I had a distinct duty to perform here; and I thought I could do that;* and in fact I have been working on it since 1906 or 1907."

1918

Mr. Warburg declined a renomination to the Federal Reserve Board tendered by President Wilson on the ground that his German connections would make such an acceptance a subject of criticism.

1923

Mr. Otto H. Kahn, Mr. Warburg's partner in the banking firm of Kuhn, Loeb & Co., informs the American public that there is no such a thing as an international banker.

It is interesting to note at this juncture that the movement for the establishment of Federal Reserve systems in South American countries has been so widespread and successful that already there is talk of a "federated South American reserve system" of banks, a movement largely engineered through Jewish influence

Juries, Jurors and Jumping Jury Service

Citizens Shrink From the Task of Passing Judgment on Their Fellows

By A. RICHARD DI NATALAE

ON THE steps of an important court building in the city of New York a group of four jurors called to serve during the month of October—four men who an hour before did not know of the existence of one another—were spiritedly discussing a subject, if not a problem, which was obviously general among them. They intimately confessed that they did not want to serve as jurors. Jury serving was regarded as a sacrificial duty which the "law should not impose upon busy men to whom time is money," or for some such reason. The underlying temptation was to escape service if possible—something that was, at this juncture, regarded as improbable. Somehow, the impression obtained that to be a juror is tantamount to being a nonentity, on the supposition that the citizen lacked importance or influence in "getting off."

Jumping jury service is not a novelty, however, even though the subject has not received the attention it deserves in these days of complex legal systems, but it remained for one of the aforementioned quartet to make a declaration, in another group half an hour or so later, which reveals an inconsistency of American citizenship.

The later group was listening to the details of a recent case in which a "bone-headed jury" rendered the verdict in a manner not satisfactory to the speaker.

"What do you think of such a verdict? Is that justice?"

"Well, what can you expect, considering the grade of intelligence of the average jury? The average jury has a certain amount of common sense, but to trust life or property to the keeping of the average jury is dangerous. I'd hate to trust anything of mine to them!" This was the opinion of a most substantial citizen.

"You said it."

Thus we come at once to the crux of the whole problem.

If men belonging to that higher realm of prosperity that is associated with relatively keener intelligence persist in jury jumping or in serving half-heartedly and as seldom as possible, who remains in the ranks of available jurors?

Three Dollars a Day

IF MEN of means and ability and even leisure solidly align themselves against jury service, considering the jump either as a joke or a sport, it is evident that juries must consist of less able individuals. Laws and regulations practically exempt certain classes of citizens—I may say the most desirable classes from the standpoint of mental efficiency and moral balance—so that jury panels at the very outset lack a fair proportion of the best community minds, which leaves a residuum that may be good to fair in exceptional circumstances and fair to middling in most cases.

These two approximate degrees are not based solely upon my own observations in the course of privileged contact in courts and court business, civil and criminal, but actually represents the composite thought of most judges and prosecuting attorneys and private lawyers.

Conversely, the object which the courts of our land have always sought, in view of the limited and shrinkable group of available jurors, has been to prevent the formation of a professional juror class, especially in the larger centers of population. The most direct method has been that of keeping at a minimum the nominal per diem compensation of jurors, although plans have often been laid for increasing these fees.

Three dollars a day for every day of service or court appearance is the maximum, and many men refuse to serve, or endeavor to refuse, because they cannot afford, they say, to lose a day's time for three dollars, half of which goes for lunch and a good part of the remainder for transportation. Yet, although sixty dollars a month, calculated on the basis of twenty effective court days, is not a sum to brag about these times as an item of income for any adult, it has been found by experience that any city affords countless individuals who would be glad to attach themselves to a regular jury pay roll. It is taken for granted that higher jury fees, plus the inevitable *sub rosa* lubrication afforded by ward politics, would pave the way for a limited class of privileged talesmen.

Conspicuously prominent and solid citizens of any community are rarely found doing jury duty. In most cases, they are never called. In New York, for example, prominent citizens are quite regularly identified with the various grand juries but hardly ever in a trial jury.

Obtaining Exemption

CONFLICTING is the attitude, likewise, of the big employers and corporations. Among these will be found many, especially those engaged in public service, that manage to obtain exemption from jury duty of their employes, but there are just as many that make jury service compulsory, and there are records of dismissal from employment for an individual to seek being excused from this civic duty with an untruth.

On a jury in which I served, the economic angle of an employe was made quite plain.

"I work a month inside and a month outside," he said. "My store work is on straight salary; my outside work is salary and commission. I got called at the right time as I don't lose anything this month. I am here on company's time. If it had been my month out I would have asked the judge to put me off for a month."

Salaried men, especially those in the lower industrial categories, regard jury service as a little boon if they can put it across in their employer's time. One man told me that he had been called regularly for many years, and that he would have had no objection to serving as juror, but as soon as the notice to appear was shown to his boss, the latter took it and that was the end of it. How the boss explained it to court officials he didn't know.

Professionally I belong to one of the exempt classes. For many years I was not called. My first notice reached me two years ago and three times, owing to business exigencies, I was unable to serve, due explanation to the official in charge having been enough. Late in September, however, I received a notice, rubber-stamped "Month selected," which bade me appear before a certain court on the first day of October. Five or six men asked to be, and were, excused by the judge. Three were unsuccessful. Four were excused before the end of the two-week period. The twenty-four of us who actually served, as two rotating juries, actually served six court days out of ten, the other four merely putting in our appearance and responding to roll call.

Indeterminate Citizenship

SIX days out of two years—and six days which each juror was free to select himself—is not very much, yet nearly every man had a kick to register about it. Not only kicks, but much apathy.

How jury service is regarded was proved to me within the next few hours. I mentioned the matter to my grocer.

"So they got you, eh?" He laughed. "Didn't you know how to get off?"

"Do you?" I retorted.

"Sure. It's all in knowing how. I haven't served for ten years."

The next day my telephone bell rang. It was a friend who, in town for a day, wanted me to join him as he visited.

"Impossible, I am on the jury for two weeks."

"On the jury?" he repeated, with an inflection of disbelief in his voice, as though I had told him I was in jail. "I thought you had influence!"

The grocer is another of those numerous citizens whose attitude in this respect is anomalous, nay, incomprehensible, for he can well afford the luxury of serving. A few days before that a runaway horse attached to a delivery wagon struck the rear fender on his parked machine and did damage that cost sixty or seventy dollars to repair, fifty dollars of which his insurance would not cover through contractual exemption. He was roundly abusing insurance charges and the courts' attitude against the automobilist.

"It costs me ten dollars a day insurance because I am a business man and if my car tomorrow figures in an accident to a kid stealing a ride and losing his balance any New York jury would soak me for twenty thousand without batting an eye. You can't get justice out of a jury any more, especially if you own a car."

"Would you soak a car owner if you were on the jury?" I asked.

"But I don't want to serve. What's the use?"

Thus if juries today fail to be as just as they might, it is due to the fact that responsible citizens are absentees. Lacking representation in the courts they have enabled the average box to be filled with men who collectively represent an indeterminate and often inadequate citizenship.

The Privilege of Disagreeing

IN THE smaller towns, especially where the foreign element is negligible, or where it has not yet established an *entente cordiale* with ward politicians, this phase is of little interest, but in the larger and wealthier centers of population a retarding factor is the foreign-born juror who lacks fluent familiarity with the English language, but who is called to serve because he is a legal citizen of the United States. It often happens that a native American, even versed in law and familiar with national habits and customs, finds it difficult to understand fully and clearly the ins and outs of a case. Under the circumstances the naturalized but inadequate juror may vote with the majority through sheer influence of majority thought or, as happened on our jury, may elect, through that peculiar stubbornness born of his ancestry, to hold out indefinitely as one against eleven, even after admitting that he knew nothing about the questions involved in the trial, was not sure of what the judge charged as the law, but that because the judge said that he had the right to disbelieve he was going to "disbelieve even if it's necessary to stay in this room a week." He had neither facts nor logic on his side; he admitted ignorance and was going to avail himself of the privilege to disagree because "that's the way things ought to be even if they ain't."

It might prove impracticable or unfeasible to make this discrimination, but for the sake of expediency there should be elimination in that ancient process known as the "challenge." It is true that the challenging process has been overdone, especially in cases where costs and time are no object, until the process of elimination leaves a residuum in the jury box that cannot always be bragged about, that serves certain ends even if it does not serve justice, but the alien-born, pidgin-English juror has no place in an American jury box to pass judgment upon matters about which he is naturally and linguistically ignorant.

Nine-three, ten-two or eleven-one disagreements are not rare in our court annals, but as often these disagreements make way for retrial, with consequent expense to the community, it is just as well to guard them from needless disagreements in which law or burden of proof does not figure. If intelligent native Americans are eliminated upon sheer technicalities that often are nonsensical, it is just as possible to keep from the jury box individuals who are unable to maintain the normal American pace.

A peculiar human trait related to jurors is that which makes criminal cases more attractive than civil cases, once a juror realizes that he must serve. On the whole, he regards criminal cases as having more color, snap, interest, which he comprises, sometimes, in the single word—life. A juror who had been kicking about serving in a lower court where small civil suits are tried admitted that he would have liked serving in the next building—where a celebrated divorce scandal was about to be aired for the second time. Naturally, the lesser criminal cases are not so attractive as the major ones, either measured in terms of scandal or of prominence of parties.

Everything else being equal, in my experience I have found that civil cases are as interesting as criminal cases. When they are actions based upon modern business problems, and are well handled by expeditious attorneys, they transcend in interest because they beget new and original matter, as against the universe-old morbidity which pervades crime.

A New Education

A JUROR gave me an explanation of this trait some years ago. Said he:

"I'll tell you why I enjoy trials in this criminal court. It's the only time I have heard of the rougher side of life in direct terms. All the rest has been hearsay or newspaper stuff. I am nearly fifty years old, was never arrested except once because I broke some street ordinance; I have had my nose on the grindstone until I got from it enough money to raise a family, and I am a deacon in the church. I have heard enough scandal—but acting as an officer of the court for a time and having to attack seriously and gravely problems which are brought to my attention directly by those implicated therein—well, it's a new education. It is merely proving to me how little some of us know of what's going on in the world."

Naturally, there is little "pep" in the routine testimony or cross examination in a case involving a debt of a few hundred dollars. These cases are so much alike that judges have the habit of closing their eyes as if taking a nap and the juries become fidgety. Some cases consume days. Many a judge has asserted that the case before the court should never have reached the law—and there is much truth in that. Thus there is food for thought in the fact of how these picayune cases ever get to court. I suspect that lawyers are on the whole responsible for this excess traffic, and every statement I have heard a court make seems to bear out my impression. In a few weeks in one court I heard a judge repeatedly say of the cases before him that they were a needless drain upon the county and the taxpayers' money.

Another, and not unimportant phase, which one may easily identify by perusing the daily court record of any newspaper, is the growing percentage of foreign or alien cases in American courts, with the collateral array of like counsel. Now it is no secret that in many big cities, especially of the East, foreign-language counsel has done land office business by specializing upon the grievances of its brethren. The right to call upon the law for the adjustment of disputes is inalienable and no one thinks, of course, of curtailing it in any way, but, on the other hand, there are growing evidences that our courts have become flooded with cases that are not cases at all, and that see the light of a court room through the activity of pugnacious lawyers who must make cases that they may thrive.

That that is so is indubitable, otherwise no judge, from his bench, would ever venture the assertion that cases before him never should have reached the court.

Perhaps all cases involving property under ten thousand dollars should be arbitrated before a competent commission, whose members would have the right to question witnesses and attorneys as the trial proceeded.

An Arbitration Commission

IT HAPPENS too often that a juror would like to clear his mind over some point, but just too often he fails to do so, hoping that as the case progresses the doubt will be cleared by some chance evidence. Multiply that by twelve and one may surmise the chances of doubt—and the jury room does not settle them at all. Nor would it be feasible for jurors to interrupt the progress of the trial to submit questions to the court. The arbitration commission plan would eliminate this defect.

A Federal judge to whom I suggested the idea some time ago rather leaned toward it, but feared that it would prove unfeasible from the personnel standpoint. Eventually it was assumed that an arbitration commission, with a permanent chairman who would be a judge in the full sense of the word, and four commissioners (jurors) to be selected as jurors are now selected, ought to fill the bill.

There is no doubt that sooner or later Congress and the respective legislatures will be obliged to simplify our archaic court system, especially now that citizens seem more than ever disinclined for jury duty.

James Wood and the American Bible Society

Why the Bible Is the "Best Seller" in the World; Its Influence in the Making of Great Nations

By JEAN PIPER

WHEN one goes to interview a man reputed to be 84 years old, and finds him just returning from a tramp with his foreman over his 400-acre farm, and watches him stride briskly across his lawn to greet you, nattily attired in soft English tweeds, with low-cut tan oxfords and gray felt hat, a glimpse of the family Bible on birth dates would be most reassuring. The wonder grew, when James Wood, president of the American Bible Society, lifted his hat and revealed a handsome, iron-gray head, and gripped your fingers until they tingled.

Perhaps in all Westchester County, New York, there is no place that spells home and the world, all in one breath, as does the rough-hewn stone house on top of a high hill on the Old Road, where James Wood has lived through his 84 years, and his father before him. The Wood family came from Halifax and England, and for 120 years the estate has been in their name. Only one deed of the land stands between them and the Mohican Indians.

It is a mellow house, redolent with memories and filled with the atmosphere of much good living, and rich in treasures from Europe, Western Asia and Africa. And James Wood, sitting so comfortably there by the open fireplace, talking so fluently and earnestly about his work in the American Bible Society, gave the listener a vision of Longfellow. He does resemble Longfellow—his intent yet kindly expression, the broad brow with the wide-set blue eyes, the heavy mass of white hair, the square shoulders, and only the close-cut white beard breaking the continuity of the picture.

Scarcely a week before it had been a rare privilege to watch Mr. Wood acting in the capacity of clerk of the 229th Yearly Meeting of the Society of Friends, tactfully heal the schism of 100 years that had kept apart the two branches of Quakerism, the Hicksites and the Orthodox, and leading them in a joint meeting, in which, unexpectedly, they welded into one body in their expression on two of the national questions of the day. James Wood has that extremely rare gift of knowing when he has said just enough, and following it up with a vigilant silence. This characteristic has made him famous as a leader of men.

"There are four great reasons why the Bible is the best selling book in the world," said Mr. Wood, settling himself in the big chair. "First to satisfy an innate longing. People want something outside themselves, and believe it can be found in the Bible. A step higher are those who want to confirm doctrinal beliefs, and this is not necessarily through a controversial impetus; and, last, that class highest up and most in number, those who want to know what is in the Bible that has made the people who read it superior to other people. This last is the most tremendous factor in the sale of the Bible. For the second time in its 108 years of existence, the American Bible Society has issued more than 7 000 000 copies. The exact number issued last year was 7,101,289.

"Queen Victoria struck at the heart of the whole matter forty years ago," he continued, "when Lei Hung Chang, Chinese ambassador of the old Manchu Dynasty came to her saying:

"'Your Majesty, the Emperor of China has sent me to inquire of you what has made your nation so great?'

"And the Queen replied, laying her hand on the Bible, 'This Book.'"

It is recognized that English-speaking people rule the world, and everybody else wants to know the reason why. It was a known fact, that in the ten years before the World War, the English-speaking people increased 216 per cent while no other language reached a 100 per cent increase. And forty years before Queen Victoria had let Lei Hung Chang into the secret. Today the Republic of China has more Bibles published and circulated in its territory than any other country in the world. Last year 2,500,000 volumes were distributed in China, and twice as many could have been circulated if the earthquake had not cut off the supply. It is their keen interest in Western ideas.

"Do you think people buy the Bible just for literary purposes?" Mr. Wood was asked, and he replied:

"Very few. Only the highly educated are attracted because of its literary merit. The rest of the world get it because they are looking for something they cannot find, and feel it is found in the Bible."

Here Mr. Wood paused, and with that clarity and system characteristic of him outlined briefly how the work of the printing and distribution of the Bible is carried on.

"There are two great Bible societies in the world," he said—"the American Bible Society at Astor Place, New York City, which was established in 1816, and the British and Foreign Bible Society, 146 Victoria street, London, established in 1808. The Bible is the best-selling book in the world, and this year after year. Last year 30,000,000 copies were sold throughout the world, and while in eight years Harold Bell Wright's books, the second-best sellers, have only mounted to 10,000 000 sales, the Bible has risen to 240,000 000 copies. Last year the American Bible Society sold 7,101,289 alone, 2,901.937 of which were sold in the United States and 18,334 in our island possessions."

The translation of the Bible surpasses that of any other work. It has been translated into 770 different languages and dialects, and, according to the reference librarian of the New York City Library, Bunyan's "Pilgrim's Progress" ranks next. It has only been translated into 107 languages and dialects, making the Bible farther reaching by seven times. The American Bible Society has made 137 of these translations of the Bible, Mr. Wood said.

The subject of the translations brought interesting revelations. Mr. Wood suggested a stroll around the lawn so that I might enjoy its beauty while hearing about the work of the society. From the front veranda a wide expanse of undulating valleys stretched, broken at last by five interlocking mountains forty miles away. At the foot of the hill on which the Wood home stood was a little lake. Mr. Wood sat quietly looking out across this beautiful vista, and later I learned that the lake had been made in memory of a daughter who had died at sea.

Resuming our stroll through the spacious lawn, he paused for a moment under a Spanish arch, half-covered with woodbine, that rose at the rear of the house, and sounded a bell hanging there. It bears the inscription, "Cast 1623, Seville, Spain"; and was the gift to James Wood from a sea captain, who recovered it from the Juan Baptiste Monastery. Its beautiful tone is attributed to the fact that it is made of one-quarter silver, the melted offerings of visitors to the monastery.

At the curve of the driveway he came to another halt and pointed to a column from the Giant's Causeway that once joined Ireland and Scotland, and now lies a hidden wonder at the bottom of the sea. Turning to the rhododendrons in full bloom that, tall as lilac trees, stood quietly in front of their background of pines, he said, "I brought those from England forty-three years ago."

Resuming the subject of the American Bible Society and its world-wide work, Mr. Wood said:

"It is very interesting to note that China has thirty-nine dialects to struggle with, while her neighbor, Japan, on her little volcanic island, has a universal language and no dialects whatever; and the Japanese are learning English more rapidly than any other people in the world.

(C) Marceau, N. Y.
JAMES WOOD.

The circulation of the Bible last year in Japan just doubled that of the year before.

"The earthquake wrought great havoc in the work of the American Bible Society, for, prior to the disaster, the city of Tokio printed more volumes of the Bible than any other city in the world, not excepting New York and London. In a moment the Fukuin Printing Company, its general manager, Mr. Muraoka, and sixty of his employes, were destroyed. The material loss amounted to $289.803, but the loss of time that will be necessary to rehabilitate the work cannot be estimated. The Fukuin Printing Company was an institution in the Far East. All the society's plates for its editions of Japanese Scriptures, certain of its Chinese Scriptures, and most of its Siamese Scriptures were simply a mass of molten copper. The Philippines suffered most, for the plates for the Scriptures in twelve different languages of the islands were utterly destroyed."

The unthinking person scarcely realizes the great service that Bible societies have rendered in keeping the Bible out of commercialism. Not long ago we read in a South American newspaper an advertisement of a Bible for $68, Mr. Wood said.

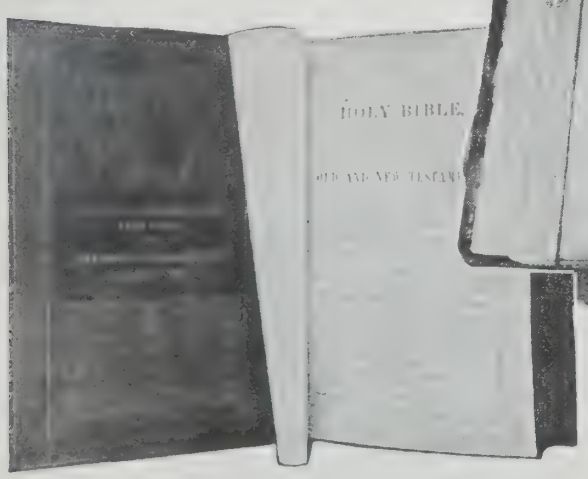
Bibles were once so costly that they were chained to pillars in the churches. In the reign of Edward I, a Bible cost $150. Wages then averaged 3 cents a day. Six hundred years later, in the reign of Edward VII, Bibles sold for 25 cents. Between these two dates the art of printing had been invented. The first book ever printed on Gutenberg's epoch-making press was the Bible. More than 600,000,000 copies have been printed since Gutenberg's day; and the story of this wonderful achievement is largely the story of the work of Bible societies, created especially for the purpose of "encouraging the circulation of the Holy Scriptures without note or comment."

Of all the countries in the world Russia is the only one who has any closed ports to the Bible. Unhappily, with the extension of the Bolshevik régime into the Caucasus republics, the prohibition on the circulation of the Scriptures has been very rigorously enforced.

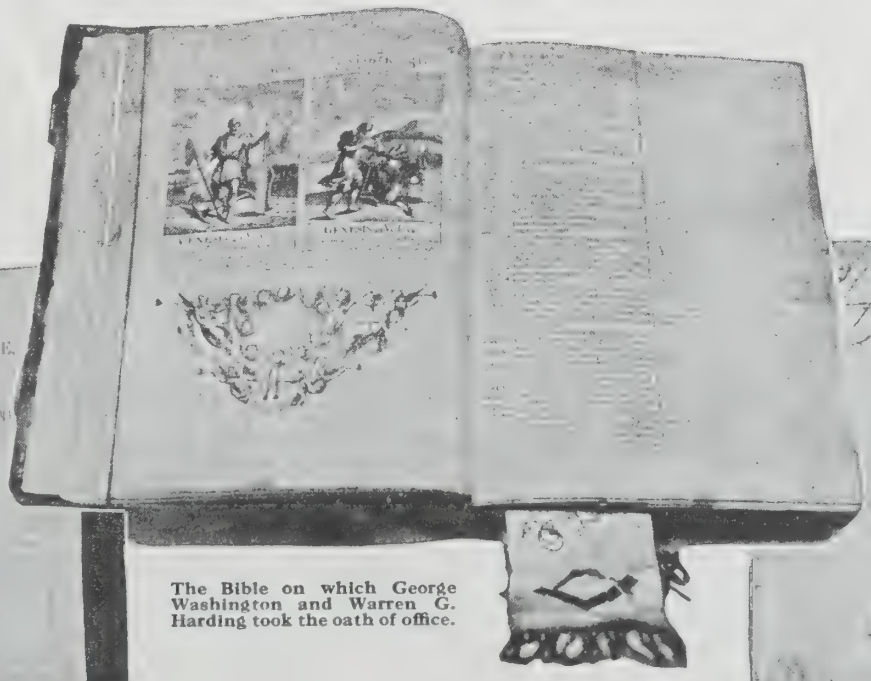
Referring to the language problem in the United States, Mr. Wood said:

"It takes thirty-nine languages to supply

(Concluded on page 14)



The Bible which President Roosevelt "always kept at his hand on the reading stand in the north room at Sagamore Hill."



The Bible on which George Washington and Warren G. Harding took the oath of office.

Lincoln's Bible.

James Wood and the American Bible Society

Concluded from page 13

the needs of the City of New York, and just as many to supply the city of Chicago, which goes to show the foreign language population of these two cities is about the same.

"Until a year ago all the printing and publishing of the Bible in the English language by the American Bible Society was done at its headquarters, Astor Place and 8th avenue, New York City; but it was found that it could be done better and more cheaply in the commercial printing houses. Contracts of 1,000,000 or more copies of the Bible are let to large concerns, many of which are out in Indiana, where there are fewer trade unions to interrupt the progress of the work than here in the East."

Cairo, Mr. Wood told me, is the great printing center for Bibles in the language of Egypt, Arabia and Syria. In Syria great interest has been awakened in the last year through the opening of the new American Printing Press Company in Beirut. Tokio is the center for Japanese, Siamese, Korean and the Philippine languages. The rest of Asia, outside of China, is supplied by the British and Foreign Bible Society, and the printing is done in England, where you can get a better Bible for the money than any other place in the world.

"The American Bible Society labors under great difficulties because it is not financed so well as the British and Foreign Bible Society," continued Mr. Wood. "It has large trust funds, the income of which is used to enable it to sell Bibles below cost, which it does in all European countries. The American Bible Society is able to sell only at cost, except when it gives them away outright, and consequently the British and Foreign Bible Society constantly undersells the society to its great embarrassment, because people find they can buy better Bibles for less money in England and the Continent than in America.

The Need Is Universal

"THE American Bible Society," explained Mr. Wood, "gets its money from three great sources, from the incomes of bequests, of which they have some $3,000,000; from Protestant churches, who include them on their yearly budget, the largest amount from this source coming from the Methodist Episcopal church; gifts of private individuals; from persons who send their money to the society on the annuity plan, receiving a higher percentage of interest during their life than could possibly be got from any other quarter, and leaving their money to be used for the work of the society, when they have finished with it; and from the state and country Bible societies in the United States, the largest of these being in Massachusetts."

In the three methods of distributing the Bible it is the colporteur and the missionary who get the adventures and the heart throbs of human interest, Mr. Wood said. The commercial distributor gets little more than the amount of stock on hand and the number of sales. These colporteurs, who travel all over the country, sometimes in a motor car, more often on foot with only a pack of Bibles on their backs, know the romance of Bible selling, how the Eskimo sits in his ice hut in the southern quarter of the Arctic Circle, and by the light of his sperm candle reads the Bible in his own tongue; of the great ports of the world, where he meets the incoming vessels and sells aboard. And James Wood, whose work in the American Bible Society extends farther back than the thirteen years he has served as its president, sighed as he looked out across the green valleys, and one knew he missed that human contact with those who read the Bible he has worked so hard to send out. It is these same colporteurs who set the wheels speeding up in the great central office, when they come telling of other folks who want a Bible, who speak a strange tongue. The work of translating never ceases.

At present the American Bible Society is at work translating the Bible into the Indian languages of South America; and have just completed one very important translation into the Cachewa language. The Cachewas are descendants of the Incas, who at the Spanish invasion retreated high up into the Andes Mountains, and have lived there for generations unaffected by the civilization of their dispossessors. Sometimes, Mr. Wood declared, it takes as many as three years to complete a translation. All this work must precede printing and final distribution.

A Wonderful Bible

SITTING down beside some huge rocks of pink quartz, dug from a quarry over the hill, Mr. Wood told of the days when he became president of the society.

"It was in November, 1911; and I served as acting president until four years ago. When I became 80 years old," he said thoughtfully, "I felt some one younger should take complete charge of the work. Not that I felt incapable of doing it, but I wanted to establish a precedent that when a man reached the age of 80 he should retire. When I asked to be relieved," he said smiling, "I was made president emeritus, and, incidentally," he continued, nodding his head, "I have more to do than I had before." It is a common sight in Mt. Kisco, New York, to see James Wood, three or four times a week, unaccompanied, boarding the train for New York City. When the time for my train came the day I interviewed him, he hitched up a little brown horse to a two-seated carriage and drove me to town.

"The most wonderful Bible, perhaps," he said, "is the one known as 'The Silver Bible,' in the University of Upsala, Stockholm. It belongs to the very earliest manuscripts and is hand-printed in silver letters on vellum. In those days Bibles were so rare, in fact books of any kind, that they were chained to big pulpits in cathedrals and private libraries, and used only by professional readers. Today, the Bible is the cheapest book in the world, and can be bought for 43 cents, a single Gospel in a neat volume for a penny.

"I have every reason to believe," he said, as we descended the solid-oak stairs of one of the most remarkable private museums I have ever seen, that held everything from a stuffed wild cat, with a furry brush atop each ear, to Brazilian humming birds of exquisite beauty, "that the Bible used by Abraham Lincoln is one of the original 20,000 volumes imported from Holland, when the colonies were at war with England. Of course, you know we supply all the Bibles for the White House and Congress.

"And, by the way," he added in closing, "the world circulation of the Bible society increased last year 75 per cent; and the strange part of it is that the American Bible Society did not have any more money than it had the year before to promote it. The desire for the Bible was so strong that more books were sold and fewer given away. The society always gives Bibles away, if people cannot afford to pay, but it had rather sell them, not because of the money, for they are always sold at cost, but because a thing bought and paid for has greater value to the possessor."

The French Peace Prize Winner

THE newspapers have widely reported that a watchman or janitor was the winner in France of the first prize for a Peace Plan in a contest along the lines of the Bok contest. This would place the janitor in a new rôle as peacemaker, contrary to the experience of all dwellers in apartment houses. While it is a pity to spoil a good story, the truth, as pointed out by Professor Marcel Clavel, in the University of Michigan *Daily* (October 12, 1924), is that the winner, M. Fernand Maurette, is professor of economic geography at the École des Hautes Études Commerciales and assistant secretary of the École Normale Superieur. This is one of the most famous French institutions of higher learning, comparable to Harvard or Michigan rather than to an American normal school. The plan is not the first venture into print of M. Maurette as there are a dozen or more books to his credit. The international distinction of the winner is attested by his recent appointment as head of the scientific department of the International Bureau of Labor at Geneva.

The error arose from the fact that the French term "surveillant," which can be translated "watchman," refers rather to duties connected with watching over examinations, academic supervision, or charge, and not to the duties of a night watchman or janitor.

It is to be hoped that nothing in this note will discourage ambitious janitors from assuming the pleasant and possibly profitable rôle of peacemakers whether on a large or on a small scale.

A Lighthouse Summer Home

By J. C. GILBERT

SINCE the ancient Lybians and Cushites of Lower Egypt hung a brazier of burning fuel from a pole projecting over the sea cliffs as a warning to mariners of dangerous rocks, the lighthouse has been in the process of evolution, until now we have the modern steel tower with its flashing lights and trained operator. The old-type lighthouses have been abandoned to the elements and for the most part have disintegrated into the sea. Occasionally the old towers are put on the auction block and sold for what the government can get. On Nauset bluffs, on the picturesque ocean side of East-

ham, Cape Cod, the government recently erected a modern beacon with a triple flash, mounted on a forty-five-foot steel tower. This new tower takes the place of three old-style lighthouses which were sold at auction. Two of the towers were bought by Mrs. H. M. Cummings, of Attleboro, Massachusetts, for three dollars and were moved a distance of half a mile outside the government reservation and placed on the Cummings property.

A living room thirty-eight feet long and twenty-four feet wide was built between the towers. A large stone fireplace was built in the center and the kitchen and bathroom were built to the back. There are thirteen windows in the living room and three French doors. At one end is the dining room, at the other end the piano and books. In the center around the fireplace are lounges and chairs. Windows were cut into the walls of the lighthouses and two bedrooms arranged in each tower—one upstairs and one down. The original stairs in each which led to the lantern tops is intact.

The entire house is furnished with Cape Cod furniture—pieces picked up at antique auctions.

Most country homes have names, some of them scenic, some arboreal, some geographic, but very few significant. No more intelligent selection of names could have been made to describe this delightful summer home than the well-chosen appellation, "The Towers." It is certainly original, descriptive and appropriate. The Towers is painted white with green shutters. Its setting in the pine woods brings the richness of the background into prominence.

Nothing is quite so charming as a bit of surprise, an element of adventure, nothing quite so delightful as to sit in a half-hidden spot in the pines near The Towers and watch the wild deer loping past at sunrise and sunset to a fresh water pond in the vicinity. The deer are so plentiful here that it is impossible to grow vegetables due to the depredations of these beautiful, sleek creatures.

Seeing Things in London Now and Then

Concluded from page 3

"L" with a rounded curve. Back of it are two barmaids—girls in their early twenties. They are very neat and nice, attend to their business and have nothing to say to customers.

The barroom is small, large enough to seat only eight or ten persons. There are no chairs. Benches are built around the wall. The end of each bench has an arm, like the arm of a pew in a church. A beetle that likes dry wood has eaten great holes into these arms.

Near the benches is an old table upon which rests a large parrot cage. The parrot is an old attraction, well known to the customers. A lawyer who looked enough like Senator Borah to be his brother was kidding the parrot one evening when I came in to dinner.

"What do you want, Polly, what do you want?" he would say.

"Scawtch," came the answer. "Scawtch."

"Pull the cork, Polly," the lawyer would say, while he himself went through the motions of holding a bottle near his knees, turning a corkscrew into it and then pulling.

Just as he pulled, the parrot would make a noise exactly like a cork coming out of a bottle. Which, of course, made the lawyer and his friends laugh.

In one corner of the dining room a brass tablet marks the spot which is said to have been Dr. Samuel Johnson's favorite seat. A few feet away, another brass tablet indicates where, 200 years later, Charles Dickens used to sit.

The dining room will seat perhaps twenty-five persons. Benches are built around the walls. On one side, benches run at right angles like church pews, with a table between each two. Also, there are old chairs.

In the Cheshire Cheese

THE "Cheese" has but two bills of fare, one for winter and one for summer. During winter, the great dish is "Ye Famous Rump Steak, Lark, Kidney and Oyster Pudding," with different side dishes for each day of the week. Chief among the side dishes is "Ye Famous Pudding." In summer, the chief dish is also "Ye Famous Rump Steak Pie," with pudding and such fruits and vegetables as are in season. The cooking is excellent. The food is heavy, but about once a week it strikes the spot.

Books have been written about the old Cheshire Cheese tavern. Johnson made it the haunt of writers and the haunt of writers it has ever been and still remains. The list of the famous persons who have visited it reads like a list of the great writers of the last 300 years. Old Samuel Johnson put the pith of the place in a paragraph when he said: "There has nothing yet been contrived by man, by which so much happiness is produced as by a good tavern or inn."

London is too big to be seen, just as New York is too big. One can see Paris, but not New York or London. I did not make any serious attempt to go about in London, but in the course of my work I saw a great deal. The impression that I carried away with me is that London is a real town—a big place that is doing big work in a big way. Everybody seems to be doing something worth while. After you have been there a few weeks, you respect the place. You see that it has no shoddy. Of course, there is shoddy in it, but it is so small a part of the whole that it is not conspicuous.

But it is rather a sober place. You hear no music, for the most part, except in the hotels and restaurants that cater especially to Americans. Such places form a small percentage of the whole. Englishmen do not care for music at their meals. The best hotels have none. There are doubtless exceptions, but as a rule Englishmen prefer to enjoy their meals without the aid of an orchestra.

I did not observe any anti-American feeling in London, though I did find plenty of misunderstanding that had produced soreness. Whenever I found such misunderstanding I tried to remove it and always succeeded in doing so. Englishmen are reasonable when they understand.

Britain's Debt to America

ONE day I went into a cigar store to buy a package of smoking tobacco, the price of which in the United States is 15 cents. I was charged the equivalent of 57 cents. I told the dealer what the tobacco cost at home.

"Yes," he replied, "but we are taxed to pay money to America and it comes out of us. We have to pay more for everything and charge more."

I knew the feeling that prevails in Europe—that America is rich but a Shylock; so I explained to him that the men and women who bought Liberty bonds to enable the American Government to lend to the British Government were not rich; that for the most part they were poor; that they bought bonds, not because they were bond-buyers but because the government asked them to and that most of them sold their bonds for less than they paid for them. I explained to him that the money England borrowed came not from the rich but from the workingmen. That put an entirely new light on the matter. The Englishman seemed satisfied to go on paying his interest to America.

I did not like London at first. It rained all the while for a week and the thermometer went down to 47, which is rather cold for June. I also used to get lost every time I ventured to walk far alone and had to be hauled home in a taxicab to find myself. But after the weather cleared and I learned the streets, I liked the place immensely. The morning I left for Paris I walked two blocks to take a last look at Piccadilly before taking a train for Dover. The English are a fine people, staggering under a heavy burden, but determined to pull out.

Largest Yacht Club Holds Diamond Jubilee

Southern Holds Celebration on Shores of Beautiful Lake Pontchartrain

By HARRY H. DUNN

THE largest boating club in the world, and the second oldest in the New World, this autumn celebrated its seventy-fifth year of existence as a continuous organization. Founded in 1849, the year of the great gold rush to California, and twelve years before the Civil War began, the Southern Yacht Club, located on the shores of beautiful Lake Pontchartrain, on the outskirts of New Orleans, commemorated its three-quarters of a century of life with a Diamond Jubilee festival which attracted the attention of yachtsmen the world around.

With a membership of more than 2,700, the greatest of any similar organization in the world; with a fleet of more than 500 motor and sail boats, valued conservatively at $6,000,000, and with an investment of $450,000 in clubhouse and boat pen and equipment, this club yields only the palm of age, and that to the New York Yacht Club alone. The Atlantic Coast organization was founded in 1846, and is, therefore, three years older than the historic southern yachting body.

Invitations were extended to the governors of all the states, commodores and other officials of all the yacht clubs, and prominent men and women from all parts of the country to attend, and numbers of them accepted. The new $250,000 clubhouse of the S. Y. C. at West End was the home of the visiting yachtsmen, for the two days' celebration. There was a review of the entire fleet of half a thousand boats entitled to fly the burgee of the club, led by *Natasha*, flagship of Commodore W. Milton Miller, head of the club. There were motorboat and sailboat races, and regattas, forenoon and afternoon of each day. A banquet and a ball were held, and the entire affair concluded with a cruise to a few of the islands along the Gulf Coast of Mexico.

But, more important than this celebration, which was the largest and best ever held by a yachting organization in southern waters, is the fact that here is a club which has held together for three-quarters of a century, during some of the most stirring years of the history of the South. The Southern Yacht Club was organized by a handful of lovers of deep-water sailing, in the old Montgomery Hotel, at Pass Christian, Mississippi, on July 24, 1849. Edwin Burgess and Nat G. Herreshoff, since become famous as designers of ships and yachts, were born in that year, as was also Luther Burbank, the plant magician of California. In that year, Zachary Taylor was inaugurated President of the United States, and the Department of the Interior was established at Washington. For the first time railroad trains made continuous runs between New York and Boston, in that year, and the first telegram ever sent from Chicago to Milwaukee passed successfully over the wires.

Eighteen men formed the charter membership of the new yacht club, of which James W. Behan, of Pass Christian, was elected president, the title of commodore then being forbidden, except in the U. S. Navy. Besides Mr. Behan, there were present at this meeting, Thomas Kershaw, J. O. Nixon, Mortimer Turner, E. Jones McCall, J. B. Walton, S. L. Levy, M. Farrell, H. Fassman, A. B. Cammack, H. E. Lawrence, J. B. Rathbone, John Hiddleston, S. F. Herrman, B. F. Simms, John G. Robinson, R. H. Montgomery, and H. Rareshide. The vice-presidents of the organization were W. L. Balfour, of Mississippi City, Mississippi; Thomas Byrne, of Biloxi, Mississippi; James Campbell, of East Pascagoula; and George Urquhart, of New Orleans, not all of whom were present when the first meeting was held. J. O. Nixon, of Pass Christian, Mississippi, was the first secretary.

The first regatta of what has since become a historic organization was held on August 6, 1849, on the waters off Pass Christian, Mississippi, the first contest of the kind ever held in the South. Eighteen sailing craft, sloops, schooners, "sandbaggers," and other wind-propelled small boats got away to the start of this regatta, before an audience drawn from Mississippi, Louisiana, Alabama, and Eastern Texas. The sloop *Undine*, owned and sailed by R. A. Heirn, won the race, which was over an eighteen-mile course, that distance being selected because of the number—eighteen—of men who had organized the new yacht club. Oddly enough, there also were just eighteen entries in the first race of pleasure boats ever held in the South. Of these eighteen entries, three were owned by J. G. Robinson, who afterward became commodore, and three by J. O. Nixon, who was secretary of the club for twenty years. The Robinson entries were the sloops *Mary Baker, Virginia* and *Pilgrim;* while the Nixon entries were the sloops *Harry Hill, I. L. Titus* and *Cora.* The first three to finish were *Undine,* first; *Eliza Riddle,* owned by H. Rareshide, second; and *Coralie,* owned by Thomas Byrne, third.

Inasmuch as the club was organized on the coast of the Gulf of Mexico, the meetings in the summer were held at Pass Christian, but, as winter came on, and the summer visitants on the Gulf Coast returned to New Orleans, the club followed its members back to the "City Care Forgot." Gradually, New Orleans became the "home port" of the organization, whose meetings were first held in the old Veranda Hotel, at St. Charles and Common streets, a building which still stands, and thereafter in the original St. Charles Hotel building, which was destroyed by fire many years ago. In 1851, seventy-three years ago, T. S. Dabney was elected to the presidency of the club. He was succeeded in 1853 by Harry W. Hill. Under the administrations of these two men, the club was placed on a firm financial basis, its fleet enlarged, its regattas increased in size and importance, and the organization established in New Orleans. In 1854, Thomas Kershaw became the first "commodore" of the club, the ban on the use of the title outside the navy having been removed. Commodore Kershaw was followed by Sidney Story, who served two terms, being succeeded by John G. Robinson, who was destined, after the Civil War, to assist the then Commodore Emile O'Brien in the reorganization of the club. Mr. Robinson also was one of the now celebrated eighteen men who organized the club in 1849.

Auspicious as were the beginnings of the Southern Yacht Club, and enthusiastic as had been its reception by both men and women along the Gulf Coast of the United States three-quarters of a century ago, the Civil War dealt yachting in that section a blow from which it would not have recovered for years had it not been for the determination of the men engaged in the building of a new South on the ashes of that conflict. In fact, it was not until the election of Emile J. O'Brien as commodore, in 1879, fifteen years after the close of the Civil War, that actual reconstruction of the Southern Yacht Club began. He served two terms, 1879-80, and was succeeded by A. A. Maginnis, who so ably carried on the work begun by Commodore O'Brien that he was given three terms, 1881, 1882 and 1883. There was such a demand from all the membership for the return of O'Brien however, that he was elected unanimously as commodore in 1884, 1885, 1886 and 1887. He was succeeded by Robert S. Day, who served four successive terms, from 1888 to 1891, inclusive.

All of these commodores owned and sailed their own boats, J. Walton Glenny, who became commodore in 1897, and served two terms, owning and sailing five fast boats, in as many different classes. He was the premier boat-owner of his day, his flagship being the sloop *Tawanta,* at one time the fastest boat of her type in the South, while in his fleet were the *Lucy, Gypsy, Lufkhumma,* and *Ishkoodah.* Following Mr. Glenny, Albert Baldwin was elected commodore, and under his administration, the large clubhouse which stood for some years was financed and erected. L. H. Fairchild, S. F. Heaslip, Ernest L. Jahncke, and Chandler C. Luzenberg, succeeded as commodores in the order named, and under the administration of Commodore Luzenberg, the club sent 150 members, all trained sailormen, into the naval service of this country during the World War. Percy S. Benedict, elected commodore by unanimous vote in 1918, found the club with 1,200 members, and $16,000 indebtedness. Under his administration, the membership was increased to 2,600, the indebtedness wiped out, a $250,000 clubhouse built, and more than $250,000 more expended in improvements to the boat pen and the grounds of the club. The organization now has one of the largest, if not the largest, clubhouses owned by any boating organization in this country, and boasts a fleet of more than 500 power cruisers, speed boats, auxiliary yachts, schooners, sloops and other motor and sailing craft. The estimated value of this fleet is $6,000,000, and boats are being added to it yearly. An effort is now being made, with excellent prospects of success, to increase the membership to 3,000. Careful selection is made of all candidates for membership, and the club is being kept purely American.

The present commodore is W. Milton Miller, under whose direction the Diamond Jubilee celebration of the Southern Yacht Club was held on September 20, this year.

Among the men who have contributed greatly, in an unostentatious way, to the development of the Southern Yacht Club is W. H. Parham, who has been secretary-treasurer for nearly twenty years. So great have been the services given by Mr. Parham to yachting in the South that the Mississippi Valley Powerboat Association, the leading organization of its kind in the world, recently elected him president. Commodores come and commodores go at the Southern Yacht Club, but "Bill" Parham goes on forever, guiding the business, boating and social activities of the club so cleverly that every one of the 2,600 members is a "booster" for him.

Each boat is named for some well-known fish, and, as all the boats in the class are exactly alike, skill in seamanship wins in each contest. Rathbone de Buys, a prominent architect of New Orleans and an enthusiastic member of the Southern Yacht Club, has been chairman of the Fish Class Committee, and has developed the sport to such a point that young women from New Orleans, Biloxi, Mississippi, and Mobile, Alabama, have taken up the sailing of these one-design boats with much enthusiasm.

The longest motorboat race within the waters of the United States is held annually under the auspices of the Southern Yacht Club. The course extends from the clubhouse at West End, New Orleans, on Lake Pontchartrain, to Pensacola, Florida, and involves driving the speedy cruisers through the shallow waters of Lakes Pontchartrain and Borgne, the complicated channels of the streams connecting these lakes and linking them with the Gulf of Mexico, and eventually, some ninety or more miles of running on the open Gulf, where storms are not infrequent, and where direction is by the compass alone. Thus, in addition to keeping itself alive for three-quarters of a century, the Southern Yacht Club has developed sailing and motorboating along parallel lines, giving equal attention to each, until it has made the lower end of the Mississippi Valley a center for one of the best, cleanest and most healthful of outdoor sports.

One of the oldest cups raced for by the fleets of the Southern Yacht Club. This is the Southern Yacht Club trophy, first contested for by sailing craft at Pass Christian, Mississippi, in 1854, just seventy years ago.

Above, left—DR. W. MILTON MILLER, commodore of the Southern Yacht Club during this, the seventy-fifth and Diamond Jubilee year of its existence. Above, right—EX-COMMODORE PERCY S. BENEDICT, under whose administration, three years ago, the development of the half-million-dollar plant of the Southern Yacht Club at New Orleans was accomplished. Below—New $250,000 clubhouse, part of the $450,000 plant of the Southern Yacht Club at New Orleans.

Science Captures and Imprisons a New Vitamin

The Story of How Six Magical Crystals Were Isolated and Bottled Up

By MAX BENTLEY

SOMETHING happened recently to set scientific tongues wagging. The medical journals were full of it, but the lay world may have overlooked the modest announcement by Dr. Walter H. Eddy, of Columbia University Teachers' College. The announcement was that he and his associate, Dr. R. R. Williams, of the Western Electric Research Laboratory, with the assistance of Dr. Ralph W. Kerr, of Columbia, had isolated—for the first time—had captured and imprisoned in a bottle, a pure-D vitamin.

Dr. Eddy told me the story as we sat in his laboratory overlooking the beautiful university campus. It fell from his lips in simple words. Only when he suddenly reached into the lower left-hand pocket of his vest and produced a small phial containing six white crystals, with the offhand remark that "These are pure vitamins," was it realized that his narrative was an epic such as no man has had the right to speak before. The phial toppled over with a faint and musical clink and rolled erratically toward the edge of the desk. Four frantic hands made reach for it. Eddy, who recovered it, smiled in ghastly fashion as he stowed it away. The thing was priceless.

Why was it priceless? What had made this feat so big?

Well, behind it is a forty-five year background, the last twenty-five years of which have seen a devoted little band of scientists pushing against the door of dietary knowledge, gaining an inch at a time, in search of the fifth food factor without which, it was then suspected and is now known, man cannot live. What they sought—and found—was literally a golden fleece for man's ailing stomach. The world now calls it a vitamin. In due time they discovered it, an elusive something too tiny for even microscopic detection, lurking in the so-called impurities of nearly all foods; and they proved that it controls diseases. Since 1906 *six* vitamins have been discovered and turned to account for mankind. What Eddy and Williams and Kerr have done is to lift a vitamin from its hiding place and offer it to the world in crystal form.

Something should be told of that background. To appreciate Eddy's story, laymen should know something of the origin of those six vitamins, where they were found, what their demonstrated uses are, and why they are called vitamins.

The story rests on this self-evident truth, that the functioning of the human body is the world's greatest mystery, outside of life itself. The best minds have studied it, and not one has yet answered the question of what makes it work.

The starting point to solution is, of course, food. Food starts the body going and the absence of food brings it to a full stop. For fifty years science has grouped all foods into the four major divisions of carbohydrates, fats, proteins and mineral salts. Every school child knows about them. They are the elements needed to build muscular energy and supply a reserve thereof, create and repair the tissues, make bone construction, and, collectively, govern appetite and digestion by satisfying the one and regulating the other. They accomplish all this through heating, and the amount of heat they liberate is measured in terms of a unit called a calorie. The calorie is a unit of heat, nothing more, precisely as the pound is a unit of weight.

But heat is not self-starting. "Laying a fire" does not supply heat: you have to touch off the kindling. There must be a substance within the body, taken in with the food, that supplies the spark that lights the fire that starts the heat that feeds the body. And there is. It is the vitamin. The vitamin is the spark, the little stimulator, touching off the inert mass of food in the stomach, lifting it from a dead state into a living something which starts to working. Without the spark the automobile will not run—without a vitamin or so in his food the human being would perish forthwith. All life would end without it.

The history of the vitamin goes back to 1881 and an unreckoned remark by the German scientist Lunin that the commonly accepted food "balance" of carbohydrates, proteins, fats and minerals was incomplete; that something was still missing—that it was indispensable. Unreckoned, yes, but on the way to proof the next year when beriberi ravaged the Japanese navy and was cured by the cutting down of the polished rice ration and the addition of milk and meats. The change did not alter the ratio of carbohydrates, proteins, fats and minerals, and the calories were undisturbed, but it restored ailing sailors to health.

Fifteen years later Eijkman, a Dutch physician, found that fowls fed on cooked polished rice invariably developed symptoms akin to beriberi, and could be cured with raw unhusked rice. This was a step further. It proved that the husk of rice, lost in the milling, contained a curative for beriberi. Eijkman, of course, did not know it, but the little lurking something in the husk was a vitamin—later definitely to emerge as vitamin B and be found in a variety of foods including eggs, yeast, animal liver, root and leaf vegetables, and fruits.

The first vitamin was still unclassified when, in 1900, the Belgian doctor Wildier reiterated the Lunin theory and poetically named the missing factor "bios" (life). His, too, was a voice crying from the wilderness, but a few years later Gowland Hopkins, of Cambridge University, pushed the door at least half open with his discovery that sore eyes were, like beriberi, diet-deficiency diseases and could be controlled by the grouping of certain foods.

Hopkins experimented on rats. Milk was the ingredient used. Milk is the perfect food. It is singularly well balanced in carbohydrates, proteins, fats and minerals: on a total of 100 units the ratio of the first three constituents is five-five-four. Milk is easily synthesized; all its constituents, or their isolated equivalents, can be made into "manufactured" milk and fed in quantities sufficient to supply the fuel needs of the body, instead of whole milk itself. That sort of diet *ought* to be satisfactory.

But it was not. Hopkins tried it on two sets of rats. Both sets were given synthetic milk, and one set was also given a minute quantity of whole fresh milk. The result was astonishing. The whole milk-fed set thrived and produced offspring, while the set restricted to a synthetic diet developed sore eyes and declined rapidly. The formula was reversed—it proved! The test extended over a period of fifty days—and fifty days in a rat's life is equal to twenty-four years, the entire growing period, in a human being's life. From Hopkins' experiment emerged what is now called vitamin A, very potent in butter fat but subsequently found to abide in many animal fats, fish oil, eggs, and green vegetables.

The vitamin was named by Dr. Casimir Funk in 1911, after he had added yeast as a source of beriberi cure. Funk was the first scientist to attempt vitamin isolation. By reducing 200 pounds of yeast to one-twelfth of an ounce he found that he had a substance which, while it was not pure, was electric with curative qualities. He called it a "vitamine," connoting the term "vita" (life) with "amine," in the belief that the amino acids in the body were the habitat of the fifth food factor. That theory has been disproved, but the name was retained, with the final *e* whacked off in deference to science and its passion for strict accuracy even in nomenclature.

The discovery that a diet lacking fruits and green leaf vegetables produced scurvy added vitamin C to the scientific map. Axel Holst developed scurvy among guinea pigs by feeding them whole milk and yeast. Since those two foods were rich in vitamins A and B, it followed that the pigs would not develop eye diseases nor beriberi—the fact that they developed scurvy was another step forward. It showed that diseases can be created, as well as cured, by food grouping. Holst cured his pigs with a small addition of orange juice. Since undernourished children are peculiarly susceptible to scurvy, his experiment emphasized the importance of adding orange juice to an infant's diet.

Vitamin D, a preventive for rickets, was found by Dr. E. V. McCollum, of Johns Hopkins. E, or X, newest of discovered vitamins, has been found by Drs. Evans and Bishop to produce fertility. Their experiments have shown that while rats will thrive on foods rich in vitamins A, B and C, they will not produce offspring without the addition of other foods; the *ergo* being that there is a something in those foods necessary to prevent sterility.

With six vitamins classified, the next achievement was the complete isolation of a vitamin: the recovery of a pure homogeneous substance whose chemical constituents could be, and actually were, determined upon analysis.

That is the story Dr. Eddy told me. He calls his white crystals bios, from Wildier who identified it in 1900 as "that extract of certain substances able greatly to stimulate the growth of yeast cells." Until Eddy and Williams began experimenting with autolyzed brewer's yeast to run down its elusive reproductive spark it was commonly thought that bios was simply vitamin B under another name. Eddy and Williams themselves thought that was so, but it is now definitely said by them that bios is not vitamin B. They are not sure, however, that it is not synonymous with vitamin D.

The isolation of bios has been the result of the joint efforts of Eddy, Williams and, in the latter stages, Kerr. The process was toward separating the vitamin promoting the yeast growth. At first they tried solvents but without obtaining a pure substance, although in certain cases they obtained complexes of high activity. Finally, reaching a stage where they required a trained organic chemist, they called in Kerr; and, at his suggestion, turned from solvents to absorbents.

"To make this clear to the lay reader, consider the following problem," said Eddy. "Suppose I have a mixture of sand, salt and sugar. Obviously with water, a solvent, I can never completely remove all the sugar in free form, for sugar dissolves in water. Salt is similarly soluble, but sand is not. If, however, I could use something to which sugar would 'stick,' and salt and sand not stick, I could use this something to drag out my sugar.

"Such a something is an absorbent. In the late war (Eddy was chief dietitian of the A. E. F.) we used an absorbent, charcoal, to pick poisonous gases out of the air. Fuller's earth is another absorbent. Our first step in the successful isolation of bios made use of fuller's earth. That was practical as far as it went, but we found our solutions still rich, not only in bios, but in other substances. We then turned to Kerr's suggestion of the use of what is known as colloidal iron hydroxide or ferric oxide hydrosal."

That solved the difficulty. Eddy and Williams discovered that at a certain acidity they could first make the iron pick out a great many impurities and not touch bios; and then, by taking a new lot of iron and reducing the acidity, actually make the bios stick to it. When that effect was obtained they had only to "tear away" the iron from the bios to secure the latter in free form.

"One very happy morning we attained that step," Eddy went on. "In other words, we obtained a new solution in our experience which was a powerful stimulant to yeast growth, while the residue—the substance left behind in the yeast solution—had lost all its stimulatory property. Another long series of experiments followed. They definitely proved our product to be a homogeneous crystalline substance, free from any impurity, melting sharply at 223 degrees centigrade, having the formula $C_5H_{11}NO_3$ (carbon, hydrogen, nitrogen and oxygen), and a molecular weight that seemed to confirm the formula. Also tremendous physiological effect in almost infinitesimal quantities: for 56/1,000,000 of a gram of bios a cubic centimeter of culture medium will increase the growth of yeast twentyfold, and it takes nearly thirty grams to weigh one ounce avoirdupois.

"How does bios make a yeast cell grow? Another problem for the future: is it possible of synthesis? Will our method work for other vitamin separation? Those are all points demanding much more study, but not one is impossible of solution. Meanwhile, we are happy to have secured for Columbia University the credit for what we believe is an important step in progress to a better understanding of nutrition and hence of betterment of the race in general."

Being a people that eats on the run, will we ultimately abandon live foods in favor of vitamin-loaded pellets? No, says Eddy, not so long as appetite governs mankind. If he, Eddy, thought his bottled vitamins might bring about that sort of thing he would, some dark and stormy night, remove the phial from the lower left-hand vest pocket, pry off the stopper, step to the rail of the ferryboat which transports him nightly to his Jersey home, and with a glitter of the eye, albeit with a sigh, drop six whitish homogeneous crystals into the turgid deep for the advancement of science among the benighted fishes. Dr. Eddy confesses to loving his porterhouse steak and onions even more than he loves his science.

It is a fact, he points out, that only one-twelfth of our day is spent in eating, but the amount of sheer happiness we derive from eating and the thought of eating soon is another matter; it is out of all proportion to the time involved in the process itself. There may be, he intimated, some scientist wandering in the outer darkness willing to offer himself as an experiment in the life-sustaining qualities of pellets unrelieved by a dash of raw vulgar food, but (with a twinkle), "You and I and the world will continue to lay store by our porterhouse and onions. In that direction we draw a deadline for the advancement of learning, and we draw it red." Besides—and Eddy agreed to this, too—how about the calories? It takes quantity to make the calories that liberate the heat that makes the body live, and you cannot get quantity from a pellet.

All that, said Eddy, is just plain foolishness. But this is not: The isolation of bios suggests marvelous possibilities for the transport of more foods, and better foods, in compressed form, to famine-stricken areas where fresh foods are not to be had. He does not believe it is drawing the long bow of imagination to see a day when science will be able to spray a few milligrams of crystal vitamins into a few tons of "dead" foods, and electrify the mass with life. Since vitamins A, B, C and D can be put back into de-vitamized milk, rice, potatoes and butter, and, respectively, heal a sickly animal's sore eyes, cure beriberi and scurvy in man or beast, and bring new life to the child with rickets, will it not be possible some day to cure *all* diet-deficiency diseases simply through the discovery of new vitamins? Vitamin possibilities are enormous, but are they limitless?

Forty-five years ago a German doctor said: "The food balance of carbohydrates, proteins, fats and mineral salts is not sufficient to supply the perfect diet. Something is missing, something that is indispensable. There must be a fifth food factor."

And there was. It was the vitamin. Science has made great strides since Dr. Lunin advanced his theory. Today six vitamins are on the map of science. They are:

Vitamin A, found chiefly in butter, fish oils, but not vegetable oils, eggs and green vegetables. It is antixerophthalmic in nature; that is, it is a preventive and curative of eye diseases.

Vitamin B, in cereal embryos, eggs, yeast, animal liver, root and leaf vegetables and fruits, is antineuritic: cures beriberi, supplies nerve reserve.

Vitamin C, in fruits and green leaves of vegetables, is antiscorbutic: cures scurvy, and is the effective agent in sound bone and teeth formation.

Vitamin D (Funk), now thought to be synonymous with bios, in yeast and plants is rich in vitamin B. Promotes yeast growth.

Vitamin D (McCollum), in cod liver oil, egg yolk, and so on, is antirachitic: cures rickets, and appears to regulate absorption and use of lime in body structure.

Vitamin E, or X, in lettuce, whole wheat, milk, and so on, produces fertility; is, therefore, essential to the continuance of life.

Mexico's Children—Submerged in World-Lost Little Villages

By HELEN BOWYER

This is the first of a series of articles in which the writer displays an intimate knowledge of conditions in Mexico. Social welfare work among the people of this country has furnished material for much that is interesting and illuminative, and not hitherto published.

Homeless boys who are being cared for by the Mexican Humane Society founded by an American woman.

WITHIN a score of years, these children of Mexico will be the citizens with whom we shall have to deal in all those tangled relationships with our southern neighbor which, in the past, have so sorely taxed our understanding and good will.

For in Mexico not only do adults under thirty-five outnumber all the rest of the adult population, but the generation now growing up is the very first to be given any widespread exercise of citizenship.

The constitution of 1917 conferred the suffrage on all men of twenty-one and over but the overwhelming majority of these men are quite unaware of this fact and could not understand it if it were imparted to them.

So it is only as the children reach their majority that we can hope that public opinion will influence public action south of the Rio Grande.

We think vaguely of Mexico as "Spanish America." But of course it isn't. Mexico is Indian America. Of the fifteen million inhabitants of that big, half-empty land, it is doubtful if one million are of pure Spanish blood. Six of the remaining millions have never had a white drop in their veins while the other eight, the *mestizos,* or mixed breeds, are mixed in very little except their type of civilization. Racially it is not possible that they could be much mixed.

In all the long three hundred years that Spain held Mexico not more than three hundred thousand of her sons crossed to the colony to pour their blood into the bronze sea of its native races. And how much difference could three hundred thousand of them make, strung out over a period of three hundred years?

So Mexico's children are Indian and if we are to do anything to help them—even to the extent of a sympathetic understanding of them—we must keep this biological fact clearly in our minds.

Mexico's children are, moreover, peasants, born into the life of primitive and world-lost little villages. Only about three million inhabitants of the republic live in cities, even if we class as cities places of four thousand. And of these, at least 50 per cent earn their bread in the fields on the edge of the town where the cobblestone streets peter out. And finally the mass of these children whose generation is, perhaps, to form the first active citizenry of Mexico are, by all our standards, sub-civilized little humans, gentle, courteous, most appealing ones, to be sure, but still children whose material environment and mental outlook is little above that of young Kanakas and Malays. The most generous estimates of even the Mexican authorities do not place the number of their people "living in a state of white culture" at more than three million. For the other twelve million, of all that proud civilization which Cortes brought with him from old Spain, little remains but the Catholic faith and the Spanish tongue. The rest of their environment comes to them from old Anahuac and Michoacan and other ancient entities of Montezuma's realm.

It is not much that comes. Montezuma slain, their local chieftains hostages, the common people were soon reduced to that level of brute subsistence in which we find them today.

"They are *animalitos,* nothing more," said the governor of one of the little states through which we took the Family Welfare Expedition of the Ministry of Agriculture. Of course, that "nothing more" was only a turn of Spanish speech. The divine fire has broken out too recently among the people of this state to leave any question that it is smoldering still.

Mexico's children, then, the mass of them, the children who in twenty years and less will form the bulk of the voters, are Indians, peasants, sub-civilized, even *animalitos.* And it is to them that we are to look for co-operation in the solving of those border and trans-border problems which yearly grow more complex and which, within the next score of years, may reach a magnitude which no man now can gauge.

For if democracy is to become a fact in our neighbor republic, there will be no one else to whom to look. And, this being so, we could do no better turn, either to ourselves or to the sons and daughters who will inherit both our achievements and our problems, than to invest a little thought, a little kindly interest, in the subject of these children.

First, then, how many of them are there?

If we classify as children the boys and girls under fifteen, we shall find about six and a half million of them in the land. If to this we add the youth between fifteen and twenty, we get a group of minors aggregating eight million.

Eight million. That is not so many. In the United States we have a much larger number to care for, forty-three million, perhaps.

No, eight million are not many. The care and education of just that number would be child's play for us.

Owing to the appalling death rate among the younger adults, Mexico is full of orphans. A group of them asleep at night in the streets of the capital.

But for Mexico it constitutes a burden under which she can probably never rise to civilization without some outside help.

Her total population is only fifteen million. If eight million of these are children, it follows that only seven million can be adults. In our country for every eight million children under that age there are twelve million persons of twenty years or more.

That is to say that while in our country there are twelve grown persons to bear the expense and care of every eight minors, in Mexico there are only seven, less than one adult for every child.

How does this happen? Whence comes this enormous disproportion of minors to adults? Is the birth rate among Mexicans so much higher than among us?

The *birth rate* is higher but it is the *death rate* that explains the situation.

The mortality among the children themselves is incredible, appalling, but the thing that makes their position catastrophic is *the mortality among the adults.*

Among the *younger men and women,* those from twenty to thirty years of age, they *die at almost three times the rate* of the corresponding group in the United States. Among those in their early prime, those from thirty to forty-five, there is an average of three and a half deaths for every one in our country. Few ever reach the age of forty-five—*only one out of five Mexicans attains the age of forty.*

What are the consequences of a state of things like this? Well, what would they be among ourselves? What would happen in our country if the mortality among our grown-up citizens should jump to three times its present rate until only seven out of every fifteen Americans of us were above the age of twenty? We should still feed and clothe and shelter our young after a fashion. The Mexicans do that and with our traditions behind us we should do it better than they. But what would happen to those public activities on which we depend so much for the rearing and the civilizing of our children? What would become of our schools, our libraries, our health services, our settlements, playgrounds, juvenile courts, mothers' pensions? Where would the money for them come from, if, while the burden remained as heavy as ever, the number of adults to bear the burden were cut by more than a third? And if only three—less than three—out of every fifteen of us were as old as forty, whence would come the maturity, the experience, the judgment to organize and administer these things?

Is it any wonder, then, that Mexico's children should be peasants, sub-civilized, even *animalitos?* There have never been enough grown people in the land to raise it much above the level of primitive subsistence.

It would seem, therefore, that the basic need of the rising generation was an increase in the number of adults in the population of the *patria.*

The Mexican authorities seem to have recognized this need—as for centuries before them their predecessors have done. And they are seeking to meet it by immigration—as in the past their predecessors have sought. Scheme after glowing scheme has floated through the mind of official and amateur statesman, colonies have been planned, foreigners have been assembled from every corner of the white man's world and planted in that sun-drenched land below the Rio Grande. And all to no avail. Mexico is the white man's land in that its destiny is indissolubly linked with his, but it is not, perhaps never can be, the white man's home. If nothing else stood in the way, there is the insupportable altitude—insupportable over any considerable period, that is—at which the greater part of the country lies. Perhaps the yellow man can support it. He is making a determined tryout of it these days. But the Mexicans do not want him in their borders. And we, do we want him that near?

If, then, white immigration cannot furnish the needed increase of adult population and it is undesirable that yellow immigration should, the only feasible plan seems to be to have the native do it. It is an idea so simple that you would suppose it must have occurred to the Mexican authorities. But if so they have never taken the steps to put it into action. Probably they cannot. Probably if it is to be done, we shall have to help them.

Obviously, the way to increase the number of adult natives is to keep the adults now living from dying in their early maturity. And obviously the first step in that enterprise is to find out why they die.

Well, there is no mystery about that. They die of digestive diseases, of pneumonia, of tuberculosis. They die of smallpox and malaria. They die of all sorts of sicknesses induced by insufficient food and bad food, by sleeping arrangements indescribably wretched, by a lack of sanitation such as the untraveled American cannot even conceive.

There is no need for this state of affairs, much less need in that radiant land than in our own sterner climate. A little effort, a little organization and all the simple things that make for life might be abundantly within the reach of all. But the Mexicans cannot make that effort, they cannot develop that organization, unaided. If it is to be done—done, at least, in time to be of any use to the rising generation—we shall have to help them do it.

For the Mexicans are sick. Those of their adults who are not yet dead are sick with all the diseases that have killed off those that are. They are debilitated with stomach trouble; they are dragging round in all the stages of bronchial and pulmonary affections; they are chilling in the paroxysms of malaria or sunk in the apathy, the good-for-nothingness that is its after-effect. There is probably no people in the world as sick as the Mexicans, as universally, as continuously sick. And the last thing we can ask of sick people is that they themselves shall organize the measures to drive Death away. We can ask their co-operation, we can ask that trusting compliance which, in our own isolated districts, the sick man accords the neighbor who comes in to care for him. But the initiative, the energy, the directive power to combat the Destroyer we cannot ask of the misery, the apathy, the disheartenment of illness. So, if the Mexican people are to cut down that appalling, that de-

Mexico's children are peasants—born to the life of world-lost little villages.

Breaking—the Means of Making

Factors in the Strange Fate of the Foreign Trade Financing Corporation

By HAMILTON YORK

Why should German business men not do business direct with American business men? Why should a Jewish intermediary hold them apart? This second article deals with these matters.

THE backbone of the struggle of certain political Jews for an international super-nationalism lies in their financial program. It is characterized by so little of the spiritual that it may be regarded as almost materialistic. Idealistic, to be sure, but at the expense of non-Jewish elements. Its progress as a whole may be gauged by the success of its achievements in the world of international finance.

The system by which Jewish overlordship in Germany is maintained has for its basis the control of credit and the fluid capital of the Reich. The means used are the banks. It is impossible to do business with anyone in Germany without using the facilities which this group controls. It can have anything that it desires in Germany and almost without opposition.

The entrance of Jewish methods of economic slavery into the United States, methods characterized by interlocking directorates of major key banks, pyramiding of banks and corporations and allocation of interest, was not possible without a revolution of American banking laws by legislation. Congress has passed within the past decade, the Federal Reserve Act, the various acts which established land banks and joined them to the Federal Reserve System, the so-called intermediate credit banks, the Edge Act which authorized the establishment of banks for special financing of exports, and the re-establishment (temporarily) of the War Finance Corporation, under Eugene Meyer, Jr.

The principle that banks may hold stock in other banks has been introduced into the fiscal system of the United States; the amount is still limited, to be sure, but *the principle has been established.* The enormous increase in the establishment of branch banks has the same if not more positive effect.

The American Plan Was Not Favored

THAT the Jewish nationalists do not hesitate to scuttle anything which runs counter to their program or which they cannot control is best illustrated by the events now to be described. Mr. John H. McHugh, a well-known New York banker, with the most patriotic motives in the world, endeavored to establish in 1920 under the Edge Act, the Foreign Trade Financing Corporation. The attempt failed, but the reasons for its failure are important to the American citizen.

The principal reason was the authorization by the Federal Reserve Board for American member banks to rediscount *German Schacht Bank acceptances.* These German acceptances reach this country *exclusively through the International Acceptance Bank of No. 31 Pine Street, New York City.* This is Mr. Paul Warburg's *protégé. The principle has been established, and no limit has been set as to the amount which may be so rediscounted.*

When these acceptances reach that ultimate potential destination, under present laws, paper currency may be issued against it, and a certain portion of it will find its way back to the German bank which issued the acceptance. This form of financial jugglery simply means eating your cake and also having it.

The commercial leaders of the United States had the right idea as a post-war program, everybody go to work and produce. The world needed the products. That program indicated that markets must be found for surplus production, and immediately the government and especially Congress was called upon so to arrange matters that world trade with the United States could be carried on with the least effort. Among other things, a mechanism for providing long-term credits must be devised. The markets in countries like those of South America, where the consumers had had the advantage of long terms for payment, were to be captured and held.

It was with such thoughts in mind that the McLean-Platt and the Edge amendments to the Federal Reserve law were passed late in 1919. In reality, they were passed to legalize what was afterward termed the Foreign Trade Financing Corporation, worded in general terms, of course, so that anyone could and as a matter of fact others did organize export banks under its provisions.

But the Foreign Trade Financing Corporation was the real objective. The motive behind it all was thoroughly loyal and exceedingly farsighted. The men who engineered its passage, both from the banking world and in Congress, saw that some special provision for export financing must be attempted to meet competitors in world markets. The Edge Act was the answer, and it was a perfectly correct answer except in one matter, that is, *the Act authorized banks to hold stock in Edge bank corporations.* This was a perpetuation of the principle of pyramiding introduced with the Federal Reserve Act.

There is every reason to believe that the Edge Act did not suit the Jewish nationalists working for domination in international trade. Openly, as will be shown, they backed it; in their hearts, they damned it. It opened up the field of international credit in trade *that could not be controlled.* The door was ajar to such an extent that it let in too many real American competitors. They did not dare oppose its passage in Congress openly because the Act did exactly what they had all along been crying for. The chloroforming came later.

Plans for the establishment of the Foreign Trade Financing Corporation had been discussed at the 1919 meeting of the American Bankers Association, and they met the full approval of all who heard the report of the Committee on Marine and Commerce of which John McHugh was the chairman. Mr. McHugh, vice-president of the Mechanics and Metals Bank of New York, urged the organization of an export bank as a legitimate opportunity for American industrials to make honest money in world trade. It was put up to the association not as something out of which all concerned could grab gold profits by the handfuls, but as an institution *which would help American manufacturers, workingmen and farmers exact legitimate profit from world trade.*

The scheme of organization was laid out on large lines. The capitalization was set at $100,000,000 with a potential capacity of carrying on annually a billion dollars' worth of business. Mr. McHugh himself took the position of chairman of the Organization Committee, of which the total membership was thirty, some of them the best known bankers of the country. It was generally believed that if Mr. McHugh had gone to the bankers of the country and especially to Wall Street, there would have been no difficulty in securing all the money that was needed to finance the undertaking. But apparently that was not Mr. McHugh's idea. He desired the stock to be sold throughout the country, to the small investor, to laboring men, and especially to farmers so that each individual owning stock might have the feeling that in the Foreign Trade Financing Corporation, there was one bank that was doing something to bring profits to those who produced.

Carrying out this idea, J. R. Howard, then president of the American Farm Bureau Federation, was placed on the Organization Committee and was later slated to be an officer and director of the corporation. The name of Herbert Myrick, editor *Farm and Home,* of Springfield, Massachusetts, also appeared. There were others of similar connections. It was hoped that labor leaders would be found later who would join the movement, become officers in the corporation, and attract some of the "labor money" which was and is plentiful all over the United States if only the golden well could be tapped.

This is the way Mr. McHugh put it:

> "Believing that the development of this project will mean so much to the country as a whole, we urge the financial and practical co-operation of all members of agricultural, manufacturing, financial, and labor interests."

At the organization meeting held at Chicago, December 11, 1920, the Illinois Manufacturers' Association pledged a half-million dollars in subscriptions to stock and promised to double that amount if necessary. The American Bankers Association at its Washington meeting in 1920 passed resolutions of endorsement, the event being marked by an incident to be detailed later. Such organizations as the United States Chamber of Commerce, the National Association and Manufacturers, and the National Foreign Trade Council gave active co-operation. All this was good but not good enough in view of the program laid out. *The amount of money to be raised was so large that it necessitated active co-operation and good will of the labor and farmer elements without opposition if it was to be successful. These latter elements could not be allowed to regard it as another venture of Wall Street into speculative financing, as indeed it was not.* This point was emphasized as it should have been. "Many labor unions have large surplus funds which could be made to bring good financial returns through this corporation," said Mr. Richard Hawes, ex-president of the American Bankers Association, "and we strongly urge them to join us in this work."

Mr. Hecht Takes the Floor

A FEW wise observers who watched the evolution of Mr. McHugh's scheme desired that it might go through. It meant more than could be estimated to this country. But some of them *knew* that the Foreign Trade Financing Corporation would never function. *The chief reason for this thought was that with such a program of organization it ran counter in every step to the program of the Jewish nationalists.* The main reasons were:

1. Jewish nationalism contemplates the widening of the breach between employers and employes. That is the objective of the whole Communist-Radical movement.

2. The project of the Foreign Trade Fnancing Corporation was too democratic and too large for the Jewish nationalists to control in that form. Once organized and functioning, it threatened their position in the field of international credit and finance.

3. The Jewish financial program contemplated headquarters in Berlin. The establishment of such a corporation as the Foreign Trade Financing Corporation meant the downfall of German-Jewish interests in international trade, and the center of world's production and financing shifted to New York.

Consequently, we are prepared for the events which followed. Mr. McHugh made his report at the American Bankers Association meeting in Washington, October 20, 1920. With it were resolutions which insured the moral support of the association as it was contemplated that bankers generally would invest funds in the stock of the corporation. There were none present but that expected that these resolutions would be passed with a shout. But no sooner were they read, than Mr. Rudolph S. Hecht was on his feet.

Now, who is Mr. Hecht?

In the South and especially among bankers generally, Mr. Hecht is, as of the date this was written, the president of the Hibernia Bank and Trust Company of New Orleans, one of the big ones. He has been interested in sisal, the Comision Exportadora de Yucatan. Mr. Hecht is also interested in Japan. Along with Barney Baruch, Aaron Sapiro and Eugene Meyer, Jr., he is interested in cotton. He may be said to be the Paul Warburg of the South, a designation which he probably would take as a compliment.

Mr. Hecht said:

> "Without in any way wishing to belittle the very efficient and important work which has been done by this committee, I think it may be well for us to stop and consider for a moment whether the American Bankers Association as such wants officially to give and recommend to its membership the going into business of any kind. . . . I, for one, doubt very much that as an association we should go on record as recommending to our members any class of business, no matter how attractive, no matter how necessary it may be."

It was carefully explained by the presiding officer that the resolutions did not do what Mr. Hecht thought they did. Mr. Hecht persisted. Eventually cries from all over the room called, "Question." The resolution was put and unanimously carried.

Mr. McHugh could have taken his cue right then and there but he didn't. The limitations of his political knowledge as applied to the field of finance did not permit of a visualization of the connections between Mr. Hecht and Jewish nationalism.

Spiking the Guns

MR. HECHT did not stop. As far as the American Bankers Association was concerned, it was all over and the resolutions had passed. The end, however, was not yet. There was still something which could be done. On the following day, Mr. Daniel G. Wing, president of the First National Bank of Boston, received the following telegram. Please mark the name, as it will appear in future transactions in such a way that it may explain why Mr. Hecht turned to Mr. Wing:

> Daniel G. Wing,
> President, First National Bank,
> Boston, Mass.
>
> The very excellent and interesting report of the Commerce and Marine Committee was received with much genuine interest. Subsequently, a resolution was introduced which practically commits the American Bankers Association as such to lend its influence and prestige to a hundred million dollar export corporation to be organized under the Edge Act. I heartily approve the work of Mr. McHugh's Committee but doubt the wisdom of having the Association go into any business or endorse one Edge bill corporation as against other similar organizations now in existence or in process of organization. I would appreciate a telegram from you giving me your views on that phase of the situation.
>
> R. S. Hecht.

Mr. Hecht certainly did not stand alone, for on the same day, that is, the day following the passage of the resolutions by the American Bankers Association, Mr. Paul Warburg, who shortly afterward organized the International Acceptance Bank of No. 31 Pine Street, New York City, telegraphed Mr. Hecht in Washington, like this:

> R. S. Hecht,
> Hotel Washington,
> Washington, D. C.
>
> You remember that I was the first I believe to urge a corporation of the character now contemplated. Success will depend on operating sagaciously at proper moment both here and abroad. Without wishing to express any opinion as to merits of plan under discussion with which I am not fully familiar I strongly hold that while Bankers Association could well express its views in principle it would be bad precedent and beyond its proper functions to endorse any individual enterprise.
>
> Paul M. Warburg.

The seal of approval had been set on Mr. Hecht's efforts to block the passage of the resolutions of endorsement before the Bankers Association. They had been passed before the opposition could be organized, but here again a little study, chronologically arranged, will help in elucidating the reasons for the Foreign Trade Financing Corporation never functioning.

One month later the organization meeting of the Federal International Banking Company was held at New Orleans. Stock in this corporation was widely sold to southern and western banks. Mr. Rudolph S. Hecht was largely instrumental in its organization and became its executive director. It specializes in the export of cotton to Germany and maintains relations to a small extent with South American banks. In this connection, it is interesting to recall:

Germany purchased in 1922-1923 from the United States more cotton than all other foreign countries combined, including England with her Indian market. For these purchases, Germany paid spot cash, *gold,* in New York.

Between January 1 and June 15, 1924, Russia purchased $35,000,000 worth of American cotton, financed

(Concluded on page 14)

Reading from left to right the coins in the above illustration are as follows: A dollar of the year 1794, the first United States dollar. One "real," also called a "bit," from which we get "two bits" for a quarter. Reverse side of a Pine Tree shilling of the New England Colonies. The King of Coins, an 1804 dollar, worth about $1,200. The obverse side of a Pine Tree shilling. The reverse side of a "real." A Spanish dollar, upon which the United States currency was based.

"The Almighty Dollar"—A Brief History

By LOUIS C. KARPINSKI

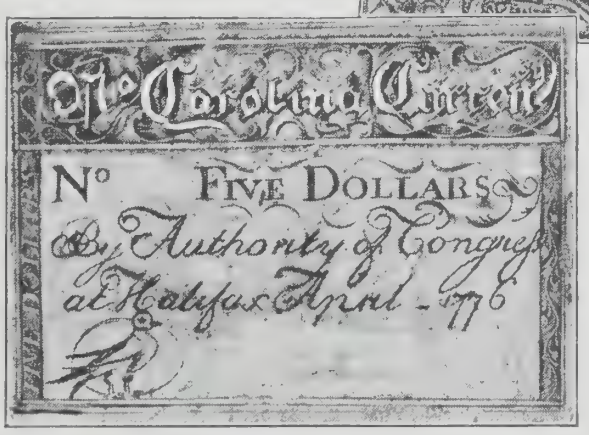
IN THE year 1837 Washington Irving interjected in his work, entitled "Wolfert's Roost," a phrase which struck the popular fancy: "the almighty dollar, that great object of universal devotion throughout our land." At the present time the dollar is no less an object of devotion at home and also the American dollar has become almost the universal standard of monetary value abroad. The story of the progress of the dollar or "thaler" from Europe to America and back again is almost a history in miniature of America.

A little more than four hundred years ago a large silver mine was discovered in the valley (German, *thal*) of Joachim in Bohemia. From this silver a large number of silver coins were struck in 1519 and these coins were called, after the valley or *thal,* Joachimsthaler, and for short, thaler. This name became in Denmark "rigsdaler" and in Sweden "riksdaler," or dollar of the realm. In English, the word in its present spelling was used in 1601 but many variations could be found even in Colonial times, as in early times people were more generous in spelling than at present. An author would not hesitate to use the same word with two or three or four different forms of spelling. So we find "dalers" in 1553, "daleiris" in 1560, "Philippes dolar" in 1587, referring to the Spanish dollar.

In the Spanish colonies so much silver and gold were produced that mints were established and the Spanish colonists had plenty of metal money in circulation. However, in the early colonies of New England little money had been brought from abroad and no metal was found. In consequence, a currency of natural products was established actually as legal tender. In Massachusetts, in 1630, Sir Richard Saltonstall was fined "four bushells of malte for his absence from Court" and about the same time an Indian, Chickataubott, was fined "a skyn of beaver for shooteinge a swine," belonging to the above Sir Richard. It was ordered in Massachusetts, in 1631, "that corne shall passe for payment of all debts at the usuall rate it is solde for, except money or beaver be expressly named." "Muskett bulletts of a full boare shall pass currantly for a farthing a peece," up to forty-eight at one time. In Canada for many years wealth was reckoned in beaver skins and even today in the extreme North such currency is not entirely out of fashion. The early deeds commonly stipulated payment in natural products.

The American Indians used wampum or wampumpeage of polished shells in long chains. The English and the Dutch made it for a time legal tender; at first eight white or four black beads made a penny, but the white man learned a process of quantity production and so the value depreciated, according to the immutable laws of commerce.

The enormous production of silver in the mines of South America enabled the Spaniards to mint large quantities of the silver dollar, largely in the Spanish-American mints of Mexico and Peru. This coin traversed the world and was the most common coin in all America from about 1650 until about 1850. In fact, such dollars were legal tender in the United States until 1857. The Spanish dollar was called the "piece of eight," being eight reales. In English, the term eight bits was used; "two bits" made a "quarter." The coins were, it is said, occasionally actually cut into "bits," but the smaller Spanish coins themselves were also long in circulation in the states.



State currency during the war—North Carolina five dollars.

The Continental Congress issued Continental paper currency payable in "Spanish milled dollars," beginning May 10, 1775. These notes were, by Congress and by separate enactments by the states, made "full legal tender." However, as there was neither metal currency nor natural products back of the bills depreciation began almost immediately. The questions of national revenue had not been settled and no stamping machine could take the place of adequate systems of taxation. The states also issued bank notes and these depreciated to an even greater extent than the Continental currency. The money for the Revolution was in part furnished by the English in expenditures for supplies, but above all furnished by France. The money and credit given by France together with her ships and officers and men absolutely made the success of the American Revolution.

The scale of depreciation of Continental currency was so intricate that practically all the popular almanacs from 1780 to 1785 and later printed the scale of depreciation for convenience of reference. The following is taken from "A Pocket Almanac, for the Year of Our Lord 1783. Boston, Printed and Sold by T. & J. Fleet."

"One hundred dollars in Gold and Silver in January 1777 being equal to One Hundred and Five Dollars in the Bills of Credit of the United States.

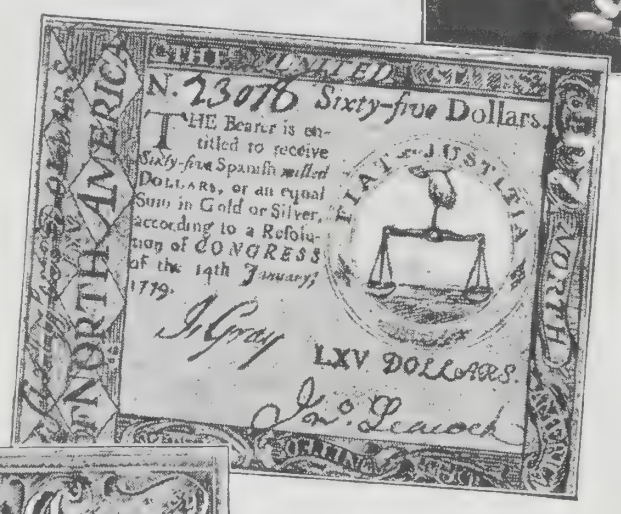
"One thousand seven hundred and seventy-seven—January, 105; February, 107; March, 109; April, 112; May, 150; June, 120; July, 125; August, 150; September, 175; October, 275; November, 300; December, 310.

"One thousand seven hundred and seventy-eight—January, 325; December, 634.

"One thousand seven hundred and seventy-nine—January, 742; December, 2,593."

Up to April, 1780, 4,000; by February 27, 1781, the dollar in coin was worth seventy-five in Continental notes. There was then a "New Emission" of paper dollars which ran the same course.

The metal coins in circulation during the Revolutionary War consisted first of Spanish dollars, then also British gold and silver, French gold guineas, Portuguese gold moidores and "joes" or "johannes," Spanish gold doubloons and pistoles, and French crowns and livres. The Continental notes were supposedly payable in "Spanish milled dollars," but there was no reserve of such dollars upon which to draw in the Continental Treasury.



THE UNITED
N. 23076 Sixty-five Dollars.
THE Bearer is entitled to receive Sixty-five Spanish milled DOLLARS, or an equal Sum in Gold or Silver, according to a Resolution of CONGRESS of the 14th January, 1779.
LXV DOLLARS.
NORTH AMERICA

Continental currency.

Robert Morris, the financial genius of the Revolution, proposed in 1782 a coinage system not on a purely decimal basis. In July of 1785 the purely decimal system recommended by Thomas Jefferson was adopted in the three following resolutions of Congress:

"That the money unit of the United States of America be one dollar.

"That the smallest coin be of copper, of which 200 shall pay for one dollar.

"That the several pieces shall increase in decimal ratio."

On August 8, 1786, Congress passed the following resolutions concerning Federal money:

"Resolved, That the standard of the United States of America, for gold and silver, shall be eleven parts fine and one part alloy.

"That the Money Unit of the United States (being by the Resolve of Congress, of the 6th of July, 1785, a Dollar) shall contain, of fine silver, 375-64/100 grains.

"That the money of account, to correspond with the division of coins, agreeably to the above Resolved, proceed in a decimal ratio, agreeably to the forms and manner following, namely:

"Mill the lowest money of account, of which 1,000 shall be equal to the federal dollar, or money unit, 0,001.

"Cent, the highest copper piece of which 100 shall be equal to the federal dollar, 0,010.

"Dime, the lowest silver coin, of which 10 shall be equal to the dollar, 0,100.

"Dollar, the highest silver coin, 1,000.

Indian wampum, the first currency of America.

"That, betwixt the dollar and the lowest copper coin, as fixed by the Resolve of Congress of the 6th of July, 1785, there shall be three silver coins, and one copper coin.

"That the silver coins shall be as follows: One coin containing 187-82/100 grains of fine silver, to be called a Half Dollar; one coin containing 75-128/1000 grains of fine silver, to be called a Double Dime; And one coin containing 87-64/1000 grains of fine silver, to be called a Dime.

"That the two copper coins shall be as follows: One equal to the one hundredth part of the federal dollar, to be called a Cent; and one equal to the two hundredth part of the federal dollar, to be called a Half Cent.

"That 2-1/4 lb. Avoirdupois weight of copper, shall constitute 100 Cents.

"That there shall be two gold coins: One containing 246-267/1000 grains of fine gold equal to 10 dollars, to be stamped with the impression of the American Eagle, and to be called an Eagle: One containing 123-134/1000 grains of fine gold, equal to 5 dollars, to be stamped in like manner, and to be called a Half Eagle."

The only coins to be made under this law were the copper coins, and the first of these, a large copper cent, was dated 1787. However, these denominations were adopted in the subsequent legislation.

Alexander Hamilton, the first Secretary of the Treasury, in 1791, in connection with his reforms of taxation and introduction of a banking system, introduced the ratio 15 to 1 and provided for the free coinage of silver and gold with a dollar of 371.25 grains. The current Spanish silver dollar was recognized as equal to 24-3/4 grains of pure gold and the ratio 15 to 1 gave 371-1/4 (or 15x24-3/4) for the silver in the silver dollar. This was the first legal bimetallic free coinage adopted anywhere in the world. The ratio of silver to gold was fixed by law at 15 to 1. Anyone bringing 15 ounces of silver to the mint would receive silver dollars (about 17-2/3 dollars); anyone bringing one ounce of gold to the mint would receive the same number of gold dollars. However, in the period immediately following 1792, when the plan was put into operation by Congress, the enormous production of silver in Mexico made silver cheaper and the ratio changed in the markets of the world to 15-1/2 and even to Mr. Bryan's famous ratio of 16 to 1. In consequence, the banker and moneychangers exported the gold dollar to Europe where the gold per ounce would buy sixteen ounces of silver. Taking fifteen of these ounces to the mint in Philadelphia the banker would obtain legal silver dollars, equal in currency form to one ounce of gold; the profit was the extra ounce of silver, approximately 7 per cent. In consequence of such transactions gold disappeared from circulation in the United States.

The disappearance of gold, with further difficulties brought about by the fact that in many foreign countries American silver was taken as equal in value to the heavier Spanish dollars, resulted in the exportation also of American silver and the importation of the foreign coins to be sent to the mint as bullion for free coinage. As the Spanish dollar was heavier it commanded a premium at the mint. When banks had to export dol-

Mussolini Appears in Role of Lion Tamer

Dictator Entertains Roman Crowd by Stunt in Cage at Zoological Gardens

By JOHN HUBERT GREUSEL

In this, the second and concluding article by Mr. Greusel, we are made familiar with the genesis of the Fascist movement, and the psychology of its leader. Further light is thrown on the inner workings of the Mussolini mind, and the motives which have guided his policy thus far.

A SHORT definition of Fascism, such as Americans could quickly understand, would be, "A gatling gun with a conscience."

While in Rome, recently, the writer saw a remarkable procession, a triumph for Fascism, in which 5,000 mayors of towns and villages in all parts of Italy were reviewed by the King. This procession which symbolized the hold of Fascism on national imagination was several miles long, and for more than an hour the King stood on the palace balcony at the Quirinal to take the Fascist salute.

Mussolini cuts all discussion very short; merely replies to all arguments: "Fascismo has risen to power from no ministerial crisis, but from a revolution; and the Black Shirts are willing, if necessary, to fight that revolution over again.

"Fascism means the collaboration of all classes to defend Italy from attacks from within or from abroad. It is a doctrine of life not of death."

Mussolini's basic idea is unquestionably to bring in a régime of law; also to define rights and duties. His motto is a gross flattery of that Germany whose military power Mussolini professed to hate from the bottom of his heart, "Deutschland über alles." Change "Deutschland" to "Italia" and you have it in three words, "Italy's cause first."

In the United States, both during and for a time after the war, Americans were urged to make a religion of patriotism.

That's Mussolini, exactly.

Scraping Away the Barnacles

IT IS easy enough to shrug the shoulders and say, "Mussolini is going too far; he is a tyrannical ruler; it cannot go on forever."

Italy, since 1871 a constitutional monarchy, has been the friend of liberty for centuries. Frederick II's parliament preceded that experiment in England, although the fact is not usually commented on by English, much less by American, writers. Our Republic has borrowed very many of our ideas of democracy from Italy's classical period. There was a Senate in Rome long before the time of Christ and the spirit of Roman law goes deeper into American life than the little school teacher ever dreams. Make a list of our customs, superstitions, ceremonies, our family interests, and you hark back to Rome.

But Italy has always been hounded by tyrants of all degree; and on account of her mixed population the Italian problem of nationality has for centuries remained for the strong to solve.

Americans should understand that it is impossible for Mussolini to make the customary appeal of modern statesman, to wit, to the Middle Class. In Italy, the Middle Class is quite new, and is snobbishly referred to as the "industrial élite." Because of the prevalence of the Feudal idea, "work is a sign of social degradation." Sons of the Middle Class as a rule desert the shops of their fathers and as soon as possible seek political jobs. Italy is filled with officeholders superficially educated to be engineers, doctors, lawyers, but who find a stool in a government bureau the height of their ambition. Up to within recent times, this stupid bureaucracy has had altogether too much to do with public life. They are barnacles on the ship of state.

Part of Mussolini's policy has been to get rid of tens of thousands of these chronic officeholders. There will be time enough for the various discordant elements in Italy to determine their individual rights; but first a law-enforcing agency must dominate the Italian peninsula. Before the Italian Government can be the servant of the state, in its broadest sense, the sense meant by the Fascists, the Italian Government must create an enlightened public opinion to back up the state.

On account of the salubrious climate, it usually turned out that the very conquerors from over the Alps sooner or later relaxed their authority and in the end were swept aside by more restless eager tyrants, who in turn went the same way. A curious condition resulted. In Italy the passionate desire for liberty has always been associated with violence. Italian friends of liberty, in all centuries, have come to believe that the highest purpose of the ruler is to make his enemies tremble. The point of honor has been, then, to preserve order with the iron fist.

Italy Against the World

A HEROIC band of Italian patriots, Cavour, Garibaldi, Mazzini, and others, have within the last half-century succeeded in developing national belief in "united Italy." Mussolini is carrying on, and though his methods are rude he is a shrewd prince and his work is not in vain.

Mussolini is frankly, fearlessly and by deliberate choice working for Italy against the world. His is not the strength of the stupid peasant who takes it out in beating his dog, till the dog fawns at his feet. There are millions of men of that type in this world, men who accomplish nothing by their work except frighten a dog. Too much of that type of leadership in Italy, all down the centuries, accounts for her fall from freedom.

"I have raised up one from the North, and he shall come: from the rising of the sun shall he call upon my name; and he shall come upon prices as upon mortar, and as the potter treadeth clay." Isaiah wrote that bitter truth many centuries ago. Without a leader, the people fall into the ditch.

Mussolini knows well Italians must be trained to freedom and self-government. His plan is somewhat like that of Frederick the Great, who as he walked about Potsdam or in the rural regions cracked peasants over the back with his cane, saying in a loud voice, "Get to work!"

S. E. BENITO MUSSOLINI.

Remembering Caesar

MUSSOLINI'S keynote: "Force and right govern everything in this world; force till right is ready."

Also this: "I must bring this nation under a single rule, superior to all sects or factions. The late war has made Italy into a people, but the task awaits to make of this nation a state. An arduous and difficult undertaking! But life is not worth living if one does not face such tasks. Italy must be disciplined and armed. You must not believe in the humanitarian ideals of the pacifists. Above all else, Italy must have a powerful army, navy and air force."

However, there is a raw side. The recent dastardly assassination of Matteotti, whose mangled body was found hidden in a villa near Liuggi, brings up anew the much-discussed question, "Has Mussolini run his course?" Linked with the murder of the Socialist member of the Italian chamber were the names of Aldo Finzi, Mussolini's secretary of the interior, Filippo Filippelli, Fascist editor, Cesar Rossi, head of the Fascist press-bureau. Matteotti had threatened to expose alleged bribery and corruption in Mussolini's government, more especially oil scandals. To stop the disclosure the abduction that ended in murder is said to have been planned by the Fascisti. In rebuttal, Prince Caetani, Italian ambassador at Washington, says: "Fascism will come out of this storm stronger and more respected than ever. The supposed murderers call themselves Fascisti, but were unworthy of such a name for they violated all the ideals of Fascism."

Mussolini's problem is attractive to him, because of its immensity. He conceives society to be corrupt, undertakes to reform its very soul. In some respects, Mussolini is a fanatic. But for that matter, all first-rate leaders have in them a streak closely allied to madness. Julius Caesar suffered from epileptic fits, and so did Napoleon; Cromwell was a fanatic in religious intolerance, but knew enough to keep his powder dry; Mohammet taught faith with the sword; Bismarck expected, when he spoke, that his generals should wheel like an ensemble drill of circus horses; while the fanaticism of Old John Brown in his philanthropic desire to free the slaves has been charged to an unbalanced mind.

Mussolini's enormous appetite for order, discipline, success, takes on a peculiar form closely allied to personal vengeance against those who differ with him. He torments all classes by incessant mutterings of dissatisfaction. He would burn a city, sell its inhabitants into slavery if he thought by that means he could rouse Italians to an ardent passion for a united state.

"Higher than the rights of man are the rights of the state," is his severe proclamation. Also this: "It is more important in the life of the state how citizens act than what citizens have. All parties should be absorbed into the state."

This is a direct throw-back to the divine right of kings, as expressed by Louis XIV, "I am the state." But Mussolini is too shrewd to go that far, in his own behalf. In other words, before him ever is the lesson of Caesar who was assassinated primarily because he represented in his own person all the functions of the state, religion, military, legal, social.

Scene in the Borghese Gardens

ON THE contrary it may not have occurred to Mussolini that mankind loved, hated and had other private interests, long before the state was known, will go on loving and hating centuries on centuries after the present form of state has passed into oblivion. For there is no page in written history which decrees that the state as at present known is the final form of all political intelligence, much less that it represents the highest hope of mankind. Like everything else, the state is changing and although Mussolini seems not to know it, his very audacity presses new ideals to the front, in proportion as his overlordship discloses hate and tyranny. He wants Italy to find her soul, and Italy will, but at that it may be another sort of soul than Mussolini ever dreamed.

Curiously enough, the last glimpse I had of Mussolini was at the Zoological Gardens in famous Borghese villa park. It is late in the afternoon; crowds have gathered, as though to enjoy a program of pleasures.

I learned that for a diversion, the dictator of Italy enters the lion's cage several times a week to play with the lion's cub. Mussolini presently appears and is instantly recognized; a cheer goes up; he bows and smiles his acknowledgments.

He is dressed in smart riding breeches, black cutaway coat, derby hat, cream-white gloves of strong material, carries a riding whip. The man has a fine youthful figure, is wonderfully athletic, and his animation is supreme.

At first glance, you think it is Rodolf Valentino doing a movie stunt. In fact, there is a strong resemblance between the handsome athletic Mussolini and the movie sheik.

Mussolini wastes no time. He proceeds to roll the lion cub over, opens its mouth, and makes the cub snarl. This snarling of the little lion causes Mussolini to laugh, as though he enjoyed mastering the beast with the sharp teeth and long wicked claws. With boundless energy, the cub fights back, but Mussolini is plainly master, a rôle in which he delights. The spectators crowd forward, highly entertained, yet filled with apprehension lest the lion will suddenly spring on Mussolini, wound him to death.

Here then you have the whole picture. The lion is the people of Italy, the ruler is Mussolini. Anything he does to make the lion respect authority, whether a caress or a sharp blow on the nose, is justifiable because the lion is at heart wicked and treacherous.

Mussolini is a solitary, a tragic figure with the weight of Italy on his shoulders. When Rome is sleeping, the man with the burning eyes and strong jaw is walking the floor trying to answer questions that even he is unable to solve.

Wheel Will Turn Again

AS A mystic he makes a religion of the state, but as one of the shrewdest, most practical realists since Caesar's time, Mussolini rattles his sword, boldly announcing to the world, "Italy is not concerned with what others think; she will settle her own problems in her own way."

One day, Mussolini will die and then Italy will have to find another leader, will try new theories; for all history discloses the evolution of political, religious and social forms.

Mussolini, like all strong men, would reply to these words, "You are wrong. I have shown Italy the way to peace, prosperity and happiness. I am on the winning side and my work is permanent."

We discount the enthusiasm that sees in each reform the dawn of the millennium, but cannot help admiring Mussolini for the reasons we have set up in this study of his remarkable traits, personality and character.

Italy's cycle of progress toward democracy has barely begun. We must not lose hope. Democratic evolution though painfully slow goes on ceaselessly down the centuries. The fact that Italy exchanged her old monarchial ideas for the menace of the man on horseback, was to be expected.

In the end, although it is furthest from his thoughts, Mussolini's experiment in overlordship will actually hasten the cause of ultimate democracy for Italy. The wheel has turned before, and the wheel will turn again.

Mr. Ford's Page

THE old idea of business, that it consists of one man getting the better of another man, is no longer acknowledged as businesslike even by those who practice it. In this as in other matters, however, human professions run ahead of human practice; there is yet too much of the old idea in business, although progress toward a better practice is much greater than is sometimes credited.

The American idea of business is based on economic science and social morality, that is, it recognizes that all economic activity is under the check of natural law, and that no activity of man so continuously affects the well-being of others as does the daily activity of business. Business has scientific, humane, moral, social and political consequences all in one—because of inherent elements which cannot be separated from it.

In former times business practice was determined by three principles: first, that the greater "the circulation of trade," that is, the more hands a transaction passed through, the better for business in general. Any short-circuiting of commodity to user was treachery to trade. Second, the guild monopoly which compelled the tea store to stick to tea, the cloth store to cloth, the bread store to bread; forbidding bread and tea to be sold together. This was but an extension of the first principle of dividing an occupation among as many people as possible. Third, prevention of service to the public by warning them of another merchant's shoddy, or by selling better goods at lower prices. Business under these principles was a close corporation with the public as the butt of its activities. The best that can be said of it in those times was that quality of goods was uniformly high; substitution was unknown.

The whole trend of modern trade has been away from these principles. If the same service can be rendered by two persons (say manufacturer and retailer) which was formerly rendered by nine (the cloth-maker, the factor, the woolen-draper, the shopkeeper, the tailor, with four carriers between them), and seven charges upon the ultimate user of the cloth thus eliminated, service is undoubtedly improved and life is made more efficient for all concerned. If instead of four stores—the tea store, the jam shop, the baker's shop, the greengrocer's stall—with their four burdens of upkeep to be charged against the public, they are combined in one general supply store, the guild system may suffer but public service is helped. And after all, business does not exist to support business, but to serve the people with what they need. And so with competition—the best goods and the best service win. Competition in prices means nothing; all genuine competition roots in quality and service.

These departures from the old principle are now established in modern business. Waste of unnecessary costs, waste of unnatural divisions of duty, these have been eliminated. But not without objection, and certainly not with the full benefit of these changes handed on to the people. Internal efficiency of modern business means nothing if the benefit is retained within the business; the whole genius of efficiency is to flow on until the last consumer feels the life of it. Otherwise the economic body begins to suffer from disturbed circulation.

The buyer and the seller are always quick to see the benefit to be derived from the curtailment of waste. The buyer notes the benefit in the price he has to pay for an article efficiently made; the seller notes the benefit in the easier flow of commodities to the public that needs them.

But the professional labor leaders who would set up an artificial class of producers (as if both buyers and sellers do not comprise the total of producers) insist that this efficiency makes less work, fewer jobs, decreases the rate of employment. Their logic is that where two men conduct a process that formerly used eight, six men are thus left without work.

Of course this has been proved over and over again to be unadulterated fallacy. Take it in England at the present time. Hand-in-hand with English unemployment goes the preaching of the false theory that doing less work results in more work to do and more men employed. On paper, perhaps, it should work out that way, but in life it works out differently. The trouble with all such theories is that they seem to blue-print very well, but actual life upsets them. Russia is an example.

So, the British bricklayer, with kind intent toward his fellow bricklayer who is out of a job, is easily persuaded that if he will only lay half the number of bricks that he formerly laid, the bosses will have to hire his out-of-work friend to lay the other half. That is, he thinks he is creating two jobs where only one existed before, and so decreasing the evils of unemployment.

But what is it he really does? He increases unemployment by making bricklaying so expensive that few can afford to build houses. Instead of making a job for his friend, he more than likely loses his own job through "slackness in the building trade." Though England cries for houses, few houses go up. Workingmen's houses do not go up at all, the reason being that bricklayers will not lay bricks enough to make an honest day's work, and thus double costs are imposed upon a house, with the result that the workingman who should inhabit it with his family cannot afford to. To hold back in any service is not to increase opportunity for others, but to destroy yours and theirs too.

THE British bricklayer thinks that if he lays only half the number of bricks he formerly did, the bosses will have to hire his out-of-work friend to lay the other half. He thinks he is increasing the number of jobs and decreasing the rate of unemployment. What he really is doing is increasing unemployment by making bricklaying so costly that few can afford to build houses. Instead of making a job for his friend, he more than likely loses his own job through "slackness in the building trade." To withhold service is not the way to create or increase opportunity, but it is a pretty sure way to destroy it. England cries for workingmen's houses, but the false notion that less work makes more work holds up building. Natural law is more work done, more to do all round.

It is perfectly easy to see this when the English bricklayer is the example: the facts in his case are there before us, they simply cannot be evaded. They illustrate the tremendous hold which an economic lie can get on the mind of otherwise honest men. The way for the English bricklayer to make work for all his fellows in the trade is to make housebuilding easy, to create a deluge of housebuilding, to make England joyful with the ease with which workingmen's cottages can be built with free workingmen's labor. There will be no question about wages where there is labor. It is not wages that hold enterprises back, it is service withheld.

But when these same principles are applied to the business end of affairs, agreement is not so easy to get. It is clear what the bricklayer should do, but when the same principle is applied to the front office, a change in temperature occurs. There has been so much talk about the duties of men that we have forgotten to talk about the duties of managers. Counsel has been so often directed at labor, that capital's need of the same has been forgotten.

All the devices of watered stock and hosts of absentee-dividend-drawers are parallels in waste to the practice of dividing the job among twice as many men as were necessary. The manufacturer who gives the public as little as he can for its money is a parallel to the bricklayer who will handle only half as many bricks as he can. The abuses and fallacies which show up so sharply in the handling of material by labor, exist also in managerial spheres. Only it comes out more sharply in the handling of materials by labor, for there is something naturally, inherently, fundamentally honest in materials and in work. The service which ought to characterize the making of the commodity ought also to characterize its sale to the public.

And there is no lesson taught to labor which capital does not need to learn.

They are both in the same world, on the same mission and subject to the same laws and penalties. Recognition of this basic truth is part of the American idea of business.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Neither a LaFollette Nor a Dawes

THE recent presidential campaign brought vividly home to the minds of observers the fact that in this country education of public opinion on economic matters has been left largely to the propagators of discontent and anti-Americanism on the one hand, and defenders of special privilege on the other. Fallacies that were exploded a quarter of a century ago made their reappearance between the conventions and the election, and far too many people credulously absorbed them as Gospel truth. Not so many, perhaps, as might have done so 25 years ago, but more than is reassuring in this enlightened age.

It is always a question who is responsible for these misconceptions of our fundamental economic life—the people themselves, or those who diligently plant false ideas. And when the term "people" is used, certain distinctions must be observed. There are some races which instinctively know that generous promises of something out of nothing are false. The northern white races have never suffered themselves to be led into serious economic trouble by the impossible promises of would-be leaders whose chief asset was a readiness in spoken address. There are races, however, which are constantly falling into the traps of enticing demagogues, constantly reaping the bitter consequences thereof, but never seeming to grow much wiser as a result of their experience.

Mixed in with our own people in this country are multitudes whose minds offer ready soil for every kind of fallacy and every incitement to upheaval. For example, Bolshevism could no more take root in the American type of mind than a grain of wheat could take root in a lava field, yet in a country like our own where there is so large a representation of alien-mindedness, it offers a soil for all poisonous ideas. Bolshevism entered the United States, beyond a doubt, but it was not the American mind that succumbed to it.

The main responsibility for fortifying the people with facts rests upon those who are in a position to teach the people. Demagogues are like scavengers who infest the waste places. If we have been so intent on production in the United States that we have forgotten to equip our people with defenses against the insidious attacks of the demagogue, the waste places of the public mind will certainly be infested by peddlers of every possible fallacy. We must disseminate sound economic knowledge, and we must do so honestly—not stopping short of where economic knowledge challenges the soundness of some of our accepted practices.

The last campaign showed that education of the American mind, the creation of American-mindedness on vital questions, is a duty sadly needing to be performed. It cannot be left either to a La Follette or a Dawes.

Britain's Reaction

THE inevitable has taken place in Great Britain. The political pendulum has swung back to where it was before Ramsay MacDonald got his great chance to show what Socialism could do for the country. If MacDonald had stuck to his original program for healing the ills of unemployment and lack of housing he and his party would have been in power today, but when he followed up his Russian pact by sheltering a seditious penny-a-liner under the egis of the government, it was too much for the British mind. The announcement of the plot hatched in Moscow for Red revolution in Britain was the last and decisive blow against the MacDonald administration.

It is trite but true that "a man is known by the company he keeps," so also are governments, and the Laborites' hobnobbing with the Bolsheviks sent warning shivers up the spinal column of John Bull.

Lady Astor, after her victory at the polls at Plymouth, tersely expressed the situation as follows: "I attribute my success to the fact that Great Britain prefers the Union Jack, just as good Americans prefer the Stars and Stripes, and steady progress rather than revolution and socialism."

Extremists are not permanently successful anywhere, and when destructive forces are at work to undermine a country's constitution and violate all the canons of stable government it is time to do some "redding up." This the people of Britain have done. Had MacDonald in his methods of statesmanship made use of that "ca canny" policy which the Laborites have been so fond of applying to industrial production, he might have steered a clear course. He has had his chance, and not outer opposition but inner incompetency has been his undoing.

The victory of the Tory party, however, does not mean a victory for reaction. The old Tory party, creator and protector of special privilege, is dead. In its place stands the party of the new conservatism which holds that all the managerial ability which created the classes should now be placed at the service of the masses. What Socialism would do but could not, what the old Tories could have done but would not, the new conservatism of Stanley Baldwin stands committed to do. In the Socialist party idealism was divorced from ability; in the Tory party ability was divorced from idealism; in the new conservatism both combine in a policy of progress along sound and constructive lines.

The British election is not primarily the triumph of any party as such; fundamentally it is a sign that the British people, after "shopping round" among various possibilities, have finally settled down on a sound and practical basis.

Guns and Gunmen

A SUGGESTION that some form of prohibition should be applied to the use of firearms in the interests of public safety has attracted considerable attention in all parts of the country. While there appears to be a consensus of public opinion in favor of restriction in the use of firearms sufficient to lessen materially lawlessness and to safeguard human life, there is a section which evidently takes lawlessness as a matter of course, and the use of firearms by all and sundry as an institution which cannot be abolished, a sort of necessary evil that must continue because it has to combat evil.

Here we have truly a vicious circle; a state of matters as senseless as it is futile. The disarmament of individuals is a problem which awaits solution like the disarmament of nations. The remedy seems as hard to find in the one case as it is in the other.

A Transformation

MANY will remember that the first blue-blooded aristocrat to float himself as a limited liability company was that celebrated Gilbertian creation the *Duke of Plaza Toro,* a grandee of Spain. The comic opera writer little dreamed that his merry quip would be transformed into a reality in the course of a few short years. The principal cause has been the World War, that great leveler of social mountains. The burden of consequent taxation has affected the dukes and earls in Great Britain as well as the common people, and they have found that to be the owners of vast estates, the income from which does not cover overhead expenses, is by no means an ideal position.

The Duke of Buccleuch was the first to turn to the *Plazo Toro* scheme to find relief. As a preliminary he published duly audited accounts showing that taxation and managerial expenses had risen nearly fourfold from 1912 to 1920. The duke and his son, the Earl of Dalkeith, then floated themselves as a private joint-stock company.

Their example has been followed by other noblemen threatened with financial extinction, among them being some of the holders of the largest acreage in the United Kingdom.

It was Lloyd George who started the game of despoiling the scions of aristocracy through the medium of the Chancellor of the Exchequer, and so zealously did he follow this line of action that a lot of the fun was taken out of the distinction of being the titled proprietor of hereditary acres. But some of the lords and dukes have turned the tables on the former premier by publicly making known what they had hitherto guarded as a secret, namely, that they themselves belonged to the ranks of the unemployed, and were unable to make ends meet.

Pacifism Is Neither Peacemaking Nor American

IT IS unfortunate that of recent years the Y. W. C. A. has become the harborage of unbalanced radical feminine minds. Part of the program of infiltration of alien ideas into the mind of American women has been carried out through Y. W. C. A. activities in a number of instances so great that it amounts to proof that the revolutionary radical program among American club women has found a rather strong place among the newer Y. W. C. A. leaders. Local instances abound in all great cities. The propaganda, as usual, enlists the humane and Christian sensibilities of good women, whose emotional response to high and holy idealism blinds them to the ultimate end which their idealism is meant to serve.

The public prints report that the Y. W. C. A. refuses to join in the observance of Education Week—November 17 to 23—as requested by the United States Bureau of Education, the assigned reason being that somehow Education Week is intended to destroy world peace and prevent international cooperation. An examination of the suggested program for that week does not bear out the contention:

Monday, November 17, is Constitution Day, with its slogans—"Ballots Not Bullets," and "Master the English Language." What is wrong about that? Of course, the English language is dangerous to revolutionary radicalism. It is a language that compels thoughts to be spoken out clearly.

Tuesday, Patriotism Day, has its slogans—"Liberty, the Opportunity to Do Right." "The Commingled Race Called American." "The Common School, the Bulwark of American Liberty." The only objections possible to these would have to arise out of anti-Americanism.

Then come School and Teacher Day, Illiteracy Day, Physical Education Day and Community Day, with Sunday bringing the observance of the week to a close as For God and Country Day, with its slogans—"Religion, Morality and Education are Necessary for Good Government." "A Godly Nation Cannot Fail." "The Educational Triangle: The Home, The School, The Church."

This is a pretty thorough American program for the schools—so American, indeed, that opposition to it attracts attention. One "peace authority" objects because the American Legion is mentioned, among Rotary and Kiwanis clubs, Parent and Teachers' clubs, Civic Improvement Associations and Labor unions, as possible sources of speakers and other cooperation. This "peace authority" is Reverend John Haynes Holmes who will regard as a compliment the statement that his name is to be found wherever the white flag is raised in time of war or the red flag in time of peace. He feels that the inclusion of the American Legion will be "unfortunate in its effects on large sections of public opinion." Not large sections, Mr. Holmes, but very noisy and disloyal sections, to whom men like yourself lend a respectability that even you cannot long maintain for them! The only specific suggestion made concerning the American Legion as a co-operating agency in Education Week is found on page 22 of the pamphlet of suggestions:

> "American Legion.—Give demonstrations of the care of the Flag, and instruct the citizens and school children in its history, its meaning, and our duties toward it."

It is going pretty far when the Y. W. C. A. and men like John Haynes Holmes line up together in petulant objection to the Americanism of the Constitution and the decent treatment of the Flag of the United States.

Ich Dien

ICH DIEN, which means *I serve,* is the motto of the Prince of Wales. It is a motto which commends itself to the American mind, which recognizes that on the spirit of service depends the well-being of all.

In his personality the prince combines the blood of the ancient Celtic kings, that of the fair-haired vikings, and that of the sturdy Anglo-Saxons, a blend of the best characteristics of the European races, which has endowed him with mental and physical energy of a high order.

The Prince of Wales sought to know something of American ways and American methods, and his wish has been amply gratified; he sought to become acquainted with the democratic spirit of the people of this country, and found it congenial. He has followed in the footsteps of the men of his own race who blazed the trails in America, and has learned that they too had for their motto *Ich dien.*

The Busy Beaver—Nature's Greatest Engineer

A clever piece of tree-felling performed by beavers. Note how clean the cut is made.

Furry Creature of the Wilds Shows Uncanny Ability in Felling Trees and Constructing Dams in Difficult Places

By DONALD HOUGH

An ash tree, seldom tackled by the beaver. This one measured three feet across the base.

SPLASH! Not more than three rods in front of your canoe—and it seems to you, as your heart twitches violently, that a meteor must have fallen from the darkening sky . . . . In another instant, realizing that it was merely another beaver, you regain your serenity and peace of mind. You are impatient with yourself, for you know that the place is full of beaver. You can hear them slapping their tails on the water far ahead of you; you had to lift the canoe over a beaver dam not a half-mile back.

The dark banks of the little river slip past, the spruce trees cutting a jagged sky line against the dimming light of the heavens. No sound disturbs the silence of the Minnesota woods save the intermittent dripping of water from your paddle. Your thoughts revert to home, to your last meal at a table, to—

Splash!

Not three rods in front of your canoe; and it seems to you, as your heart twitches violently . . . .

The beaver, aside from his relation to the fur market, to collars for coats and to the hats our great-grandfathers wore, has a status so peculiarly his own among the creatures of the woods that he seems almost to embody a distinct species of life all his own.

Among the people who frequent the woods, he is regarded with mixed emotions. He is one moment a despised enemy; the next, a warm friend. One evening he disturbs your peace of mind with his boisterous splashing and makes of himself a pest, whose visits to your vicinity should be discouraged. Again, when you are alone in the woods, sitting in your solitary tent, the omnipresent beaver cheers you—he is your only friend. One day he floods your arduous trail with water halted in its natural course by one of his dams; another day, in the course of an upstream struggle in which you must pull the canoe through riffles and portage it around rapids, you come to a beaver dam and with a sigh of relief you launch your canoe and paddle in peace and comfort across the resultant pond.

Beaver have long been given credit for more than ordinary intelligence. A calm appraisal, however, discloses the fact that the animal is a rodent, not a demigod, and is probably about as intelligent as any other rodent, of which the common house rat is an example. The instinct of the beaver calls for the construction of dams, a sense of water levels, an understanding of the principle of drainage, erosion, general topography and other fundamentals of the engineering art.

The beaver does these things, but he could never solve the problems of the house rat, nor of the squirrel, nor in fact could he accomplish anything foreign to his intimate mode of life, and since this is the test of intelligence, there is no doubt but that the beaver does his work from instinct—a fact which does not detract from his personality, and makes him an even more interesting subject for study.

A beaver dam across a small stream in Northern Minnesota. The United States Forest Rangers came across the dam and pond while making a mile portage through the woods.

The forests of Northeastern Minnesota constitute one of the last real strongholds of beaver in this country. The region is settled only around the edges, the interior remaining a waterway labyrinth in the midst of a forest that is virtually primeval. The dams of the beaver are found in every possible location, from the smallest creek to the bed of a good-sized river. They range in size from a few sticks thrown across a trickle of water for no apparent reason to dams a dozen feet high, scientifically constructed to harness a considerable volume of water. Some of these larger dams, and some of the larger houses, too, are so old that they are overgrown with vegetation, even small saplings, assuming the appearance of a freak formation of land. Some of these are said to be hundreds of years old.

Of particular interest, however, are the dams that are now in process of construction. They are found in every stage, from the preliminary falling of a tree across a stream to a completed dam, carefully chinked with mud: a work of art.

When first made the dams are loose in construction and the water flows between the sticks at will. This is to avoid heavy pressure on the dam while it is still weak. When the framework has been completed, and the pillars of strength set, the filling in begins. This is carefully done so that the water pressure will be directed against the whole dam, and not against any special part of it. Finally the finishing touches are put on, the water completely harnessed, and controlled by means of a small opening in the top of the dam. This is done instead of letting the surplus water escape over the top of the whole dam so that a constant control of the water can be maintained, thus enabling the beaver readily to shut off the escape of the water in time of drought by closing the opening. It also provides the opposite control in time of flood.

Selection of a site for the dam demands what is apparently human intelligence. The drop in the water level, that is, the bed of the stream, must be accurately judged so that the resultant pond will be deep enough to preclude freezing to the bottom in the winter. The lateral contour of the stream bed and its immediate valley must also be accurately considered, else the water from the pond, while perhaps held back enough by the dam itself, will be in danger of spilling over the sides of the stream bed.

In spite of the intricate details the beaver seem to master with ease, they are not infallible. There are many examples of failure in the forests of Minnesota. There is a partly finished dam across a rapid in the Isabella River in the Superior National Forest which was abandoned after many years of hard work because the fall of the river bed was so steep that a dam high enough to form a pond could not be constructed. A forest ranger near Ely watched a colony of beaver work on a small creek near his station for three years. They felled a great many trees and tried to make a dam with the branches. But something was wrong; the pond would not stay in place, and the beaver left.

Aside from his engineering ability, the beaver is a distinctive animal of the forest in two other respects. First, the cutting down of trees with his teeth; second, the use of his tail as a signal. The little animals cut down trees ranging from a few inches to a foot and a half in diameter. They show uncanny ability in so felling them that they fall in the right direction, escaping the branches of other trees, or falling into the river. The trees are cut to bring the tender upper shoots within reach so they can be cut up and used for food and for construction purposes.

Perhaps the most amusing trait of this tree-destroying little animal is his manner of bringing the flat surface of his tail down smartly on the water at the slightest provocation. To do this he must dive, the two actions occurring simultaneously. Both acts are done so rapidly that the swimming beaver seems suddenly to have disappeared in an explosion of water, not unlike the genii of the fairy tales. If the beaver is extraordinarily agitated, he will repeat this performance as rapidly as he can recover himself.

He uses this signal to summon other beaver to his assistance, and to drive away intruders, probably by scaring them. Men are not the only cause of such a demonstration. I have seen beaver become excited when deer and moose approach the water to drink. Once I saw a beaver become greatly agitated, and to splash his tail as fast as he could dive and recover himself, when a deer approached him. Yet he had seen me, and had watched my movements for some time, never once becoming alarmed.

The beaver may be intelligent, they may be mere instinctive automatons, but they have carved for themselves a peculiar niche in the animal hall of fame, and remain today the dominant personalities of the woods.

When America was first entered by Europeans, the beaver was found inhabiting almost all the woodland streams of the whole northern continent, from the Arctic Circle down to Central Mexico. Its temperament and manner of life made it an easy prey and prevented it from adapting itself to changed conditions as did its neighbor, the muskrat. It rapidly disappeared, therefore, wherever civilization progressed or trapping was systematically carried on, and now no beaver are to be found south of the rivers that flow into Hudson Bay, except in the northern parts of the Rocky Mountains and in a few remote and scattered places like the forests of Maine and the Lake Superior region, where they are more or less protected by law. A few survive, nevertheless, in the wild ranges of the southern Alleghenies and along the borders of Mexico. The principal use to which beaver fur was originally put was for the making of hats; and it is probable that had not the method of making hat-coverings from silk been discovered, the animal would long ago have become extinct.

A beaver house, on the shore of Lake Ogishkemuncie, Superior National Forest, Minnesota.

A beaver cutting near the Jackpine Trail, Superior Forest. The attempt to form a pond here failed.

Chinese Civil War May Last for Years

American Woman Relates Further Experiences in the Area of the Fighting

By MRS. L. M. CRAMER

The further experiences of Mrs. Cramer in Shanghai are given in this, her second article from the war zone in China. Some idea is given of the causes which led up to the conflict, and there is an entertaining account of the adventures of some Americans who went out to see the fighting at close range. Since Mrs. Cramer wrote this article the field of hostilities has been considerably widened, and the people of Shanghai have been brought into more intimate contact with the firing line.

Shanghai, September 24—

THREE weeks ago today the first shot was fired in the war between the provinces of Chekiang and Kiangsu in China. In the beginning people said it would be all over in a few days, with nothing settled, or that it would become a general civil war, perhaps lasting years.

In the north, the war lord of Manchuria, Marshal Chang Tso-lin, of Mukeen, a Chekiang sympathizer, has declared war against the Chihli party in general, naming President Tsao Kun and Marshal Wu Pei-fu in particular, and the peaceful province of Shansi has already been drawn into this conflict.

In the south there is the spectacle of Dr. Sun Yat Sen at war with the Fukien government. Out in the west in the Szechuen province, where after eleven years of intermittent warfare there seemed to be signs of a dawning peace, there is now renewed activity. It looks as though within two months all China will be involved. The chances are that if it is, there will be nothing accomplished except a hundred thousand new graves dotted over the farming country of this queer land.

All the war lords are talking in high-sounding, flowery language of their mission to unify China, a China which shall be "prosperous and peaceful." Each war lord proclaims himself the chosen of the gods to bring about this situation. "Peace by Force" seems to be the slogan throughout this former empire. And it never was less peaceful, less unified.

What makes things still more serious is the strong anti-foreign feeling that is springing up all over China. At Pekin it reached the stage of handbill propaganda on the eighth of this month, when handbills were printed and distributed throughout the legation quarter. These bills, which may mean nothing, and again may mean much, are as follows:

"We Chinese citizens apply to you foreign diplomats and citizens and warn you that the Chinese people cannot tolerate any further acts of violence and insults of your governments.

"Our patience has come to an end. Woe to you if you will not awake in time and not (sic) give up predatory treaties which strangle China. Today the Chinese people protest against the protocol of 1901 as a source of violence and insults to China. We demand:

"Obedience to our laws.

"Retrocession of concessions at Shanghai, Tientsin and other places.

"Restoration of customhouses.

"Stop robbing our customs revenues.

"Don't strangle with your customs tariff our young industry.

"Remove your troops from Pekin. If you are not thieves and robbers what reason have you to fear the Chinese people?

"Don't interfere with our internal politics and struggles that are going on in China. This is our own affair. If you don't like it go away from our country. We don't keep you in China by force; think it over before it is too late.

"The British, Japanese, American, French robbers and bandits be careful, the time of redress is near.

"Either stop the policy of violence and give up the treaty of 1901 or the high walls of the legation quarter and the troops will not keep you safe.

"Since the legation quarter is a part of our city it must be governed by our laws. We cannot have any Chinese being looked upon as a defenseless dog in the legation quarter."

For the polite Chinese, this note of warning is very serious, though the reader up in Oshkosh, Wisconsin, U. S. A., may see nothing very threatening in it. To the old foreign resident in China the warnings and the rumblings and the veiled threats that they used to receive before the Boxer Rebellion are all brought vividly to mind, and no man can tell where all this will end, or when.

While all the war lords involved in this war insist it is not a war against foreigners, it is a significant fact that a strong anti-foreign feeling is growing from one end of China to the other.

At the beginning of this war it rained and rained and rained, and those who pretended to be in the "know" among the foreigners smiled, and said: "It won't last long if this rain keeps up, for Chinese soldiers won't fight in the rain." If you have lived in China you will recall that in this respect a cat and a Chinaman are somewhat alike—neither wants to go out in the rain.

Can Fight in the Rain

THAT the Chinese soldier went to war intending to protect himself from the rain that might fall was evidenced by the fact that every soldier had his oiled paper umbrella strapped to his back. But although for more than a week after the first shot was fired it rained almost constantly, the Chinaman fought on. Thousands of Chinese soldiers have been killed or have died of their wounds since this war began, and other thousands have been wounded.

Of course, there have been many near-tragedies that are now looked back upon as huge jokes, especially among the foreigners. Presumably under the impression that a Chinese war must be highly amusing, some foreigners have gone too close to the firing line, and escaped death by the miracle of inches.

The American novelist, Peter B. Kyne, creator of lovable old Cappy Ricks, came to China just about the time the war broke out. He had been planning the trip for twenty-five years, he said. Accompanying him were his wife and his private secretary, Miss Ruth Ohlson. Carl Crowe, one of the best-known Americans in the foreign colony here, invited them all to take a drive in his car. They would all go out toward where the Chekiang soldiers were encamped, and see them with their birds, their fans, and their paper umbrellas.

Mr. Kyne had another engagement, but the other three, together with the Chinese chauffeur, set out one afternoon. In a short time they arrived in the village of Liuho, where since there has been the bitterest fighting of the war. The party decided to get out of the car, and see the old town right. They heard popping sounds about them, but Mr. Crowe dismissed it with the one word—"firecrackers." But suddenly they noticed a soldier near them duck to cover, then another and another. Their chauffeur got out of the car with dispatch and crawled underneath it, and neither coaxing nor threats would dislodge him.

The three foreigners started down a narrow street in the direction of a foreign hospital. This they did about the time they discovered that the "firecrackers" were really infantry fire. The gates of the hospital were closed and barred when the party reached them, and just then hell broke loose in the shape of heavy artillery fire with shells bursting all about them.

Off across a paddy field, ankle deep in mud, they started in the direction of Pekin, or Leningrad. They tried to go with dignity, but when a "dud" buried itself in the soft mud, within ten feet of Mrs. Kyne, they dropped ceremony and ran as fast as they could in the sticky mud.

Refugees Flee to Shanghai

THEY ran for four miles before they came to a high-road and were picked up, together with some Chinese wounded, and brought back to town by an American who had also driven out to see how a Chinese war looked at close range.

The No. 1 boy at the boarding house on Avenue Joffre, where I am still sheltered, with his hand over his heart, said:

"Missie, I think the fighting is very bada. Belong why? So some Chinaman may feed his greed for more land and more power. My think very bada, and my country suffer very much. More better all live in peace as Confucius willed. Today Confucius' birthday, and still Chinaman fight."

If all the Chinese were like this very delightful, very charming No. 1 boy, China would indeed be happy, and contented. He is of the old school—polite, gentle, honest, gracious—in short, a gentleman whose bearing would be a credit to any country. He is a type of his race fast disappearing.

Refugees are still pouring into Shanghai till the sides of the city are fairly bulging out with her unwonted hordes. Many missionaries who stayed at their posts are now being forced to vacate them because of fighting in their very front yards. Some of these are making their escape in chairs, in ricshas, and in wheelbarrows; some are walking, carrying all of their belongings they can pack upon their backs. One of those who escaped in a wheelbarrow was Miss A. G. Waters, of the American Methodist Mission at Nanziang, who fled from her station only when very fierce fighting started right in her compound.

General Lu, heading the Chekiang army, with headquarters at Hangchow, fled to Shanghai when two divisions of his men deserted. Twenty thousand men deserting in a body would discourage almost any general, but General Lu issued a proclamation telling of his plans after he had conquered in this war, and taken over Nanking, the stronghold of the opposing General Chi. General Lu simply changed his headquarters to Shanghai, a better and more advantageous point, he contended, and in the same breath declared that whichever of his generals reached Hangchow first should claim the province of Chekiang. Moreover, when within a week five of his six ships deserted from the Chekiang navy (it is rumored the "Squeeze" was $160,000 paid by Kiangsu) Lu again declared his intention of a final victory over the Chihli party in general and Kiangsu in particular; also he suggested that he would be the cause of President Tsao Kun's becoming a fugitive.

Modern Death-Dealing Devices

GENERAL LU certainly has a stout heart if he can close his eyes to the desertion of twenty thousand men, and five battleships, and still vision a victory which, he contends, will end in a unified China.

The Chekiang-Kiangsu war, which has already cost its thousands of lives, and its tens of thousands of wounded, is but as a flea-bite compared with the warfare that will be raging in China within the next two months, according to the wise and older heads in this country.

Last summer a so-called peace treaty was made between Chekiang and Kiangsu which was worse than no treaty at all, because it failed to touch upon the most important question between the two provinces, namely, whether Shanghai should remain independent or should again become a part of Kiangsu. Unless this matter is settled once and for all, there will be no lasting peace between the two provinces or in China. The government at Pekin—called the Central Government—is also dissatisfied.

This war, unlike any other Chinese war all down the ages, is being prosecuted in an up-to-the-minute manner. Only modern death-dealing missiles are being used. Except for poison gases, all the missiles that were used in the World War are being employed here—trenches, mortars, bombs, hand grenades, airplanes, armored cars, everything.

Russians are being more and more recruited into the Chekiang army, and most of them have seen service in the great war. They are regarded as a distinct asset to a Chinese army, and are being enlisted at $8 a day, payment being made daily. Aside from this there is arranged certain insurance providing for wounds, and other insurance to be paid to dependents in case of death.

Spanish Interruptions—By V. S. PRITCHETT

"DEMONIO! Stop it!"

I look out of my window. The sky pours its molten blue upon Madrid and upon the pale, burnt plateau that varies from ledge to ledge, table-land to table-land, slope to slope, a hundred and fifty miles and more around it. In the hot haze due south are the red hills of Toledo, where the olive groves are marching, squadrons of them. There is the oasis-green of the Tagus valley. On the white roads the bells of the ox teams knell, the bells of the mule teams jingle, and the bells of the dusty sheep talk and talk like the bubbling and dropping of brook water. In Toledo the thin convent bells hit and hammer and the boom of the cathedral bell treads the air. On Toledo the sky pours its molten blue all day. In the brief twilight its silhouette, sharp and indigo, stands gravely against the white gold of the western sky.

"Demonio! Stop it!"

I come back to looking out of my window. The western walls of Madrid stare, white and red, at the sun. Madrid is glaring. It is a hard, unflinching glare. I hear the hard snarl of taxi horns. I hear the splitting cries of the news-women, the hard cries of the sellers of lottery tickets, the lugubrious cries of the men who sell crabs, the thin nasal voices of beggars singing below. And then comes the hard, sledge-hammer voice of Maria in the kitchen:

"Carlos! Demonio! Stop it!"

How can I think of beautiful things? Maria has dusted the hall and Carlos is teasing her in the kitchen. Don Carlos de Bourbon we call him, because it is absurd and makes him laugh. He is the youngest son of the family. Maria, whose tongue beats out the words like a sledge hammer and who walks like a queen, is the maid. Always when I am looking out of my window and traveling with Don Quixote through La Mancha, or with Borrow over the Leon Pass to Segovia, Maria sings a hoarse northern song, or Carlos pulls her hair, and I am brought back from castles in Spain to life in Spain.

Maria is from the north and cooks well, and breaks things, and is always scrubbing the hall when one's guests arrive. But she is energetic withal. Carlos is from the south, from Andalusia. Doña Carmen, his mother, is slight and dark and pretty, with black dull eyes. She is reserved, gentle, apathetic and affectionate. But talk to her of Cadiz and a radiance falls on her slim body, her eyes talk and have the eloquence of stars. The good days in Cadiz and Jerez, that blue week in Malaga and that white week in Seville with orange blossom odors in the air, will she ever forget them? How she climbed the Giralda! And sat by the deep emerald flow of the fountains in the Alcazar, and scarcely noticed the ceremonious wave of the palms as the courtly wind passed by! There were roses, too, millions of them, red and white and yellow, and the inspired honeysuckle.

In Seville all the senses were content in that white Easter. All one needed to do was to sit half in the shade, half in the sun, and close one's eyes, and the perfection of the hour came upon one in a gentle and cool crescendo, with the solace of a fan. The heart soared. The spirit deepened. So the eyes of Doña Carmen will tell you. Seville, like fairy porcelain, lies on the green tray of Andalusia, green no longer with the burning of the terrible sun. In Seville there is enchantment. But Juan, the brother of Carlos, a handsome boy, dark and fatally conversational, shabby and familiar, who doesn't do a stroke of work, often brings to my mind the other picture. As when I have been looking out of my window and Maria has cried, "Demonio! Stop it!" or *"Madre Mia"* or *"Maria Santissima,"* my dreams drop from me. The oil, the drains, the cafés, the alleys and the oily people sprawling and breathing their way in the dust up Sierpes—black and white and breathing blots they seem in the violent sunlight—these are things one forgets in the Alcazar when one's head is turned by the smell of orange blossom in the air. In Sierpes, heavy, fat men sit in a club, vacantly, drowsily, silently, in a condition of perspiring mental vacuum all day. Once, on the site of that club stood a prison. There, Cervantes was once an unwilling guest.

Commodore Stephen Decatur, hero of the *United States-Macedonian* duel. At twenty-five a captain, with a gold medal and a sword from Congress—at thirty, commander of the *United States*, the ship on which eleven years before he had served as midshipman.

Stories Our Old Log Books Tell

A Gallant British Officer Eats His Words

By WILLIAM J. MADDOX

ONE evening in the early summer of 1812, two officers sat over their wine in the cabin of the U. S. Frigate *United States* at anchor in Hampton Roads off Norfolk. Dinner had been cleared away, and they chatted in easy informality across the smooth-worn board. They were captains. But there the likeness stopped. One wore the uniform of the youthful American Navy, the other that of the British. Beyond this, too, there was an interesting contrast in the men themselves.

The host—the American—was scarcely above thirty. Pretty young, one would think, for the responsibilities of commanding a frigate of fifty-four guns. And there was just the merest suggestion of such a feeling in the manner of his guest. A thoughtfulness and poise about the American, though, bespoke early maturity in the school of experience. By a feat of daring at Tripoli during the war with the pirates he had earned his captain's commission at twenty-five, with a gold medal and a sword from Congress. At thirty, he commanded one of the pride frigates of the American Navy, the ship on which, eleven years before, he had served as a midshipman.

Such was Stephen Decatur, the younger, commanding the U. S. Frigate *United States*.

His guest, Captain Sir John Carden, commanding His Majesty's Frigate *Macedonian,* which rode peacefully at anchor not a cable's length away, was a man of different stamp. He was much older, with all the cocksureness of the British officer, conscious of his training in a navy to which the sea is a tradition. He was a born disciplinarian. Severity had lined his face and tightened his mouth. Throughout the British Navy he was known as a martinet—an able officer and a brave man.

Peace existed between the two countries just then, but war was in the air. English men-of-war were overhauling American ships on the high seas, on the pretext of taking deserters, and impressing American sailors. The conversation of the two officers turned on the prospect of the United States taking the last recourse to protect the rights of its seamen. They were good friends, but Sir John could not entirely forget, even as a guest, his uniform and years. At last he broke forth tartly:

"Look you here, Decatur, can Yankee seamen think to meet the ships of the Royal Navy on the high seas with hostile intent and not go down to defeat at the first test of battle? Vain thought! 'Tis simply absurd! Though your ships may be good enough and you are a clever set of fellows, what practice have you had in war? There's the rub!"

Decatur might well have asked where the rub was when Paul Jones swept the English Channel and sent English ships scurrying to cover—and were glad enough to have a place to hide. Whatever his reply, though, is not important. The irony of the thing has kept Carden's vanity alive. Within a few months, he and Decatur were to meet in one of the most notable sea duels of naval history. And Carden was to lose his ship in the first encounter.

Not only that, but in the eighteen encounters of the war, the Royal Navy was destined to meet with fifteen defeats.

One day in London, William Cobbett, the English radical, was praising the American victories. A British naval officer took exception to his remarks.

"There was good reason for it," rapped out the officer hotly. "I went aboard their men-of-war after our defeats, and found half their sailors were English."

"And," retorted Cobbett, "had you not *all* English?"

Carden and Decatur parted at Norfolk with the esteem and good wishes of one gallant officer for another.

War clouds were gathering thick. Americans even had but little confidence in their sea forces. The very name of the British Navy, weighted with traditions, seemed irresistible. President Madison and a coterie of weak-kneed advisors were for keeping the navy out of harm's way by mooring it up in safe harbors. Yankee ships and Yankee seamen were not thought capable of defending their right to go and come on the seas. And it's likely they would have had their way had not two distinguished officers, Commodores Stewart and Bainbridge, pleaded earnestly against it. In the end they carried the day.

On the eighteenth of June war was declared, and our second fight for independence—this time on the seas—was begun. Decatur with the *United States* was on a short cruise. As soon as he heard the news he hastened back to New York and joined the squadron being formed under Commodore John Rodgers. They were all ready to sail, and on the morning of the twenty-first, with the unlucky *President* as flagship, Rodgers weighed anchor. Clearing Sandy Hook in the afternoon, the squadron ran off to the southeast.

Rodgers' mission was to intercept a fleet of English West Indiamen returning to England. Two days out, a British frigate, the *Belvidera,* thirty-six guns, commanded by Captain Richard Byron, hove in sight. The *President* gave chase. But the best she could do was to engage the Britisher in a running fight from which she emerged much worse for the encounter. When things became too warm for her, the *Belvidera* showed a clean pair of heels. The pursuit of the West Indiamen carried the squadron as far as the chops of the English Channel, where Rodgers turned back having failed in his object. On August 31, the *United States* returned to Boston.

The second cruise of the *United States* in Rodgers' squadron was a short one. On October 8 they left Boston. Four days out Decatur decided to shift for himself. Taking advantage of a favorable opportunity he slipped away from the fleet and stood to the southward and eastward, with a view to getting into the track of the enemy's Indiamen.

Decatur's bold stroke was hailed by his men with delight. They had had enough of the Commodore. They wanted action and prize money. They were spoiling for a fight. The war had been on four months and they had hardly struck a lick. So their hearts gave a bound when they saw that Decatur was daringly trimming his course toward the heart of the British trade routes. Here, if anywhere, prizes were to be had and telling blows delivered at the enemy.

And they had not long to wait.

Unlike the *President,* the *United States* was known as a lucky ship from the start. She had been the first of the new frigates built under the Authorization of 1796, at a cost of $299,336. No less a person than Commodore John Barry, senior officer of the navy, had supervised her construction. And when she slipped into the water at Philadelphia, July 10, 1797, she was considered the last word in shipbuilding. She was 175 feet in length, with 43.6 beam, and mounted thirty-two 24-pounders and twenty-two 42-pound carronades.

When first fitted for sea, however, the new frigate revealed decidedly poor sailing qualities. She was dubbed the "Old Wagon," and the name stuck. It was soon discovered, though, that she could hold her own with most of the ships of her class when trimmed by the head.

But she had the name of being a lucky ship—and that was what counted with the men. It meant action and prize money.

The weather kept fine. Occasional calms were encountered, but for the most part there was a good wind and easy sailing.

The afternoon of Saturday, the twenty-fourth, found the *United States* about eight hundred miles due west of the Canaries. The weather was pleasant and moderate. The light sails and storm staysails had been stowed away. At 2 p. m. what little breeze there was began dying down, and the mainsail and spanker were hauled up. At midnight a calm fell which continued until 4 a. m.

The *United States* was now in the track of the enemy's merchantmen and every man was on his toes.

Sunday morning broke clear with a light wind from the south and east. At 6 o'clock the lookout descried a strange sail from the masthead to the south and east. Decatur ordered the ship cleared for action. At 8 o'clock it was seen that she was a frigate with British colors.

The *United States* was in latitude 29° north, longitude 29° 30′ west.

Both ships were eager for the fight. The Britisher, who had been running a little free, now bore down under a full press of canvas with topmast and topgallant studding sails set. The *United States* was close hauled on the port tack, the wind being fresh from the SSE. It was a gallant sight for a peaceful Sunday morning, the ships standing toward one another gracefully spreading their dimity like belles in a minuet.

With a grim sort of joy, Decatur made out the stranger to be the *Macedonian.* She was a frigate of the largest class, two years old, four months out of dock, and reputed to be one of the best sailers in the British Navy. She mounted 49 guns, the odd one shifting, and carried a complement of 301 men.

The *Macedonian* was slightly lighter than the *United States.* But Carden prided himself on the efficiency of his ship. And being to the windward, he had the advantage of engaging at his own distance. This was considered a position of great importance, and Carden was determined to keep it. For when he had come to within a league he hauled by the wind and came round on the same tack as the *United States.* Decatur was keeping close to the wind, so close that the leeches of his sails shook. The distance between the ships was gradually diminishing. When he had closed to little more than a mile, Carden hauled up on an easy bowline and opened the action. Decatur replied with a larboard broadside that fell short. The distance was too great for the carronades.

Wearing round, the *United States* now came up to the wind on the other tack, heading northerly. This brought her starboard battery into play, and Decatur delivered another broadside. This time his long 24's reached home. The fire from the *Macedonian* was doing but little damage.

"Aim for the yellow!" was the word passed round to the gunners by Lieutenant Allen, the man to whose training their telling marksmanship was largely due. The yellow was a stripe that marked the Britisher's hull at about the water line.

Coming round again, the *United States* headed once more to the southward, on the same tack as the *Macedonian,* both ships keeping up a heavy cannonade.

Seeing that his fire was ineffectual, and having the advantage of the wind, Carden attempted to close. But he had put off too long a move that should have been taken early in the action. Dropping his foresail, he bore up and came down on the *United States,* keeping the wind on his port quarter.

Decatur, meanwhile, laid his main-topsail to the mast and poured in a terrific fire on the approaching ship. Hauling up, Carden replied with his starboard battery. But Decatur gave him two for one. It was his first advantage of the action and he pressed it home with a will. So fierce was the American fire and so

(Concluded on page 15)

The *United States* raking the *Macedonian* in the last stages of the fight. Decatur crossed her wake handsomely and withdrew to reeve new rigging. When he returned to renew the action, Carden struck his colors.

Ringing at the Door of Yesterday

The Romantic Fascination of Lambeth Palace

By W. TEIGNMOUTH SHORE

Drawings by L. Pern Bird

I FELT as if I were ringing at the door of yesterday when standing before the Great Gatehouse of Lambeth Palace: a mellow, red-brick building with gray, stone dressings; set up or rebuilt more than four hundred years ago by John Morton, Cardinal, Archbishop of Canterbury, Lord Chancellor to King Henry VII and as famous a builder as his master.

Behind me the River Thames glinting in casual sunshine; beyond it Westminster and the City; close on my right hand the parish church of Lambeth, in which many an archbishop lies sleeping, let us hope the sleep of the just, and against the sturdy tower whereof Mary Beatrice of Modena, Queen to King James II, flying from the Royal Palace of Whitehall across the water, with her infant son in her arms cowered for shelter one bleak winter night in 1688, the while they brought a common coach to carry her to Greenwich, on her way to helpless exile.

Despite the clanking of the trolley cars, the uproar of automobiles and heavy wagons, and now and again a snort from a river steamer, it seemed as if I were saying farewell to today as I passed through the gate into the spacious courtyard and that I was stepping into yesterday; countless yesterdays.

As with many another ancient building in London, Lambeth Palace is a case of new spirits in an old bottle; the vivid life of then mingling freely with the no less vivid life of now. Looking round the quiet, stately courtyard my thoughts ranged backward and forward, to the business of the past and of the present.

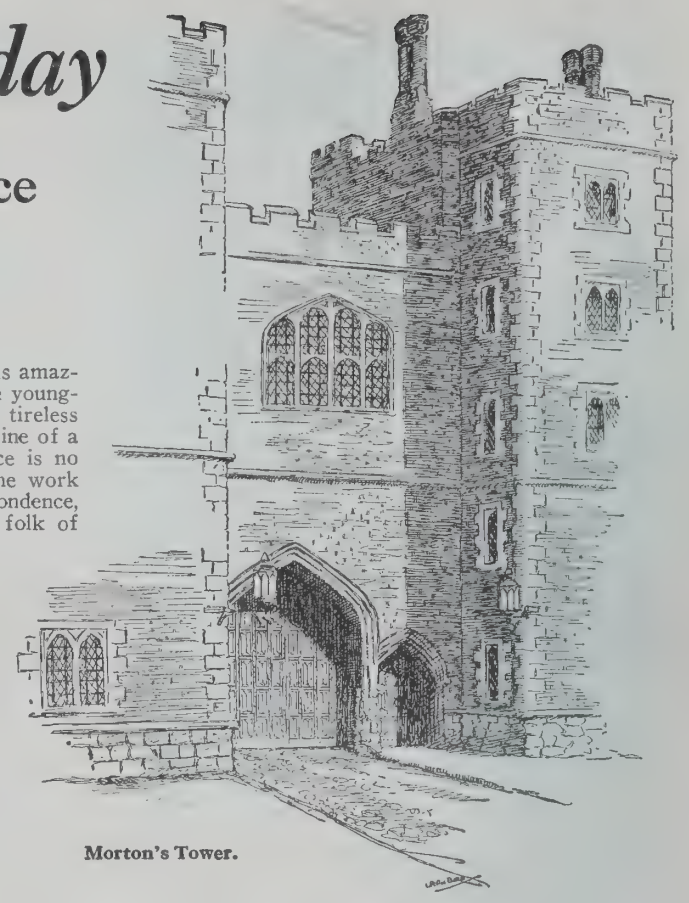
Today, here lives and works a most eagerly busy Englishman: the Most Reverend and Right Honorable Randall Thomas Davidson, Lord Archbishop of Canterbury, Primate of All England and Metropolitan; born in April of the year 1848; Bishop of Rochester, 1891-1895; of Winchester, 1895-1903, in which year he was appointed to the See and Archbishopric of Canterbury. In earlier years he had been Dean of Windsor and a favored counselor and personal friend of Queen Victoria. It is interesting to note that among those who assisted at his consecration as Bishop of Rochester, in Westminster Abbey, was Benjamin Whipple, Bishop of Minnesota. There is a close bond between the Church of England and the Protestant Episcopal Church of America.

At His Grace's kindly invitation I had come here to learn somewhat of the strenuous life the Primate leads and of the multifarious calls that are made upon his time and energies.

He succeeded to a great tradition; has followed in the footsteps of many men of high place in the history of England. The names of some of his predecessors spring readily to memory. Long before Lambeth Palace was built was the first Archbishop of Canterbury, Saint Augustine, the earliest of the missionaries sent from Rome to this country; Saint Dunstan, a man of many ventures and adventures, who is said to have put the Devil's nose out of joint by tweaking it severely; Saint Thomas à Becket, 1162-1170, whose shrine was an attraction to so many Canterbury Pilgrims; the aforementioned Cardinal Morton, 1486-1500; Thomas Cranmer, 1533-1556; burned at the stake for persisting in holding pestilent Protestant heresies; William Laud, 1633-1645, faithful servant to faithless King Charles, and so on.

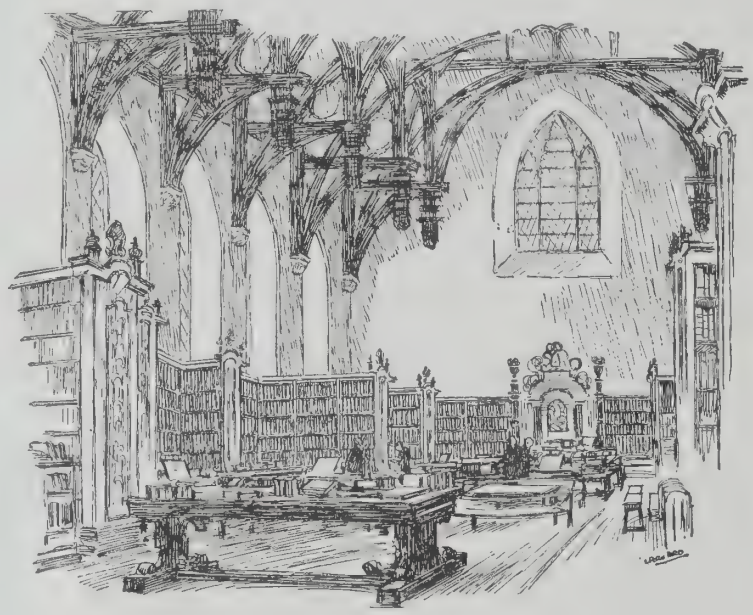
I rang at an inner door, and, passing through the lofty entrance hall, was greeted at the top of the broad stairway by His Grace's chaplain. Crossing the threshold I had immediately sensed that I was in an abode fitting for the first Peer of the Realm, who takes precedence of all officers of state and of all dukes save those of the royal blood; supreme head of the Anglican church, second to the King of England only.

Assisted by his secretaries in his private room, "My sanctum," as he terms it, the Archbishop daily spends many strenuous hours. Despite his 76 years he is amazingly vigorous in mind and body, astonishing the youngest of his visitors and fellow-workers by his tireless energy and facile mentality. The following outline of a typical day's work serves to show that his office is no sinecure: Prayers, 8:30, then breakfast; routine work and dealing personally with his immense correspondence, 9:45 to 11:00; interviewing some of the many folk of all degrees and almost all nations who come to him for advice and help, 11:00 to 12:00; then, say, a visit to the British Museum, of which he is one of the principal trustees and in the working of which he takes a great and lively interest; luncheon at 1:30; more routine work, 2:00 to 3:45; then, when it is sitting, a walk along the Embankment and over Westminster Bridge to the House of Lords, 4:00 to 6:00 or 6:30; back to the palace for more routine work, the signing of letters and so forth, till 7:30; dinner at 8:00; prayers at 9:45; clearing up odds and ends of work till, say, 11:00; bed about 12:00. A well-filled and laborious day!



Morton's Tower.

Imperative calls upon his time are almost endless. Nominally the King is governor of the Church of England; the Archbishop may be described as its permanent prime minister. He plays a big part in national life, by no means confining himself to things ecclesiastical. He is constant in his attendance at the House of Lords; being in a sense looked on as the Father of the House, advising with and being consulted by his fellow peers of all parties not only upon all political matters which in any degree trench upon this kindly, fatherly interest "does not tend even remotely in the direction of what could be called an autocracy. The risk of any outcome so disastrous as that would be, grows less, not greater. But in scores of cases in which there is no actual jurisdiction to be exercised this filial relationship results in the encouragement of mutual loyalty between part and part, and in the maintenance of truest communion and fellowship throughout the scattered branches of what is now a world-wide church." He is officially consulted by the bishops of the Church of England upon knotty points of church discipline and doctrine, and often upon legal problems of many kinds. They all, including the Archbishop of York, act in co-ordination with the Primate in the conduct of church affairs.



The Great Hall, or library.

There are two important Anglican Communions in North America: in Canada and in the United States. In 1787, Dr. Charles Inglis was consecrated Bishop of Nova Scotia with jurisdiction over all British possessions in North America.

Many of the bishops of the Protestant Episcopal Church of the United States are among the personal friends of the Primate; all are in close fellowship with him, trusting in him, looking on him as a wise advisor and as one always ready to help with counsel and sympathy. Numerous are the visitors from the United States and none more warmly welcome. It is worthy of note that Doctor Randall Davidson was the first Archbishop of Canterbury to cross the Atlantic, in 1904 visiting America, speaking and preaching in Washington, Philadelphia, New York City, Boston and elsewhere.

Such is the man. Such is his work.

Yet the whole atmosphere of Lambeth Palace is one of peace, not of stress and strain. Difficult it is to believe that anyone is ardently busy in these tranquil rooms with their air of quiet dignity. I hear no call to be energetic as I look out of the broad windows of the drawing-room on trim lawns and stately trees. But I turn to look at the fine portrait of the Primate painted by Sargent, and remember the busy brain at work in the "sanctum" nearby. These rooms are in the modern portion of the palace, built by Archbishop Howley in the years 1829-1834; not a high-water period in English architecture; all that can be truly said of this prelate's handiwork is that it is "not so bad as it might have been."

The best-known portion of the old palace is the Lollards' Tower, dating from the middle of the fifteenth century; so called by reason of the popular belief, for which there is no sound foundation, that here were imprisoned many Lollards, followers of Wycliffe. But certainly in this grim place, in the year 1648, Colonel Richard Lovelace, Cavalier soldier and poet, was a prisoner. It is pleasing to know that he was described as "the most amiable and beautiful person that ever eye beheld." It was not here, however, but in the Gatehouse prison at Westminster that he wrote:

Stone walls do not a prison make,
Nor iron bars a cage.

And I like to think that in olden days, when the river was the busiest highway in London, the watermen doffed their caps as they rowed by to the image of Saint Thomas à Becket that stood in a niche on this tower.

Many a long and profitable hour could I have spent rambling hither and thither here, but had not the hard-heartedness to trespass too heavily upon the good-nature of my kindly entertainer. I looked into the dining room, known in the past as the Guard Chamber; a fine apartment, of which the most humanly interesting feature is the magnificent series of portraits of the Archbishops since the year 1503; most admirable perhaps is that of Archbishop Warham painted by Hans Holbein, which hangs over the ample fireplace; but almost equally noteworthy are those of Laud by Vandyke and of Thomas Secker by Reynolds.

Then into the Great Hall, a noble chamber, built, or, rather, rebuilt by Archbishop William Juxon, who, it

The Archbishop in his private room. (Drawn by special permission of His Grace.)

the interests of the church but also upon questions affecting public morals. By the way: William Wake, 1657-1737, was the last archbishop to go to Parliament in his stately barge: "a boat of noble shape, and ornamented with the ensign of the archbishop's dignity, always on the river, in which he can at any moment cross to Whitehall."

The Anglican Communion comprises all the churches in communion with the Church of England; namely, the Church of England itself, the Scottish Episcopal Church; the Protestant Episcopal Church of the United States of America; also the various provinces throughout the British Empire and certain missionary jurisdictions attached to the See of Canterbury. The Archbishop is the foremost personage in the National Assembly of the Church of England, which was constituted "to deliberate on all matters concerning the Church of England, and to make provision in respect thereof," and which consists of three houses—Bishops, Clergy and Laity. He is the chairman of the Upper House of the Convocation of Canterbury. Seemingly, this would be enough work for any one man, but to this has to be added all the regular work of the diocese! He also presides over the Lambeth Conferences, held since 1878 every ten years and attended by all the bishops of the Church of England and of the churches in communion with it. He holds almost numberless offices, which entail work to which he gives patient and painstaking attention. His authority, official and unofficial, moral and material, is boundless. But never has any man presumed less upon the power of his place, or made smaller demand to have "the say so" except when strictly called upon to do so by the exigencies of his office. He is *not* an Anglican pope! But he is trusted, consulted, esteemed by high and low in Anglican communities throughout the world. As he himself has pointed out,

will be remembered, attended Charles I upon the scaffold at Whitehall and received his last words. Of the many places in London town that are haunted for me by those who have lived in the pages of fiction only this is one. Do we not read in the "Memoirs of the Life of Mr. John Inglesant, Sometime Servant to King Charles I," set forth by John Henry Shorthouse, that one day in September of the year 1640 Inglesant went by water to Lambeth, having been invited to dinner by Archbishop Laud? After the repast, which was served in this Great Hall and during which many anxious matters were discussed, "the Archbishop rose from table, and retired into one of the windows, at the upper end of the hall, overlooking the river, requesting Inglesant, to whom he pointed out the beauties of the view, to follow him." Today, we too can stand there, looking upon the beauties of the view, though all things there have been vastly changed since those days when Lambeth was an outlying village.

This hall now houses the library, which was founded with a bequest of books from Archbishop Bancroft, who died in the year 1610, being a contemporary therefore of two quite well-known folk—Queen Bess and her servant William Shakespeare, both of whom may have been here; the former certainly was on more than one occasion, an exacting, expensive, and sometimes exasperating guest to entertain! Among the valuable books here gathered together is preserved her prayerbook, looking almost as freshly bright as a thing of yesteryear.

"In Lambeth Palace chapel no instructed man can look round him without the inrush of thoughts, associations, and memories, rich and plentiful, modern as well as old," says Doctor Randall Davidson; true saying, indeed. It dates from about the year 1250; its builder Boniface of Savoy, Archbishop, who died in the year 1270, while accompanying Edward I upon a Crusade. Bald, bare facts, but they resound of the medieval and rouse strange, murmuring echoes in this little house of worship. Herein since that date many archbishops have been consecrated; in 1750 the first Anglican American Bishop, Charles Inglis, already mentioned; herein for more than seven hundred years—with a brief intermission during the Commonwealth—daily service has been said or sung morning and evening. Herein ribald men danced and sang in the Puritan days, as is more or less credibly stated; if truly so, the less Puritan they! Puritanism had been made by its enemies to cover a multitude of sins never committed.

But the Palace and this chapel in particular were evilly entreated in those days; after the Restoration Juxon found it in poor condition; very much of a ruin. There has been too much indiscreet restoration since in these ancient buildings. But there still lingers here the spirit of the past. It is still haunted by memories of the great dead.

Archbishop Potter (1715-1737) was the first to call this manor house a palace. Officially, in documents, it is still designated "our house" at Lambeth. Strictly speaking, a bishop's palace is situated in the city from which the see takes its name; the house being his mansion elsewhere, as this of the Archbishop at Lambeth. His palace is at Canterbury, where he yearly spends four of his busiest months, October to January.

The Old Guard Room (with the famous Holbein portrait of Archbishop Warham over the fireplace).

But whether it be palace or house, what matters it? Herein have dwelt many leading players in the tragedies and the comedies of English history for centuries past. It is the abode of the dead and of the living; a part of yesterday and of today.

"The Almighty Dollar"—A Brief History

Concluded from page 5

lars, naturally American silver dollars were sent, as the Spanish coins commanded a premium at the mint. To meet this difficulty Jefferson suspended the coinage of the silver dollar and from 1805 to 1839 no American silver dollar was struck. However, as the smaller silver coins had relatively the same quantity of silver, gradually these also were exported and foreign coins constituted a large portion of American currency. From 1826 to 1830 out of eleven million of silver money coined in America, eight million were coined from foreign dollars.

In 1834 a heroic measure was passed by Congress in the Coinage Act of 1834 fixing the ratio of silver to gold at 16 to 1. This over-valued the gold just as the 15 to 1 over-valued the silver. As the actual ratio was 15.7 to 1, one could buy for $157 in silver bullion an amount of gold which would give $160 in American gold coin. The gain on such a transaction was approximately 2 per cent, which was more than sufficient to make the exchange highly profitable. During the period from 1834 to 1873 the silver disappeared just as the gold had done in the preceding years. During this time gold and, during the Civil War, "greenbacks" were the medium of exchange and silver was obtained with difficulty. Simon Newcomb, the astronomer, wrote in 1879 that "it would probably be safe to assert that .... one-half of the citizens of our country, born since 1840, had never seen a United States silver dollar."

It must be remembered that both silver and gold have intrinsic value for many commercial purposes even aside from the very evident gold and silver smiles which we all see every day. Gold and silver are commodities like potatoes and the possessor of either metal naturally seeks to sell it where it purchases the most. An actual debasement of American currency was introduced by the act of 1834 in that the gold eagle was reduced from 247.5 grains to 232 grains, a reduction of more than 6 per cent.

In 1853 Congress recognized the urgent need of fractional silver currency, that is, half-dollars, quarters, dimes, and half-dimes, by an act decreasing the amount of silver in these coins below the point where it was profitable to sell them as bullion. Silver like copper was treated in this act as a subsidiary metal, used for convenience and not as the standard of value. The amount of silver in the fractional coins was reduced to 345.6 grains to the dollar and free coinage of silver was abandoned.

The paper money of the Civil War drove out both gold and silver just as first (1792-1834) the cheaper silver had driven out the gold and then as the cheaper gold (1834-1853) had driven out the silver. This is according to what is known as Gresham's law, that when there are two types of currency the cheaper will drive the other out of circulation.

In 1873 the silver dollar was dropped and by the act of 1873 the fractional silver coins became "legal tender at their nominal value for any amount not exceeding five dollars in any one payment." In 1874 this act was extended to include all silver coins. This, and the act of 1873 in suspending the coinage of dollars, constituted the demonetization of silver. From 1874 to 1877 no silver dollars were struck but in 1878 their coinage, but not free coinage, was resumed with the weight 412.5 grains and .900 fine.

The price of silver began to fall quite rapidly in 1874 and continued to do so for about thirty years with particularly violent fluctuations during the last ten years. The first cause of the decrease in silver was doubtless the increased production due to the discovery of the Nevada silver mines. Before 1860 more ounces of gold were mined in America than silver, but the amount of silver produced here was more than double the gold from 1861 to 1865, four times as much from 1866 to 1870, eight times as much in 1871, thirteen times as much in 1872, and sixteen times as much from 1873 to 1875. Further than this, during this period, Germany, in 1871, and other countries about that time, went on a gold basis as gold was found so much more suitable to the larger commercial transactions. The financial supremacy of England with its gold standard had no little to do with the general adoption of gold. The metal itself has, it cannot be denied, a strange fascination for Europeans and Americans, more so than it has for Orientals.

At the present time the bullion value of the silver in a silver dollar is less than 50 cents gold, and during the past twenty years has been as low (1909) as 40 cents and as high as 86.7 cents (1919).

The dollar sign which we commonly think of as some form of U. S. with the letters intertwined has nothing to do with these letters. Professor Florian Cajori, of the University of California, after extensive study of documents used in Colonial times, has shown that the $ sign is an abbreviation first used for the Spanish dollar or peso, a combination of the letters *p* and *s*. Since the dollar itself was adopted in America largely because of the wide use of the Spanish dollar it is highly appropriate that the symbol should happen to be Spanish in origin.

During the period 1794 to 1804, inclusive, about one and one-half million dollars were coined, the first one being struck in 1794. From 1805 to 1837 none were coined; from 1837 to 1873, six and one-half million appeared. During the years 1873 to 1878 nearly thirty-five million of so-called trade dollars of 420 grains were struck for commercial use in dealing with India and the Orient to compete with the Mexican dollars. A large portion of our American dollars continue to be used for this purpose. Aside from trade dollars slightly more than eight hundred million of the so-called "iron men" have been coined by the United States. A grand total of one billion three hundred sixteen million dollars and then some not worth mentioning has left the American mints in the form of silver coins while three billion five hundred forty million and then some odd thousands in gold coin have been thrust upon the American public by a supposedly generous government.

By far the larger portion of gold coin and bullion, more than four billion in the two forms, is held by the United States Treasury and the Federal Reserve System. Some four hundred million of gold is technically in circulation, although much of this is in small banks as reserve. Some fifty million of silver dollars and two hundred fifty of subsidiary silver is in circulation but Uncle Sam has at the present time about 450 further million in vaults largely represented in circulation by the silver certificates. According to a recent Federal Reserve Bulletin the per capita gold in circulation is $3.52, gold certificates $7.11 (a lucky combination), silver $2.73, and silver certificates $3.23, with a grand total of all forms of U. S. notes and conveyances Federal Reserve notes of $42.20 a head. Of this $42.20 nearly $17 per capita is in the form of Federal Reserve notes, which have certainly helped to swell our currency.

At the present time we certainly do have, by the influx of gold and other means, the cheap money which was the goal ardently sought by the advocates of sixteen to one. However, all the signs of the times point to a dollar with more purchasing power. Keep this in mind and remember that the only mighty dollar is the one which is to your credit.

Mexico's Children—Submerged

Concluded from page 3

civilizing death rate among their adult population, we shall have to come to their assistance.

Why should we not? We are the world's richest nation, we are perhaps the world's best organizers, we are among its most humanitarian peoples. We have sprung to the relief of China and Japan, of France and Poland, of Austria, of Russia, of the Near East. Everywhere our initiative, our energy, our faculty for getting at the causes of things, have not only relieved the calamity of the moment but have brought about basic changes in the environment that in some cases have made possible an almost magical rise in the level of life and well-being. The stamping out of hookworm in infected areas has changed the face of the world for whole populations, the diverting of a river bed has banished the specter of famine from a province where for centuries it has stalked. As the people of these infected areas, these starved provinces, recovered from the enervation, the depression, the paralysis of their basic evils, they have more and more developed the intelligence, the ambition and the will power to tackle their other problems for themselves.

And so, beyond question, would the Mexicans. Their basic evil, the evil from which all their other evils spring, is the devastating death rate—with all the widespread sickness such a death rate indicates—among those age groups of the population who should be the very bulwark of the national well-being. Until that is checked there is little we can hope for either from the present generation or the one that is to succeed it. If children are to be brought up in anything like the standards of the civilized world, there must be grown people enough to do it. There must be enough not only to feed and clothe them, to shelter them, to cook and wash and sew for them, but there must be whole armies of men and women engaged in services less immediate but none the less vital for that. There must be roads and railroads to break up that isolation in which nothing but savagery or barbarism can exist. There must be schools, there must be libraries and playgrounds, there must be abundant and pure water, there must be food inspection, public sanitation, medical and nursing services within the reach of all. There must, therefore, be men and women to build and organize these things and run them after they are organized and built. And back of them there must be men and women enough to meet the cost of these tremendously expensive undertakings.

Mexico's tragedy is that just as her citizens reach the age for this they die. But are we willing that they should keep on doing so? Are we willing that this generation of her children, bright children, lovable children, children whose potentialities impress every foreigner who has to deal with them, should grow up in the poverty, the ignorance, the violence that has made their nation so antipathetic to us, so difficult in all the contacts we have had with it? Wouldn't we rather that they had their chance at the standards, the ideals, the relationships of the modern world?

If so, we can see that they get it. And we are probably the only people that can.

The Lord's Acre

By J. C. GILBERT

> Sow to yourselves in righteousness, reap in mercy; break up your fallow ground: for it is time to seek the Lord, till He come and rain righteousness upon you.—*Hos. 10-12.*

MEMBERS of the Methodist Church of Plainville, Kansas, tiring of the usual methods of raising money for their church, put in 160 acres of wheat last autumn. The wheat on this quarter section turned out 3,261 bushels of the finest grain of which the church realized a two-thirds share. After all expenses had been paid the church realized a net balance of $1,383.97 which was later augmented by a donation of $22.22 made by the man who hauled the wheat, swelling the total net revenue to $1,406.19.

The labor was given free by the people who had the interest of the church at heart and the result is seen not only in the money raised but in the new solidarity of the membership which this activity has caused. The good feeling that existed from the day the field was planted until the grain was harvested and sold was evidenced by the fact that there were those that did not belong to the Methodist church or any other church who willingly put their shoulders to the wheel and helped the cause. It is indeed a remarkable achievement and one worthy of repetition. Apart from being a creditable financial undertaking in itself it is a welcome departure from the usual bazaars, ice cream socials and other revenue-raising events on which the churches so often have to depend for their very existence.

Another instance comes to our notice. Last year, the Rev. H. M. Melton, pastor of the Baptist Church of Bluffton, Georgia, induced seven planters to sign the following agreement:

"We, the undersigned farmer members of the Bluffton Baptist Church, hereby agree to plant, cultivate and harvest one acre from our farm, said acre to be known as the Lord's acre. We agree to turn the proceeds of said acre in to a committee appointed by the church. They are to dispose of same and distribute the funds derived from it in such a way as we may instruct."

The boll weevil did its worst that year but it touched not the Lord's acres. One planter grew a bale of cotton on his Lord's acre, which he did not even spray with calcium arsenate. "It is in the Lord's hands," said he. As a result of this little experiment, this year Baptist headquarters in Atlanta were amazed to find that 100 churches in Georgia had instituted the Lord's acre idea, making a total of 500 acres, from which the yield is expected to be at least $20.000. Surely these are commendable undertakings and serve to stabilize church finances.

Breaking—the Means of Making

Concluded from page 4

by the Chase National Bank of New York. Spot cash in *gold* upon delivery was paid.

In this enormous cotton movement to Germany and Russia, governments are wondering what proportion is to be used for war purposes. Germany has more stored, unmanufactured cotton today than she had in 1913.

> The Federal International Banking Company of New Orleans, of which Mr. Hecht became the executive director, is the only Edge bank now in existence. The law is practically a dead letter notwithstanding the fact that upon its passage it was believed by everybody except the Jewish nationalists that it would solve the problem of financing America's export trade.

Pine Street Whispers "Wall Street"—Hist!

THE organization meeting of Mr. McHugh's projected Foreign Trade Financing Corporation was held in Chicago, December 11, 1920. The meeting was called by the ex-president of the American Bankers Association, Mr. Hawes. There was great enthusiasm. There were discussions and rediscussions. Mr. McHugh himself was made the chairman of a committee of thirty to supervise the formation of the corporation. There were some interesting names on that list: note them, they appear later.

> Mr. Paul M. Warburg, former governor of the Federal Reserve Board; chairman (at the present time) of the Advisory Committee of the Federal Reserve Board; afterward organizer and chairman of the Board of Directors of the International Acceptance Bank of No. 31 Pine Street, New York City.
>
> F. O. Watts, president of the First National Bank of St. Louis.
>
> Levi L. Rue, president of the First National Bank of Philadelphia.
>
> Philip Stockton, vice-president of the Old Colony Trust Company of Boston.

Mr. Warburg was a financier at the moment out of a job, having left the partnership in the firm of Kuhn, Loeb & Co., and he was made a member of the executive committee of the Committee on Organization of Mr. McHugh's Financing Corporation. Rudolph Hecht was called in to help organize the southern bankers. William F. Collins, now of the Seaboard National Bank of New York City, was made executive secretary of the organization committee. Offices were opened on the seventeenth floor of No. 66 Broadway. Everything was going along in a swirl.

In January, 1921, Mr. McHugh was warned that the organization program was slowing down. It was pointed out to him where the opposition lay and the reasons for the opposition. He refused to believe that there was any opposition.

During the month, however, a number of things happened; in fact the first real gun of the opposition was fired. Jewish nationalism, as a rule, has no difficulty in handling labor.

It whispers around the word "Wall Street," and labor reacts in the way that labor has been educated to react.

Whispers concerning *"Pine Street"* never start.

Something had to be done to shelve the farmer.

In a farm publication of January 24, 1921, there appeared an article signed by one William Wallace Brauer, in which the Foreign Trade Financing Corporation was called a typical Wall Street project designed to squeeze money out of the farmers. That was sufficient.

The announcement of the organization of the International Acceptance Bank of No. 31 Pine Street, New York City, appeared February 13, 1921, and the announcement was made by Mr. Warburg himself. It was organized under New York State laws, capitalized for ten million dollars.

Enter International Acceptance Bank

ON THE following day, the now defunct New York *Call,* owned and controlled by Morris Hilkowitz, gave three-quarters of a column to a laudatory story of its inception. It added that Max Warburg, of Hamburg, was organizing a similar bank in Germany. In the columns of the *Call,* anything touching on or appertaining to Wall Street leads to invective and abuse. Touching on or appertaining to Pine Street, it receives dignified presentation.

In his opening announcement, Mr. Warburg was careful to say that his bank would in no way interfere with the operations of the Foreign Trade Financing Corporation. The former, he claimed, was designed to handle short-time paper only, the latter would deal only in long-time credits.

That Mr. McHugh and his associates had not yet realized that their venture was doomed to obscurity is indicated by the fact that the *Literary Digest* carried a laudatory article of two and a half pages, March 5, 1921, on the subject of the organization of the Foreign Trade Financing Corporation. This was afterward used by the McHugh forces as advertising, the patriotic *motive* being strong.

The International Acceptance Bank, Inc., of No. 31 Pine Street, New York, was opened for business April 12, 1921. Mr. Paul M. Warburg had another job, and it was not in the Foreign Trade Financing Corporation. The organization headquarters of the latter became frequented less and less; and, finally, in June, Mr. McHugh read its obituary notice. It was said that the official opening of the Foreign Trade Financing Corporation had been placed in the hands of a committee of the Advisory Council of the Federal Reserve Board. The names of this committee were given as follows:

> Levi L. Rue, president, Philadelphia National Bank.
>
> Paul M. Warburg, formerly governor, Federal Reserve Board.
>
> John J. Mitchell, chairman, Illinois Trust and Savings Company.
>
> Philip Stockton, president, Old Colony Trust Company, Boston.
>
> E. F. Swinney, president, First National Bank, Kansas City.
>
> F. O. Watts, president, First National Bank, St. Louis.

Mr. McHugh's statement concludes as follows:

> "In view of the world conditions in trade, and in view further of the suggestion that has been made that credits should not be extended until the machinery of the League of Nations is perfected, it was deemed wisest by the organizers of the Foreign Trade Financing Corporation that a committee on policy, such as that named, should at once be appointed."

The International Acceptance Bank, Inc., of No. 31 Pine Street, New York, is doing a thriving business under the laws of the State of New York. The Foreign Trade Financing Corporation is dead.

If Mr. Warburg's bank was to do all the acceptance business out of Germany under conditions which approach normalcy, *it was quite necessary that there should be some more legislation by Congress.* In the first place, his bank was not big enough to do all that would be required of it. His position and connections with other banks were such that a large percentage of those acceptances offered from Germany could be rediscounted, but bankers generally did not like that kind of paper. It "froze" up assets even if it did pay good returns. It is quite necessary sometimes to have money where one can put hands on it quickly, even in the banking business.

Mr. Warburg as Propagandist

IN THE second place, international acceptances had not been very popular with bankers, especially outside of the big cities. As bills of exchange they were comparatively new instruments. The form had not been standardized, and even yet it sometimes takes a Philadelphia lawyer to decide as to their legality. Bankers scrutinize them with doubtful eyes before deciding to invest. In the case of paper "accepted" by a foreign bank, and failure to pay by the buyer of the goods, collections were often difficult.

But the one final reason for the legislation desired lay in another direction. The Federal Reserve System largely emanated from the brain of Mr. Warburg and was copied after the central banking system of Germany. A situation was arising which defeated its excuse for existence. That lay in the amount of its non-money-making assets. These assets were rising by leaps and bounds. The system had more money than it knew what to do with. The funds were dead and not earning, and the prospect was that, with the increase of prosperity, the difficulty of over-prosperity was not only to continue but to increase.

The solution to these many difficulties naturally lay in legislation which authorized rediscounting of this kind of paper by the Federal Reserve Bank. This latter would then be the buffer. It took two years of quiet educational propaganda in Washington to bring it about, and Mr. Warburg, of course, was the chief propagandist —but eventually it came.

The so-called *Federal Agricultural Credits Act* of 1923, which was approved in March of that year, had a rider which amended the Federal Reserve Act and it read like this:

> "Upon the indorsement of any of its member banks, which shall be deemed a waiver of demand, notice and protest by such bank as to its own indorsement exclusively, any Federal Reserve Bank may discount notes, drafts, and bills of exchange arising out of actual commercial transactions; that is, notes, drafts, and bills of exchange issued or drawn for agricultural, industrial, or commercial purposes, or the proceeds of which have been used, or are to be used, for such purposes, *the Federal Reserve Board to have the right to determine or define the character of the paper thus eligible for discount, within the meaning of this Act."* (Italics for emphasis.)

Federal Reserve Makes Money for Germany

IT IS extremely doubtful if any of those who had to do with the passage of this Act knew the ultimate objective of these words. If they did, it does not appear in the discussion. The authority was now in the hands of the Federal Reserve Board when the time should come for action. But the time had not come. The Schacht gold bank was incorporated *in Berlin* by special act of the Reichstag, *March 12, 1924.* Mr. Warburg announced to Europe and especially to Germany, through Reuter's News Agency, *on April 24, 1924,* that the International Acceptance Bank in America had established an American banking syndicate for the granting of unrestricted credit facilities to the new German gold bank.

The move for putting into actual operation the authority granted to the Federal Reserve Board began at a meeting of the Advisory Council held in Washington, May 14, 1924. It will be remembered that Mr. Warburg himself is chairman of the Advisory Council. Resolutions drafted by Mr. Warburg and afterward redrafted by himself because the originals were not entirely acceptable to some of the members of the council, were passed, asking that the Federal Reserve Board take every possible step to aid in the financial readjustments incident to the creation of the German bank of issue (that is, the Schacht gold bank which was ready for business) proposed in the Dawes Report. The Dawes Report had as yet been accepted by nobody! The confidence with which acceptance of the Dawes Report was postulated passes belief!

> With the Federal Reserve Bank as a final buffer for the absorption in this country of Schacht gold bank acceptances, this form of paper becomes very valuable to American banks and increases the market manyfold. Member banks could rediscount them at the Federal Reserve and change frozen into liquid assets. Keep in mind all the time that Schacht gold bank acceptances will reach this country only through the International Acceptance bank.

Credit for Germany's Overlords

THE organization of Mr. Warburg's syndicate to create credit for Germany's Jewish overlords was announced in the papers on April 26, and the amount named as being available for credit was given as five million dollars. On June 12, it was "officially" announced by Mr. Warburg's bank that a new syndicate had been formed comprising thirty-four banks "covering the main centers of the United States from the Atlantic to the Pacific" and that the Schacht bank credit had been increased to twenty-five millions. *The principle had been established.* It opened the way for the rediscount of German trade bills in unlimited amounts.

> Nor is the system confined to German bills and acceptances but the same facilities are available to banks of issue of all other recognized commercial countries.

This point is important in the light of what is to follow. The same Federal Farm Loan Act of 1923 which carried authority to the Federal Reserve Board to determine the nature of the paper which might be rediscounted in Federal Reserve banks, also carried another amendment to the Federal Reserve Act.

> Upon the indorsement of any of its member banks, which shall be deemed a waiver of demand, notice, and protest by such bank as to its own indorsement exclusively, any Federal Reserve Bank may, subject to regulations and limitations to be prescribed by the Federal Reserve Board, discount notes, drafts, and bills of exchange issued or drawn for an agricultural purpose, or based upon livestock, and having a maturity, at the time of discount, exclusive of days of grace, not exceeding nine months, and such notes, drafts, and bills of exchange may be offered as collateral security for the issuance of Federal Reserve notes under the provisions of section 16 of this Act: *Provided,* That notes, drafts, and bills of exchange with maturities in excess of six months shall not be eligible as a basis for the issuance of Federal Reserve notes unless secured by warehouse receipts or other negotiable documents conveying or securing title to readily marketable staple agricultural products or by chattel mortgage upon livestock which is being fattened for market.

In other words, *Federal Reserve notes may, under certain circumstances, be issued against German credit paper. Issuing paper money against credit paper is a feature borrowed from the Reichsbank charter and is the feature which enabled the bank of issue of Germany to depress the German mark to zero.* It is a truism of economics that expansion of credit, which is always easy, leads to expansion of circulating money, and this in turn to inflation.

The Right to Do Business Direct

WITH this authority in existence what is there to prevent manipulation for personal interests of the credit-money system?

I asked a banker friend of mine, and his reply was: "The country banker. He watches the volume of paper currency like a cat watches a mouse."

"Suppose he gets caught in a system wherein he cannot help himself, or his protests are of no avail? What then?"

"Nothing," was the answer.

What the politicians of Europe in diplomatic correspondences and prolonged and costly parleys and conferences were unable to do, one clever German Jew with a bank—not a very large one either—succeeded in doing with neatness and dispatch. He has done it not with Jewish money but with Gentile money.

I am reminded of what William Z. Foster, the Communist, said before the Bridgman convention which was raided by the Federal authorities in August, 1922: "Communists get things done and paid for by others."

If there is any real help for the German people, it will not come through financing Jewish bankers and industrials which are their overlords. It will come by giving the real German nationals themselves a chance. The opportunity is here, and they are taking advantage of it. During the past eighteen months, there have come to America an increasing number of German industrials of moderate resources who desire to shake the system and get on their own feet. They have been doing business directly with a few New York banks with which they have established their credit, and in which their paper, including acceptances, have been promptly discounted. American business men have a right to demand the privilege of doing business with Germans face to face, and not exclusively and compulsorily through the Warburgs, et al.

Mrs. Barnes, who is the great-granddaughter of Benjamin Franklin, is here shown with Frederick Warde, the actor. Inset—Mrs. Barnes, who is ninety-one years old.

Franklin's Aged Descendant Likes Her Poor-Farm Home

By HARRY H. DUNN

WITH ninety-one years of life behind her, and happy to spend the "next ten years" amid the surroundings provided by organized charity, a great-granddaughter of Benjamin Franklin is ending her days on the far western rim of the Republic her illustrious ancestor helped so largely to found and to maintain. She is Mrs. Caroline A. Barnes, who was born March 21, 1833, forty-three years after the author of "Poor Richard's Almanack" had passed away. To her, the life and the deeds of the discoverer of the Gulf Stream and the father of modern applied electricity are almost as much of mere history as they are to the average schoolboy, though she still retains the memory of certain sayings attributed to Franklin, which, she claims, never have been published.

Bright-eyed and clear-minded, Mrs. Barnes has refused offer after offer to leave her place in the Los Angeles, California, county farm at Downey, where she finds her pension of $30 a month from the National Government sufficient for all her needs. "If I went away," she says, "I should be lonely for the friends I have made here, and loneliness is the surest friend of death, the enemy of happy old age; unless they make me go, I shall never leave this place." Fortunately, there is no intention on the part of any one to "make" her leave her place in life at the county farm, though funds have been raised and are waiting to put her in a rose-covered bungalow in Southern California, with an elderly woman as a companion, if ever she changes her mind.

"Contentment," Mrs. Barnes said to me, when I last saw her a few days ago, "is a mixture of industry and idleness. I work and I loaf; just enough, and not too much, of each. Here, they let me work when I want to work; if I went away from here, they wouldn't let me work at all, and all rest and no work will rust the best engine. I expect to live at least ten years longer, for I want to see all the wonders and changes of a full century between my birth and my death.

"I am the youngest of fourteen children, and my father, Thomas Mervin, lived to be 102 years of age. My mother, Charlotte Bach—they called it Bash in those days—died when I was 2 years old. My mother's father was Richard Bach, a composer and singer of Philadelphia, and founder of a chorus or company of singers, which in those days numbered 100 persons, a large musical organization for that period. My grandmother, Mrs. Bach, was Sarah Franklin, daughter of Benjamin Franklin, and thus I became one of the few remaining direct descendants of the man who contributed most largely to the drawing up of the Declaration of Independence."

Mrs. Barnes was the third wife of William Barnes, a veteran of the Civil War, a private in Company B, Twelfth Regiment, Pennsylvania Volunteers, according to her records. After seventeen years of effort, aided by prominent Pennsylvanians, she succeeded in getting a pension of $20 a month from the Federal Government. This has been since increased to $30 a month, by act of Congress.

"This is all the money I need to live on," Mrs. Barnes continued. "In fact, there is seldom a month at the end of which I do not have some money left over. I often think of an expression my great-grandfather used regarding economy, in one of his letters to my grandmother. Most of his discoveries, both in science and in philosophy, were put into his letters to his relatives and friends. He said, 'The economical man is like the trained carpenter, who smoothes down the edges of two short boards and gives them the appearance and usefulness of one long board. That is, he trims his income to meet his expenses.' Of course, I never knew Ben Franklin; he died more than forty years before I was born, but I have seen a great many of his letters. I remember one comment he made on marriage, in a letter to a granduncle of mine, which was my mother's at her death, and which I inherited. He wrote:

"'Marriage, my dear relative, is to a man like a graft on a tree; if the tree does not take the graft to heart, then the combination cannot bear fruit.'

"I am like my great-grandfather in only one respect—he was the fifteenth child in a family of seventeen, and I was the fourteenth child in a family of fourteen."

Mrs. Barnes tells of her going to the Pacific Coast as follows:

"I had been living in Vineland, New Jersey, when a woman in Pasadena wrote to me, telling that she had heard of my relationship to Benjamin Franklin, and asking me to come to spend my last years with her. I left Vineland, but when I arrived in Pasadena, and this woman found that I had no funds, she lost interest in me and in my ancestry—possibly because I was unable to assure her that she, too, was a descendant of the signer of the Declaration of Independence. So I left them one evening, and started to walk to Los Angeles."

It is about nine miles from Pasadena to Los Angeles, and, on the road, the aged Mrs. Barnes was found by a Mrs. John Vail, of Pasadena, who speedily learned that she could do nothing for the independent old lady, and so took her to the county farm at Downey. There she was found—not by the printers' organization, as one would suppose, since Ben Franklin is almost a patron saint of the workers with the stick and rule—but by the bakers' association of Los Angeles, and presented to the world on Franklin Day of Bread Week. Funds were raised immediately to provide for her home and future away from the county farm, but when the matter was mentioned to Mrs. Barnes, the proposal met an emphatic negative. She declared that at last she was contented, happy in her surroundings and with the friends she had made at the county institution, and that, most of all, if she left that place, her opportunity to work every day would be taken away from her, and that she had no desire for a "life of idleness."

"William Mervin, an uncle of mine, was a rear-admiral in the United States Navy," Mrs. Barnes continued with the history of her family. "I do not remember exactly the date of his service, but his home at the time was in Utica, New York, and he had letters from Ben Franklin to his father. In one of these letters, I remember, my great-grandfather advised his nephew to 'remain away from the sea, which ultimately destroys men and ships.'"

Mrs. Barnes entered the county farm October 1, 1923, and has been there since. It seems probable, if she is allowed to follow her own inclinations, that she will remain there the remainder of her life, which she plans will equal, if not exceed, the number of years her father remained on earth. She has a badge of membership in the Ladies of the Grand Army of the Republic, the organization of veterans of the Civil War, and also claims to be a member of the Women's Relief Corps, another similar society. But her greatest treasure is a costume patterned after those worn by the women of Revolutionary Days. Occasionally she dons this, and entertains the other inmates of the farm with stories of the closing days of the eighteenth century, which were handed down to her by her grandmother and her father.

Many of the details of her early life are lost to her memory, but she recalls with ease incidents which have been told her of the life of Franklin. Inasmuch, however, as none of these incidents are different from those told in books written about Franklin, particularly Bigelow's interesting work, it is possible that she obtained them from reading these volumes. In the long years that have passed it is not improbable that she has so incorporated these incidents into her own thoughts that she believes they were told to her by the direct descendants of America's first ambassador to Europe.

The most striking characteristic of Mrs. Barnes appears to be her unceasing industry, and her ability to move about with comparative ease and without assistance. She claims to have, in her former home in Vineland, a number of relics, letters and personal belongings of her illustrious ancestor, but her memory as to their exact whereabouts is hazy, and if she has any such relics in her possession at present, she seems not to know where they are or of what they consist.

Stories Our Log Books Tell

Concluded from page 11

well-directed that the guns of the *Macedonian's* starboard battery were dismounted and the gun deck turned into a shambles from the effect of grape and canister. The ship itself was being rapidly dismantled. The forecourse was shot to ribbons, the fore and main topmasts hung over the side, the mainyard was cut away in the slings, and the foremast was tottering. At 10:45—an hour and a quarter after the commencement of the engagement—a shot carried away the mizzenmast about ten feet above the deck. All the men on it were lost.

Carden decided to try conclusions hand to hand. Calling away his boarder from the guns, he ordered the helm put hard aport and prepared to board. Just then a shot carried away his forebrace. The yard swung round throwing the ship up in the wind, exposing her to a raking fire.

The *Macedonian* was helpless, drifting down nearly before the wind. Decatur, filling his mizzen-topsails, gathered fresh way and tacked. Heading up high, he easily crossed the *Macedonian's* wake, his men still manning the larboard guns. His cannonade at this moment was particularly heavy and for a few minutes the *United States* was enveloped in smoke and flame. The *Macedonian's* crew thought she had caught fire and sent up three rousing cheers. But they soon discovered their mistake.

A few minutes more and the *Macedonian* was little better than a mastless wreck, rolling helplessly in the sea. The long swells washed over her main-deck battery. Her fore and maintop mast and mainyard were down. All her boats were smashed. Two guns of the main battery and all but two of the forecastle and quarter-deck guns were disabled. More than a hundred shots had found a place in her hull. The carnage among the men was terrible.

Decatur had suffered somewhat himself. Having reduced the *Macedonian* to such a plight, he hauled off to reeve new rigging and secure the lasts. This took about an hour. At noon, under easy sail, he bore down across the stern of the *Macedonian* prepared to renew the action. But Carden had had enough, and struck his flag. He had met one of the "inexperienced" Americans, and in a clean give-and-take encounter lost his ship. He was outmaneuvered and outfought.

Decatur hove to and dispatched Lieutenant John B. Nicholson to receive her surrender. Carden returned with him. Decatur was awaiting them on the quarter-deck. It was a touching scene. With a dignified grace, the gallant Englishman stepped forward and tendered his sword as token of defeat. But Decatur declined it, saying:

"Sir, I cannot receive the sword of a man who has so bravely defended his ship. Give me your hand."

Decatur placed Lieutenant Allen aboard the prize. During the rest of the day, and Monday and Tuesday, too, the two ships lay side by side. All hands were busily employed transferring prisoners and baggage and in making repairs to the *Macedonian*. A jury mast was rigged up for her. The damage to the *United States* was not enough to make it necessary for her to return to port, but Decatur considered the capture so important that he thought it best to accompany her to the States.

After little more than a month, December 4, the vanquished frigate limped into the port of New Haven. Decatur was greeted with the utmost joy, and a large ball was given in honor of his exploit. His first act was to dispatch Lieutenant Hamilton to Washington with the *Macedonian's* colors, which, together with the figurehead, are preserved at the Naval Academy at Annapolis, and his report of the engagement.

The prize was then taken to New York. Its arrival was the occasion for great public dinners and receptions. Congress voted Decatur a gold medal and a sword. Lieutenants Allen and Hamilton also received swords, and each officer a silver medal. The crew got a nice piece of prize money—not to mention public dinners.

As for the *Macedonian*, she was refitted and under the same name had a memorable career in the United States Navy.

Not long after arriving in the States, the *United States* was caught in Boston Harbor by the British blockade, which held her and a number of other American ships cooling their heels until the end of the war, 1815.

One Sunday, an old tar from the *United States*, chafing under the enforced inactivity, went ashore to church. The text of the sermon was "Fear God and honor the king." Like many ministers this one repeated his text a great many times. At last it got too much for the veteran of the *United States*. Jumping to his feet, he shouted:

"Fear God and honor the Congress—let the king alone."

The congregation was scandalized, and several men nearby remonstrated.

"Oh, choke your luff," exclaimed the old salt, "if the lubber says so again I'll pull him out of his bunk."

The only ship to slip through the blockade was the sloop *Hornet*.

BRIEFLY TOLD

In the United States there is a doctor to every 724 persons; England has one to 1,087 persons; while Central Europe has only one doctor to every 2,000 to 2,500 persons.

Gamaliel Ratsey, a notorious bandit whose deeds amazed England during the sixteenth century, always wore a hobgoblin mask which he made as hideous as poss.ble to terrorize his victims.

It has been estimated that it costs the American people $30,000,000 or at the rate of 80 cents a vote to conduct a national election.

The largest American educational institution in the Near East is the American University of Beirut, Syria.

Yellowstone National Park was discovered in 1807 by John Colter, a trapper, who brought news of it to St. Louis, where his story was doubted. Later, he was acclaimed the discoverer of "America's Greatest Wonder."

The forum in Rome is said to have been the point of convergence of twenty-four roads during the time of the Roman Empire. These roads and their branches had a total length of 52,904 Roman miles. They learned the art of road building from the Carthaginians.

Tuscon, Arizona, is the only walled city in America. The wall, which at one time encircled the entire city, is in ruins at this time.

Antonio and Joseph Mungo, of New York City, specialists in illumination, have just completed an illuminated copy of "The Sonnets from the Portuguese," on which they have been working for ten years. It is an exact duplicate of early Renaissance work and is to be presented to the Metropolitan Museum of Art.

The United States adopted the eagle as her national emblem in 1783. It is also the ensign of Germany and Russia.

Footprints of dinosaurs have been found in Neskla-Nizadi canyon in Northern Arizona, by the C. L. Bernheimer expedition of New York. The ground in this region is petrified and at least thirty traces of three-toed animals are easily perceptible.

After a study of the biographical sketches of people who appear in the 1923-24 edition of "Who's Who in America," it has been found that 25.9 per cent of present-day American notables were born on farms; 24.5 per cent in villages and towns; 24.8 per cent in small cities; 20.6 per cent in large cities and 4.1 per cent in suburbs.

Plans for a highway from New Orleans to Portland, Oregon, which will follow as nearly as possible the boundary lines of the old Louisiana Purchase, have been officially launched. It will commemorate the purchase of the territory by the United States.

Three times as much snuff was sold last year in New York City as in 1897, which may indicate that snuff-taking will again become popular.

"Injun Joe," who was said to be the famous character in Mark Twain's story of "Tom Sawyer," died recently at the age of 102. He had wandered up and down the Mississippi River for seventy years.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

During his lifetime John Wesley preached 27,000 sermons. Canon Hay Aitken, England's greatest revivalist, who hopes to surpass that record, has preached 22,000 sermons.

There are still 800,000 war veterans on the unemployment list in England.

Enrollment in American colleges will total more than 300,000 this year, which is a record in increased attendance. The largest enrollment is at Columbia which has 35,000 students. In 1900 the total enrollment in colleges and universities was 115,271; in 1910 it was 184,712; in 1915 it increased to 237,168; and in 1918 it reached 290,106.

Efforts are being made by members of the veterans of the Navy and Marine Corps for the preservation of *"Old Ironsides,"* which is reported to be disintegrating at the Charlestown, Massachusetts, navy yard.

The Vincennes fortress, which is located outside of Paris, is to become a war museum. According to legend, it was here that the "Man With the Iron Mask" was imprisoned. It also served as a prison for political offenders under the Bourbons.

Spain's first woman mayor has taken office at Cuayatre Tondeta, in the district of Concentaina. She is Marie Perez, and her election is considered significant, because Spain has no law giving suffrage to women.

In Prague, Czecho-Slovakia, there is to be found a button museum in which every type and form of button ever manufactured or wrought by hand is on exhibit. The museum was founded by Henry Waldes, a button manufacturer.

Although it has been customary for the heirs of the throne of Great Britain to marry nobility, the Prince of Wales could lawfully marry a commoner without its affecting his inheritance of the Crown.

Ezra Meeker, ninety-four years old, flew from Vancouver, Washington, to Washington, D.C., over the trail he covered in 1852 in a wagon train. It took him five months to make the journey in 1852 and the return trip, piloted by Lieutenant O. J. Kelley, was made in twenty-four hours, flying time.

The Rock of Gibraltar, commonly called the "Watchdog of the Mediterranean" is about 1,437 feet high.

Paris has decided to retain several of the buildings erected for the Olympic Games, which were held there last summer. The Colombes Stadium will become the property of the Racing Club of France and it will be the scene of all the international Rugby and soccer matches as well as the finals of the French football leagues. The swimming pool and stadium at Les Tourelles will be taken care of by the city of Paris and will be thrown open to the public. The tennis and polo stands at Saint Cloud will be destroyed.

Minnehaha, the Indian maiden, is buried at De Soto, Wisconsin, on the crest of a hill overlooking the town. Many persons believe that she was buried in Minnesota where the Minnehaha Falls are located, but this is not so.

In Europe it is permissible to have the policeman on beat in the residential districts act as call boy. As a result, many policemen call those who desire to be aroused at a certain time if it does not conflict with their official duties.

Jean Patou, a French manuscript collector, is presenting as a gift to the American Government letters written by Lafayette and letters written to him by American admirers during the American Revolution.

In view of the fact that the South for years stood firmly against woman suffrage, it is interesting to note that Georgia sent the first woman to the Senate and Texas was the first state to nominate a woman for governor.

Forty years ago the total assessed valuation of New York State was about $3,000,000,000. Last year New York City's valuation increased more than half that amount, to a total realty settlement of $13,145,000,000.

One of the issues of Uncle Sam's 20-cent air-mail stamps got into circulation with an error, the airplane pictured flying upside down. Only 100 slipped by the inspectors, and while their real value is absolutely nothing collectors are paying as high as $700 for them.

Seaweed has a variety of uses. Green dye is obtained from the weed found on the Welsh coast and a Japanese seaweed provides a fiber which can be spun and woven like cotton. Packing is made from the weed in Sweden.

Although London is less than six hundred miles from Berlin, a telephone conversation between the German and British capitals will be made possible soon for the first time.

The first grain drill was invented seventy years ago by a man named Harcourt living near Rushville, Indiana.

Letters of George Washington, captured by the British General Clinton, and held for generations by his family, are to be auctioned off in London.

A heavy dripping fog rolling in from the Pacific Ocean put out effectively a fierce forest fire which had been burning for days in the Olympic peninsula southwest of Port Angeles, Washington, recently.

Sweden prohibits the killing of eagles. This is the result of the efforts of "Sweden's John Burroughs," Bengt Berg, who has aroused great enthusiasm through his films and books.

CHRONICLER OF THE NEGLECTED TRUTH

Our Fundamental Purpose

The real fundamental purpose of THE DEARBORN INDEPENDENT is to serve as a medium for the dissemination of sound ideas.

This publication does not cater to its readers, but honestly trys to present for discussion those problems which require public attention.

By stimulating thought and discussion among its readers it achieves the main thing necessary to correct existing evils.

Subscriptions will be accepted by any Ford Dealer, or may be mailed direct by means of the accompanying form.

Shall the American Child Be Federalized?

New Amendment Takes Control of Child, Not of His Conditions: An Analysis; Some Dangers of Bureaucratic Methods in Dealing With Juvenile Labor

By IREDELL MEARES
ATTORNEY-AT-LAW, WASHINGTON, D. C.

In this article the writer discloses pertinent facts concerning the latest attempt to tamper with the Constitution.

THE Washington (D. C.) *Star* publishes a synopsis of a textbook issued by the advocates of the Child Labor Amendment to the Constitution of the United States "definitely contradicting statements" of its opponents, it is claimed, and in defending the amendment the textbook says:

1. The proposed amendment is an *enabling act,* not a statute.

No one claims it to be a statute. It is worse. Statutes can be repealed. Not so easily a constitutional law. It is a grant of power. But who ever heard of a constitutional power being an enabling act? Every intelligent person knows the Constitution, and the laws made in pursuance thereof, is the supreme law of the land. It supersedes and overrides all state laws. Even by the second section of this amendment it is provided that the state laws shall remain unimpaired, which would be true, whether stated or not, except when necessary to give effect to this amendment and statutes made pursuant to it by Congress. To say it is an enabling act is manifestly a misleading statement made for effect.

Regulates Labor, Not Employer

2. This textbook claims it grants power to Congress to make laws against the exploitation of childhood.

It does not. Congress under it *can regulate the child* in his labor *but not the employer* in his employment, except negatively in prohibiting the child by directing how, when and where he may work, and neither "child" nor "employment" is mentioned in the proposed amendment.

3. To fix a minimum standard for the employment of children is another claim.

Not at all, except to say to the child that he may not under a certain age engage in work, but, if he does so engage, no act under this grant could attach a penalty to the employer who might employ such child under the prescribed age. It is the *child's labor,* not the person employing it, which it may limit, regulate and prohibit. In fact, the proponents of the bill, when considered in committee, objected and had discarded from the proposed amendment the words—*child* or *employment.*

4. To prevent employers sending work across state lines for children to do, or to employ children who migrate from one state to another and "to enable Congress to protect high standard industries with good child labor laws to protect their children against low standard industries and backwood states"; but this it could do only by prohibition of the labor of minors under eighteen, not by imposing fines upon low-standard industries so as to compel them to raise their standards. There is no grant of power to regulate industries or to prevent the shipment of goods from state to state for any purpose. It might prohibit any person under the age of eighteen from labor on goods so shipped, after such goods had reached the state of the person's labor. No grant of power is given to regulate such shipments, if for such purpose ever made, or to impose penalties upon shipper or transportation company.

Confidence, the Parent of Despotism

5. It is not, says this textbook of errors, a regulatory measure and does not itself prohibit or regulate anything.

No, but it grants the power to Congress, and, if granted, Congress may enact laws to execute the power. Every advocate in committee of this proposed amendment urged it so as to enable Congress to legislate and knowing such legislation would supersede all state laws, now existing or hereafter made, if in conflict with any act of Congress upon the subject. Of course, if adopted, Congress might not pass any law on the subject and the power conferred might remain dormant, but Congress will probably do so, if given the power, and that is the purpose of the amendment.

It is said we can have confidence in Congress and rely on its exercising the power wisely; but let us recall and act upon the counsel of Thomas Jefferson who said "confidence is everywhere the parent of despotism—free government is founded in jealousy; not in confidence—it is jealousy and not confidence which prescribes limited constitutions."

Will the mothers of this land vote to confer upon Congress the power to limit, regulate and prohibit the labor of their children under eighteen years of age? Consider the question in terms of *your own children,* Mothers of America, not in terms of *other people's children,* and then act and vote as mother love, mother conscience, dictates! If this power is granted, Congress will exercise it, and then we shall have regulations prepared and prescribed by high-salaried philanthropists, at Washington, directing all persons under eighteen *when* to labor, *how* to labor and *where* to labor, even *not to labor,* whether that labor be for gain, pleasure or in unrequited service to parents!

6. It is not contemplated, this textbook says, to regulate the labor of domestics, like girls who may go out to work in homes or who work at home with their mothers, without compensation but in co-operation with the family.

If not, why did not the proposed amendment limit the power of Congress to regulate the exploitation by employers and conditions of labor in factory, mill, mine, or other places where children are employed, and except those engaged in domestic service? *The amendment includes all occupations of every kind, whether for or without compensation, beneficial or deleterious either to health or morals.*

7. It exempts no occupation this textbook admits—it could not do otherwise—it would explain, because the place to make exemptions is in the law which Congress will enact.

Destroys the Power of States

WHEN, however, the Senate rejects a motion, as it did, to exempt "those engaged in outdoor employment" and another to limit the power to those "who are engaged in occupations other than agriculture or horticulture," may it not be said that it is contemplated Congress will enact, if the power is given, a law to limit, regulate or prohibit the labor of all persons under eighteen who are engaged or want to engage in such pursuits?

8. "It takes away no power the states do not now have" is the inexcusable misstatement of this textbook.

If not, and it is not its purpose, what is the reason for the amendment? The moment Congress enacts a statute "to limit, regulate or prohibit the labor of all persons under eighteen years of age" all state laws in conflict must give way and the Federal statute becomes the supreme law of the land. At present the states have exclusive power to legislate, within reasonable limits, as to the welfare of their children, each within its own borders. Congress has no such power.

The amendment proposes that the states surrender this power and confer it upon Congress, and, if adopted, the states could pass no law in conflict with any act Congress might enact in pursuance of the power granted. THE POWER THUS PROPOSED TO BE GIVEN IS ONE NO STATE LEGISLATURE COULD EXERCISE OVER "ALL PERSONS UNDER EIGHTEEN" WITHOUT HAVING HAD IT EXPRESSLY GRANTED TO IT BY THE PEOPLE IN THE CONSTITUTION OF THE STATE. There is no state in the Union whose people have conferred such unrestricted power upon its legislature by constitutional grant.

It was proposed in the Senate to strike out the words, "That Congress shall have the power to limit, regulate and prohibit the labor of all persons under eighteen years of age" and, instead, to provide that "The Congress shall have the power reasonably to limit and regulate the labor of persons under eighteen years of age and to prohibit such in pursuits involving special hazards to health, life and limb," but the proposal was voted down.

Born in Russia, Exported to U. S. A.

SENATOR FLETCHER has well said that "refusal on the part of those responsible for the introduction of the proposed amendment to consent to the adoption of these amendments *clearly indicates their influence, intentions, and what may be reasonably expected in the way of legislation* should Congress be granted the power to "limit, regulate and prohibit the labor of all persons under eighteen years of age."

Senator King, of Utah, speaking in the Senate on the question, said: "If the Senator from Delaware will pardon me, every Bolshevik, every extreme Communist and Socialist in the United States is back of the measure. The Bolsheviks of Russia were familiar with the scheme that was about to be launched to amend our Constitution.

"In conversation with one of the leading Bolsheviks in the city of Moscow, one of the educators, when I was there last September and October, I was remonstrating with him about the scheme of the Bolsheviks to have the state take charge of the children: 'Why,' he said, 'you are coming to that' . . . . 'A number of Socialists in the United States,' and he mentioned a number of names but I shall not mention them here, 'are back of the movement to amend your Constitution of the United States, and it will be amended, and you will transfer to the Federal Government the power which the Bolshevik is asserting now over the young people of the state.'"

We are further told in their textbook that this proposed amendment "does not prohibit the labor of children up to eighteen nor does it contemplate a Federal law containing a general prohibition up to eighteen years."

Reaching After the Child

THIS assertion is mere camouflage and a gullible public is relied on to accept it, as if the amendment does not in itself manifest its intention. If not contemplated, why did the proponents of the measure so make it read?

So it is the child, not the employer of the child, after which the proponents of this measure are reaching, and expecting, if Congress is granted the power, that by gradual legislation, here a little and there a little, effected by influencing the passage of bills, or amendments adopted in committees upon recommendation of bureaus and passed without understanding by members of House or Senate, that ultimately the Federal Government will control the persons under eighteen by limiting, regulating and prohibiting their labor.

It is my judgment, backed as this amendment has been chiefly by persons identified with Sovietism and Socialism, that it is the foundation which has been laid for subjecting the youth of this country to control by the Federal Government under the pretense of protecting child labor and providing for its welfare.

As the persons identified with this movement have been able to lead Congress to the submission of this proposed amendment, so they hope by appeal to sentiment to enlist the support of a sufficient number of states to adopt it and, if so, to influence Congress from session to session to secure the passage of legislation which will gradually enable them to accomplish their ultimate designs. As no time limitation has been placed in the act within which the states shall act, if they fail to get it adopted at this time, agitation will continue so as to induce the states, now rejecting it, to reverse their action and ultimately to secure favorable action of a sufficient number to adopt the amendment.

It is worthy of note that the President of the American Child Hygiene Association, at the hearings on the Physical Education Bill, January 12, 1921, declared that "the child is not private property to be controlled and treated at the will of the parent but public, belonging to the public, and must be brought up for the good of society," and Mrs. Florence Kelley, a recognized leader in so-called social welfare legislation, and the chief promoter of this amendment before the Senate Committee, said, "It is unsafe to leave children to the tender mercies of the pressure of ignorant parents."

The Milk in the Cocoanut

IT IS only necessary to review the hearings in committee and to know the records of its proponents to realize the above-quoted words reflect the views of the majority of them. It is claimed eighteen women's organizations are back of this proposed amendment. Would it not be more accurate to say eighteen self-constituted leaders?

Having a constitutional proviso "to limit, regulate and prohibit the labor of all persons under eighteen years of age," we will have a law by Congress; having the law, we will have a bureau; having a bureau, we will have welfare workers; having welfare workers, we will have rules and regulations; and the milk in the cocoanut is the creation of a lot of jobs at Washington for a self-created profession of non-productive laborers in the vineyard who call themselves social welfare workers.

Hiking around the country, bedecked with Federal badges, will be so-called experts on child labor, which will be construed to relate to all things pertaining to children if this twentieth amendment is incorporated in the Constitution of the United States. The power is there and, once given, it will be exercised, sooner or later.

How News First Got into the Newspapers

Italy the Birthplace of First News Sheet; The Story of America's Newspaper Press

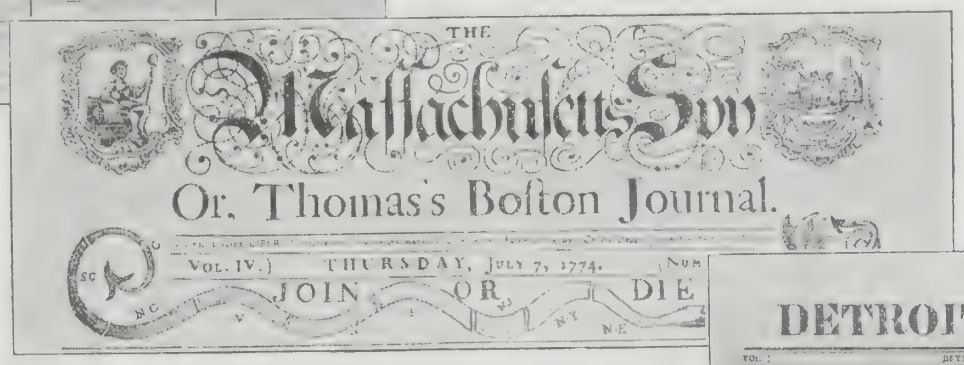
PUBLIC GOODS

The first daily paper issued in America. The *Packet* was a daily continuation of a paper issued before September 21, 1784, twice a week.



THE Massachusetts Spy

Or. Thomas's Boston Journal.

VOL. IV.] THURSDAY, JULY 7, 1774. [NUM

JOIN OR DIE

The Massachusetts *Spy*, 1770-1786. This was an important issue of the *Spy:* the first to contain the peculiar snake and dragon emblems of the Colonies and England, respectively. From 1775 on the paper was published at Worcester, Massachusetts, by Isaiah Thomas, sometimes called the father of American printing.

DETROIT GAZETTE.

DETROIT, MICHIGAN TERRITORY, FRIDAY, AUGUST 1, 1817

THE

KENTUCKE GAZETTE

SATURDAY, AUGUST 18, 1787.

The Kentucke *Gazette*, 1787-1848, published by John Bradford at Lexington (Transylvania), Kentucky. The first American paper west of the Alleghenies.

The Detroit *Gazette*, 1817-1830. Early Michigan newspaper. The first to enjoy any continuous circulation. One page was in French and the other three in English.

FOR many centuries and in many countries poetry was the medium through which news was spread. Commonly, too, music was employed. The bard, the ballad singer, and the minnesinger took the place both of the historian and the journalist. The purpose of the verse and song was to facilitate memorizing the events to be recounted. The professional newsmongers acquired the ability to memorize long and detailed accounts. In this art practice makes perfect as elsewhere.

Nearly a century elapsed after the invention of printing, about A. D. 1450, before some bright genius thought it worth while to put the happenings of the day immediately into print. This came first in Italy, which was then the great center where happened events supposedly worth recording. These Italian news sheets, usually on a single page, were called *Gazzetti.* The word *gazette* comes from a Greek word, meaning "treasury." The idea of a treasury of information from all the world appealed to many editors. In addition to the cheerful implication of "treasury," the word has real snap when pronounced. Both these points have made gazette long a popular term for a newspaper, particularly in England and Colonial America.

Another Italian term, *"coranto,"* was used for accounts of current events; the French term *"courant"* was also used, as well as the English "current." The first English journalistic efforts were called *"corantos."* "Relation" was a popular word, also, for the early news letters.

Another type of news enterprise consisted in a bound book recounting the events over a longer period of time. In 1594 there was published in Cologne, the *"Mercurius Gallobelgicus"* which contained 625 pages devoted to events from 1588 to 1594. Later volumes consisting of 50 to 100 pages appeared half-yearly up to 1635 and were much used by English printers for "relations" giving foreign news to which printers were restricted by law.

The first English news sheets were printed in Amsterdam in 1620 and 1621 and sent over to England. Possibly the presence of the English Puritans in Holland was connected therewith. These contained foreign news only. Probably the close censorship of the press in England largely accounts for their appearance in Holland. However, it is strange to relate that the first English books were also printed in Holland about 1478 by William Caxton, who a few years later became the first printer in England.

Real British journalism begins definitely with a pamphlet of 1622 entitled: "A Currant of generall newes. Dated the 14th of May last." A copy of the second issue, May 21, 1622, published in London like the first, by Thomas Archer and Nicholas Bourne, is preserved in the British Museum. Until 1640 these *"corantos"* appeared, frequently using the expression, "Weekly Newes of foreign affairs," but with no regular titles.

Names for the English news books began to be regularly employed about 1640. These titles correspond to many terms later employed in American journalism. Corresponding to the term Mercury we have the Oxford *Mercurius Aulicus,* meaning Court Messenger, of 1643, and the London *Mercurius Civicus,* beginning a little later in the same year, which was the first regularly to use illustrations, but rather crude ones.

The Kingdomes Weekly Post began in 1643 and continued for only two months, despite a good name. The *Spie* of 1644 had a similar fate. "A True and Perfect Journall of the Warres in England" appeared in 1644 while the popular title *Exchange* was used first in the *Exchange Intelligencer* of 1645. The *Mercurius Republicus* of 1649 enjoyed so far as known only one number. The *Mercurius Democritus* was twelve years behind the *Mercurius Populus* of 1647. However the *Democritus* survived about half a dozen issues whereas both *Republicus* and *Populus* survived apparently only one issue.

The real newspaper made its appearance in England with the Oxford *Gazette,* November 16, 1665. The preceding periodicals were rather news books whereas this consisted of a large single sheet whence it became known as a "paper" or a "paper of intelligence" and then "newes paper." The first use of the term was in a letter to the editor of the *Gazette,* Charles Perrot, written in 1670: "I wanted your newes paper Monday last past." With the twenty-fourth issue the name of the Oxford *Gazette* was changed to the London *Gazette.* This paper appeared twice a week and continues so to appear to the present day.

From the beginning of journalism the freedom of the press was again and again the subject of agitation. Countless English and Irish editors spent enforced vacations behind the prison bars; particularly the Irish editors in England and America had a gift for vigorous vocabularies. The story of the imprisonments of editors would involve a review of English history covering a fairly long period of time.

The first newspaper to appear in New England was entitled:

PUBLIC
OCCURRENCES
Both FOREIGN and DOMESTICK,

printed at Boston on Thursday, September 5, 1690. The printer was Richard Pierce, and the editor Benjamin Harris. The latter was a London bookseller who after a brief sojourn in America returned to London, probably soured on America by his experience. Immediately upon its appearance the legislative authorities "stated that it came out contrary to law" and that it "contained reflections of a very high nature." It was forbidden to put "anything in printing without license, first obtained from those appointed by the government to grant the same." Evidently the press was not to make its way more easily in the Colonies than in the mother country.

Fourteen years later (April 17, 1704), the Scotchman, John Campbell, postmaster in Boston and bookseller, began "The Boston *News-Letter.*" The imprint reads, "Boston: Printed by B. Green. Sold by Nicholas Boone, at his Shop near the Old Meeting House." Like many another editor Campbell was often in financial difficulties due to the inclination of the public to accept the paper as the gift of the gods, without money and without price. In 1719 Campbell attempted to enlarge the paper to a full sheet (four pages, 12 by 8 inches), but this did not meet suitable reward. Campbell says that he "cannot vend 300 at an impression, tho' some ignorantly concludes he Sells upwards of a Thousand; far less is he able to print a Sheet every other Week, without an addition of 4, 6, or 8 Shillings a Year . . . . (and that) giving his Labour for nothing."

The early English journals did not contain advertisements, but in the first issue of this Boston effort the following appears: "This News-Letter is to be continued Weekly; and all Persons who have any Houses, Lands, ... etc. to be Sold, or Let; or Servants Runaway, or Goods Stole or Lost; May have the same inserted at a Reasonable Rate, from Twelve Pence, to Five Shillings."

The *News-Letter* with some modifications of name continued to appear until after Boston was evacuated by the British in March, 1776, when it suspended as it had been a Tory organ through the siege.

The Boston *Gazette* was the second (or third) New England paper, continuing to appear until 1741. James Franklin appears upon the scene in Boston in 1721 with the New England *Courant,* the first exponent of yellow journalism in America. The governor and the clergy, particularly Cotton and Increase Mather, came in for vigorous but not academic discussion by the *Courant* editors, "a Hell Fire Club," as they were called. After about a year of publication James Franklin was "strictly forbidden" by the General Court "to print or publish the New England *Courant* . . . ." To avoid the difficulty the paper continued to appear in the name of the younger brother, Benjamin Franklin, then a printer's devil in his brother's shop. This satisfied the authorities and the paper continued for several years.

Some Fundamental Facts About Fiction

"Talk" and Characterization Are All Important in the Writing of Novels; Jazz Dialog Has Become a Feature of the Majority of Modern Stories

By THOMAS L. MASSON

A YOUNG woman who may be described as "a very nice young lady," and therefore representative of a large number, once told me that when she selected a novel in a bookstore, she turned over the leaves to see if there was much "conversation" in it. If there was, she bought the book. Observation and experiment have convinced me that ordinary people (like ourselves!) stick to this rule rather closely. Solid pages of type frighten us away. We expect the characters in a book to say something at once, and worth while. We do not care a great deal, even about the author's opinion of them. Indeed, if this is given in long passages of description, we are likely to lay back our ears and get ready to bolt. We count too much description as a distinct weakness. And we not only know what we want, but over long periods of time we are the best judges of true literary art. We are the ones who, from one generation to another, keep alive the good old books, which, in the very beginning, may have been "turned down" by the smart literary critics of their day as being too common.

"It was the custom of Scott," writes Bliss Perry in his "A Study of Prose Fiction," "to devote a page or two of personal description to each character at the time of its first introduction into the story. After this preliminary description of the personal appearance and costume of the character, Scott seemed to trouble his head no more about the matter."

The three American authors, writers of fiction, who appear to understand this rule best are Thomas Beer, Willa Cather and Ring Lardner. Beer opens his latest book, "Sandoval," with a short preliminary description, but on his first page are:

"Hey, is that spur silver?" . . . .

"Silver, ain't it?"

"I don't know."

Willa Cather, in "The Lost Lady" (issued last year), begins with six pages (they are short pages) of description, yet we are bound to admit they are easy reading.

"But we will begin this story with a summer morning long ago," she opens her second chapter. The boys see Mrs. Forrester, hesitate, and consult together.

"You ask her, Neil."

"You'd better, George . . . . She barely knows me—"

And so it goes. Willa Cather's indirect method of character development is perhaps more closely akin to that of Joseph Conrad's, than that of any other American writer.

In "How to Write Short Stories," Ring Lardner begins his first one, "The Facts," with a fake "doormat" description, which is really a satire on a publisher's blurb. "This story," he urbanely declares, "was written on top of a Fifth Avenue buss and some of the sheets blew away." Make no mistake about the story that follows. It is a good one. This, and all the others in the book, are not only real stories, but they are mostly all talk, even when they are composed of letters, as in the case of "Some Like Them Cold." The letters, essentially, are merely the utterances of the characters. What the girl writes to the fellow is a perfect delineation of her own character, only she doesn't know it; and this is genuine art.

Two other American works of fiction, both recent, reveal the morass into which a writer falls when he fails to understand the importance of talk. These books are "The Mirage," by Edgar Lee Masters, and "The Avalanche," by Ernest Poole. These writers are distinguished American novelists. Mr. Poole, in particular, has earned a respectable reputation through his powerful book, "The Harbor," although even this book, as I now recall it, is too descriptive. Mr. Masters achieved his enviable place through his "Spoon River Anthology." In "The Mirage," the dialog, although in spots clever enough, is about on the same low level of dullness achieved by Mr. Poole. Both have made the too-common mistake of inflicting the reader, through their characters, with their own views. On the other hand, Struthers Burt, in his first novel, "The Interpreter's House," an astonishingly well-written book of New York society, has erred on the other side, in making his dialog too clever, putting into the mouths of his characters a vocabulary which is entirely above them.

The Value of Talk

IF WE now turn, more or less casually, to two British writers, we shall see the value of talk brought out. H. G. Wells' last novel, "The Dream," contains nothing new, it being only a variation of the well-matriculated Wellsian formula. What the characters say is said in such a way that Mr. Wells' well-known views about things in general are, so to speak, relieved solely because he makes his talk interesting. This, naturally, does not excuse him from mixing up his propaganda with his art. But the talk lifts the book above the ordinary. So with May Sinclair's "A Cure for Souls," it is her clergyman's way of talking that gives him his reality. It would be unfair to assert that the dialog in these two books is necessarily any better than in, say, certain books of our own Booth Tarkington or Edith Wharton. Nevertheless, Americans are undoubtedly handicapped by the disadvantage of having transplanted their mother tongue to another soil. For instance, after the age of Pericles, most Roman writers acquired an intimate knowledge of Greek, but thus diffused, Greek lost its power. The English language, with its three elements, Anglo-Saxon, Norman and Latin, was welded together by the Island people over generations. A language seems to require intensive nursing for a long period to bring out its strength. And if on the British side, we go back as far as Jane Austen, and on the American side to Nathaniel Hawthorne, who was our first American novelist of note, and compare the fiction written on both sides since they wrote, we shall realize at once that the British dialog all along is by far the better. There are reasons for this, aside from the one I have mentioned. We are much more loosely held together, geographically and racially. It seems to be difficult for our writers to create a kind of dialog that is basic—that is to say, that springs from the soil, when the soil is so diverse. (In drama, perhaps the best result has been achieved by Eugene O'Neill; in poetry by Vachael Lindsay or possibly Robert Frost.) Thus we see that the talk of the Middle West, as shown in the works of Booth Tarkington, Ring Lardner, Theodore Dreiser, Sherwood Anderson and a number (or school) of other writers, is about the only exclusively American talk to which we can lay claim as a national possession. The Negro dialect, it is true, has been handled with much skill by a group of southern writers, Harry Stillwell Edwards perhaps being the best. Mark Twain never made much of the raw speech of the West and at present, if we wish to know the depths of philological depravity achieved by certain "literary" artists, we have only to witness some western screen melodrama, and writhe under the cowboy dialog thrown on the screen. In comparison with this crude stuff, how refreshing is the poorest kind of cockney. In connection with this, it is interesting to observe that in the works of three American writers of fiction whose books are declared to outsell all others, namely, Zane Grey, Gene Stratton Porter and Harold Bell Wright, the talk is all commonplace, everyday talk; and that largely accounts for the success of these writers. Here is a fair sample from Harold Bell Wright's last book "The New Neighbor":

"I ain't blind, be I?" answered Bob. "An' wouldn't she take notice? My gal ain't no wizened-up old mummy like me an' you. Why shouldn't she take notice of a fine, up-standin', clean-eyed, straight-limbed fair-spoken youngster like him, heh? It's nateral enough—an' right enough too, I reckon."

An Example of Jazz Dialog

HERE we have a perfectly obvious method, where direct description is avoided, by making a character describe another. To sensitive literary ears this all sounds commonplace. But it is popular because it drips with raw sentiment, and deals with universal traits.

Apropos of the ordinary tone of some of the best sellers, Arnold Bennett ("The Author's Craft") has this to say:

"It is a hard saying for me, and full of danger in any country whose artists have shown contempt for form, yet I am obliged to say that, as the years pass, I attach less and less importance to good technique in fiction. I love it, and I have fought for a better recognition of its importance in England, but I now have to admit that the modern history of fiction will not support me." He goes on to show the clumsiness of the best writers of fiction—Balzac, Stendhal, Dostoievsky, and adds:

"I begin to think that great writers of fiction are, by the mysterious nature of their art, ordained to be 'amateurs.'" In this he is borne out by Anatole France:

"Now what is a scholar?" exclaims France. "A deadly creature who studies and publishes on principle everything that is fundamentally uninteresting." He then adds:

"All great authors write badly. That is well known . . . . To the pundits good writing apparently means writing according to the rules. But born writers make their own rules, or rather make none."

In this country, within the past few years, we have developed what may be termed a jazz dialog, the source of which I think may be traced to Scott Fitzgerald, a young man who, in spite of his defects, is a marked genius. This talk is a new kind, born doubtless of war decadence, which overlays the racial strata, exotic and enormously clever, much more clever indeed than we realize. For as British critics have severally pointed out, we Americans have a true genius for catch phrases, slogans—the spontaneous creative skill to condense a whole atmosphere in a sentence or even a single word. Thus, to the substance of this sort of thing we give the word "snappy"—perfectly expressive of a mixture of university slang and "go-getting" Americanism. Make no mistake: as bad as this may seem to the so-called intellectuals, it is much more wholesome in its tendency than the decadent fruits of European civilization too often thrust upon us by these same intellectuals. In the end, we shall produce a great literature. There are signs of it already. We shall, in time, assert our native majesty.

Yet to show that the so-called jazz dialog is not exclusive with us, a young English girl, only 16 years old, has recently produced a book, which, as a projection of the younger set, is quite remarkable in its, so to speak, up-to-datedness. Mollie Panter-Downes, in "The Shoreless Sea," has not only caught the jazz talk in its perfection, but she instinctively grasps the importance of talk, subordinating, with positive genius, the essential descriptions in her book. This book is stark realism, family exposure with a vengeance, removed, however, from the rottenness so common in so-called smart fiction.

Now the point which I make in this article is, if our American writers of fiction will come to see that, in a novel, everything should be subordinate to the talk, the whole result of this understanding must invariably lift our novel writing to a much higher level than it is at present. Furthermore, the public is as much, if not more, interested in this result as are the writers. There is a very real and definite sense in which it may be said that the importance of literature in its bearing on our daily lives is greatly overestimated. But it is certainly true that good fiction, in its influence over the thought and manners of a people, is perhaps more important than any other branch of literature, for it is much more universally read. We need good stories, stories that conscientiously show us, through living characters, what we ourselves are. These characters not only furnish us with models of individual conduct, but they show us what to avoid. And it is through their talk that we know them. When our writers come more definitely to understand this fundamental fact, that it is what their characters say and how they say it that counts the most, we shall then be making a considerable advance toward that goal to which William James referred when he asked, pertinently, if it is possible to make a standard of literature.

All I have written does not mean that the value of talk in fiction has not been known—known, indeed, ever since fiction was first written. It does mean, however, that this value has not been properly understood; that, indeed, it has been largely overlooked, even by our ablest commentators. Nowhere in the works of the great majority of writers who have aimed to show how novels and stories have been, or should be, written, do I find any adequate treatment of this subject. If it has been so treated, and I have overlooked it, perhaps some kind reader will enlighten me. For example, Clayton Hamilton, in his very intelligent "Manual of the Art of Fiction," remarks that "In fiction, as in life, actions speak louder than words: and the most convincing way of delineating character indirectly is by exhibiting a person in the performance of a characteristic action." He then proceeds to give us an instance of characterization through action by reproducing a passage from the duel scene in Stevenson's "The Master of Ballantrae," which consists of nothing else but straight dialog, with scarcely any intervening words. (It is too long to quote, but I refer the reader to it as a striking example of my contention.)

So it is with all exciting parts. Talk tells the story. And the reason, of course, is so simple that it would seem absurd to state it, were it not for the fact that it is so generally ignored. It is that the novel is only an extension of the drama, and, as a pure work of art, is correspondingly weak in proportion as the writer leans upon the description, instead of on what the characters say. I hasten to observe that there can be no possible objection to description as such, for this is naturally a form of art in itself, but the difficulty usually occurs when it is overplayed, as a substitute for dialog, often because the author is, frankly, too lazy to work over his dialog so that it will reveal accurately what the characters are. This tendency to lean upon description is a form of "passing the buck," not uncommon among us. Indeed, we can pick up almost any recent American novel of any pretention, and by a little sympathetic insight witness the moral struggle going on behind the scenes in the mind of the author, in his effort to pry his characters loose from their descriptive setting, in order to make them stand up by themselves. Perhaps the most striking example among us is that of Thomas Beer, whose "Sandoval" has already been referred to—a young writer who has achieved a deservedly high reputation. He has the true artist's passion for perfection. He knows that he must make his characters talk. By this process, he succeeds in most instances. But he sometimes leans over so far as to leave too much to the reader to understand. This is not necessarily due to too slight a background of description as it is to the limitations of his dialog. If we wish to know how the thing can be done without any description at all, we have only to turn to Shakespeare. I defy anyone, confined, say, in a guest chamber at a week-end and without recourse to anything but Shakespeare, to read one of his plays without being interested in the story. The characters create themselves as they go along, saying precisely the things which make us see them as they are. Now all this seems very trite; yet we must remember that even Bernard Shaw, who declares that he is an improvement on Shakespeare, cannot write a play of his own without long prefaces and passages describing the characters. Mr. Shaw's genius is unquestioned, but economy of utterance is not among his most conspicuous virtues.

Themes for Novels

WE MUST also remember that, as time goes on and so many other influences act upon the reading public (movies, sports, motors, periodicals and newspapers, radios) to draw them away from books, the authors of these books yield more to a temptation to make it as easy as possible for the reader to get him to read at all. They say to the reader: "See the man. He has a sinister look. By this I establish the fact that he is a villain. Is the man about to murder some one? He is. Here comes a woman. She is—," and so forth.

A play must be concentrated and as a rule must deal with a single climax, which is also true of a short story. A novel, on the other hand, may deal with an epoch ("A Tale of Two Cities") or the life history of an individual ("Tom Jones"). When Dickens begins his great book with "It was the best of times, it was the

Dombey and Son Still Live in Shanghai

Enterprising Chinese Merchant Makes Good Use of Dickens' Famous Creation

By MRS. L. M. CRAMER

THE first time I saw the sign I pinched myself to see if I was dreaming. I was not. The sign read "Dombey and Son, Ltd."

Many a time in China one wonders if he is awake, and if awake, if perhaps his mind may not be wandering.

One of the most fashionable thoroughfares in Shanghai and, in fact, in the Far East, is Bubbling Well Road. In Bubbling Well Road shops one expects to pay a bit more for everything he buys than he would have to pay on any other street, even more than he would pay on Nanking Road. If he is a renter on that thoroughfare he pays many more taels rent each month than he would pay for a like house or apartment on Seymour Road or Joffre Avenue.

On Bubbling Well Road a few years ago a Chinaman elected to open a high-class grocery store. He bore a name that sounded to foreign ears something like "Domba." Now this Chinese had had a fairly good English education, and he had read Dickens. He knew the value of a name, and he was not slow to hit upon what seemed to him to be good joss. He had no son. The gods had not been kind, perhaps; but even Dickens' "Dombey" had not been blessed with a son, and because he could not put the sign "Dombey and Son" on his office door he went to the grave a sorrowing old man.

Mr. Domba saw possibilities in the name, for he hoped to cater to a foreign trade in his new store, and besides it might serve as a hint to the gods, this sign "and son," and eventually a man child might be born to him, who would worship at his grave after he had been gathered to his fathers.

And so it happens that in Shanghai, ten thousand miles from Dickens' land, Dickens' admirers see Mr. Dombey's ambition realized, except that Mr. Domba, having incorporated himself according to the laws of China, has added "Ltd." to his sign.

But the things that astonish the foreigner in China are not confined to the signs over grocery store doors. The *China Press*, one of the leading English-printed newspapers in Shanghai, recently carried the following:

"The fifth concubine of Marshal Chang Tso-lin is busy planning the establishment of a University for Women in Mukden. She will be the principal when the University is in working order."

And, where in the world except in China would you find a human being with finger nails three feet six inches long?

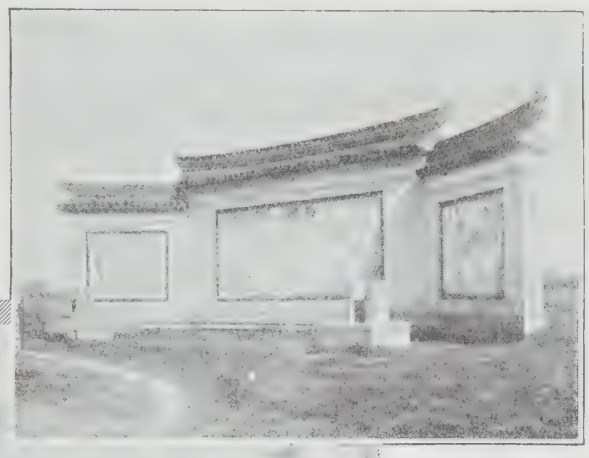
Up in Chowkiakow, in Honan Province, lives an old mandarin, a gentleman of leisure and considerable money. His name is Wong Lo, and he still clings to the old order of things in China when it was the mark of a gentleman to let his finger nails grow long, thus proving to the world that he never worked with his hands.

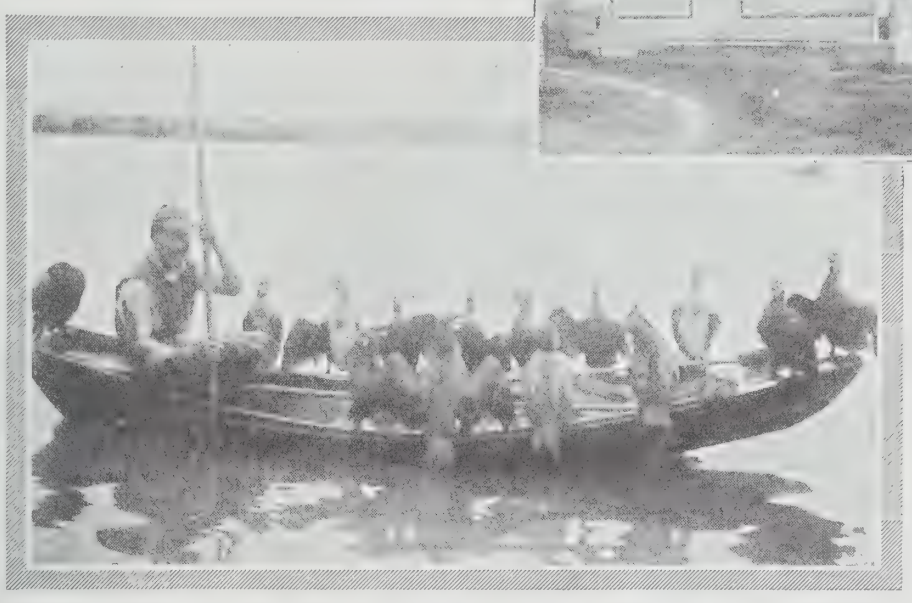
Wong Lo's favorite nail is three feet and a half in length. He has spent fifty of his seventy-three years in growing this nail, which adorns the little finger of his left hand, and on another finger on his right hand he has grown a nail a bit over two feet long. Other nails on his fingers are not over five or six inches long. His pet nails he keeps in bamboo sheaths for protection.

Wong Lo is naturally forced to limit his activities to his brain. The sleeves of his jacket are made detachable so that they can be the more readily slipped on and off. He cannot go out in a crowd for fear someone will jostle him and break off a foot or two of his favorite adornment. His eating is not the pleasure it would otherwise be, because his long nails interfere with the easy manipulation of his chopsticks. In sleeping he has to make special arrangements for his finger nails to rest, so that he will not turn over suddenly in the night and ruin his lifetime's attainment.

And when he dies they will have to make a special coffin so that his pride and joy won't be ruined when he reaches heaven.

China invented many things—printing, and gunpowder, and football. They didn't call it football; they called it Tz'uk Kuk, and it was invented by none other than Huang Ti, the "Yellow Emperor," who reigned more than 4,620 years ago. This is believed to be the oldest outdoor sport in the world. Incidentally, the emperor's favorite wife originated the silkworm industry in China.





Above—A spirit wall, protecting a temple from wild spirits. Below—Cormorant fisherman with his birds—Soochow.

In Wuhu, a Chinese city on the Yangtze, which is every bit as funny as its name implies, there are several little mud huts, straw thatched, in which there are more than the average of little children. This group of huts is just without the big south gate of the city. The girls are just the average little, dirty-faced girls in China, but the boys, even dirtier than the girls, if possible, are the ones to attract attention, for they wear gold rings in their noses.

I learned that the rings are not a matter of adornment alone, but to fool the evil spirit into thinking these little boys are little cows. No evil spirit likes little cows, and by masquerading these little boys with their nose rings to look like little cows, the evil spirit is going to be greatly fooled and pass them by.

What strikes the foreigner as being so queer is that the Chinese will have such fear for an evil spirit, when they know how very easy it is to fool one.

Practically everywhere one goes in China he will see little boys with silver rings around their necks. Sometimes the boys are almost grown to manhood before they remove them, and sometimes the rings grow most uncomfortably tight before they are removed.

When the boy is very young—a mere babe—a silver ring is put around his neck and locked there. Then, if the evil spirit is about, seeking whom he may devour or infect, or whatever it is that evil spirits do, he will find himself thwarted, because with this silver ring about the child's throat, the evil spirit could not enter his mouth and go down his throat to take up an abode in his heart. The ring would stop him, and once stopped it is an easy thing for the child to spit out that naughty spirit.

In Shanghai I noticed that when my ricksha coolie took me to the station to catch a train, he always took me in the most roundabout way, dodging down one narrow crooked street and then up another equally so, and yet when he came to the station to meet me on my return he took a much shorter way home, and through streets wider and less crooked.

Later on I found that he did this because he was solicitous for my safety on the train journey, and took me through these out-of-the-way streets, so that he might throw the evil spirits off my track, thus insuring me a safe and pleasant journey. Evil spirits travel only in straight lines. Thus if any man wants to escape one it would seem that about all he has to do is to travel a zigzag course.

To keep the evil spirits out, a joss house or temple is protected by a "spirit fence" placed so that it stands in front of the main entrance. Of course, as an evil spirit can go only in a straight line, it would never think of going around one end of the spirit wall, and thus gain access to the temple at will.

In Kalgan district there were terrible floods last summer, resulting in great loss of life and property. One day during the worst of the flood I said to my cook: "A-bou, the papers say there are terrible floods in Kalgan and all the country is under water, and people and livestock are being drowned. It is too bad we cannot get some of that rain down here to even up things a bit, for we are suffering for the want of rain, and many men die for need of it."

Then A-bou told me that owing to the drought earlier in the summer that had threatened to lay waste all the splendid crops of that section, many men had prayed to their gods every day for rain, but no rain came. At last one Chinese got so infuriated at his rain god that he fired a revolver at him, not only striking the thing of dried mud and straw, but setting it afire. This so infuriated the god that he let loose a thunderstorm which broke over the district almost immediately, and flooded it. The rain continued for some time despite prayers to the gods to check it. Lightning struck the man who fired his god.

There is a new Chinese butchery in Shanghai which has installed a very modern and up-to-date cold storage room. At the beginning of summer its owner caused a great many circulars to be printed and distributed throughout the residence section of the city. The circular said:

"It is now, the summer will be drew, the provisions of all kinds as fresh Beef, Pork, Mutton and Poultry are not necessary to put, so we make a Cold Storage Room. It is opened from 6-12 and 4-7 Closed; if it is not so please deposit or Order on our Stock."

All of which is very enlightening if one could but read the Chinese mind.

Foreign ladies living in Soochow have been very much interested recently in a circular sent out by a Hankow tailor soliciting their custom. It reads as follows:

"Ladies and Children Complete outfitter to dress in latest style, with various kinds of skin supplies etc, to Embroidery and hats make. Skilful handwork will restore responsibility for unsatisfaction. Being Reliable. The Patronage of Customers are Greatly Welcome with Best Wishes."

July is not the favorite month for brides in the United States. In China it would seem that it might be a month to be avoided. The *China Press* carried this news item one hot July day this summer: "A Chinese bride was suffocated in a covered sedan chair, as she was on her way to the home of her future husband, to be married there. In conformity with ancient custom

Chinese child.

A mandarin with a finger nail three feet six inches long.

Ancient Circuses and Modern Reviews

By PETER SCHUYLER

THAT the theater is nothing but another form of the pagan circus is something which the producers of musical shows demonstrate irrefutably every summer. In ancient days the advertising slogan was, "Bread and the Circus." The press agents of the Caesarean period without doubt bruited abroad the news that on a certain day a record number of Christians would be thrown to the lions. The result was a packed amphitheater. Today the pagans who control the Manhattan circuses do not hand out bread to the customers. It is true that at some of the vaudeville playhouses a queer, pinkish liquid, a sort of left-hand brother to the more virile-tinted red lemonade of the traveling outdoor circus, is passed around without charge to innocent, inexperienced victims.

* * *

Mr. Earl Carroll recently stole a few rumbles of thunder from his brother producers when he started a drive for recruits for "Vanities" by radio. From Station WHN, located on the roof of Marcus Loew's State Theater building, a call was broadcast for girls to fill up the chorus of the forthcoming show. The requirements announced were "pretty faces, good figures, and neat ankles." For fear some deception might be practiced on Mr. Carroll's anatomical judges the applicants were required to display their qualifications in bathing suits. When asked if there were not enough chorus girls walking the Great Shine Way looking for jobs without drafting more, Mr. Carroll was quoted as saying that he wanted "fresh ones" because in the chorus "they got old in a few weeks." In the same interview the producer made more specific the qualities he demanded in the new army. The specifications, in order of importance, were—"first, figure, second, face, and third, merit." Mr. Carroll, pressed for an explanation of his requirements, is reported to have explained that a face could be changed if it was not satisfactory, that merit did not count, but that a figure had to be naturally beautiful as it was impossible to alter that. Surely nothing could be more lucid than Mr. Carroll's elucidation. A snub nose might be straightened by the use of a little putty; it did not matter whether a girl was a moron as long as she could meet the other requirements, but her figure must be real because the amount of clothing she would wear would make deception of ticket buyers impossible.

A shout of protest went up over this misuse of the radio. An angry mother was quoted as being especially wrothy over the invasion of her home by an invitation to her daughters to put on their bathing suits and run down to the Earl Carroll Theater to get a job in the chorus of "Vanities" at $35 a week.

When sufficient publicity had been secured the broadcasting was stopped. Announcement was made that the American Radio Association was going to urge the next Congress to limit the liberties of the sending stations and set up what would amount to a radio censorship. Station WHN, located on the roof of Marcus Loew's State Theater building, was singled out as one of the chief offenders against the purity of the air. The managing editor of one radio publication, writing to Secretary Hoover to inquire if there was any law which could be invoked to clean up the atmosphere, asserted that his paper had been receiving complaints about the stuff sent out from WHN from the time the broadcasting station was purchased by Loew and moved to the theater roof from its original home on Long Island.

The management of WHN pleaded innocence in sending out the call for "Vanities." The use of the station had been given the producer as an act of kindness, it was asserted, and no one knew that the invitation was to be broadcast to the world of inexperienced girlhood. Mr. Carroll's press department was reduced to tears when it learned of the ungrateful action of the Angry Mothers. What was in reality an act of charity had been misconstrued by the evil-minded! The press agent's defense deserves to be included in Great American Addresses. In the interest of good literature, lofty idealism, perfect unselfishness, and unconscious humor it should not be permitted to be buried under the mounting heap of disinterested statements to the Manhattan newspapers.

"Most of the girls who have applied support their mothers," says this ought-to-be-immortal utterance. "As Broadway needs a fresh supply of chorus girls to take the place of those who have grown old, we feel it is a perfectly legitimate method of reaching inexperienced girls. It is a pity these girls have to be deprived of an opportunity to support their mothers just because a few Puritans object!"

* * *

Of all the elements in the amusement world the independent or "little theater" groups have the bitterest struggle for existence. Unless they happen to be subsidized by some rich, philanthropic souls who write plays (which no one will produce), or who wish to perform upon the platform (when no one will hire them), or who like to paint crazy scenery (which no one will let into an established playhouse), they are born to die an early death. The competition from the commercialized theater is fierce and unrelenting. The attitude of the ordinary ticket purchaser is one either of ribald contempt, cynical indifference, or brutal neglect. To the man in the street individuals who seek to uplift the stage, whose utterances, public and private, and whose productions afford some ground for the characterization, are "a lot of nuts." Most people go to the theater to be entertained, not to have the latest continental inventions in stage mechanics or lighting crammed down their necks in the name of art. They are not keen for psychological problems, puzzles in sex perversion, and all the other trash with which the independents almost always dabble.

Always the "independent" theater has an idol to be worshiped: Shaw or Schnitzler, Galsworthy or Dunsany, Kapek or Andreyev, O'Neill or Glaspell, Molnar or Kaiser. Bowing down to the idol is the main business of the "independent." Everything is done in the name of novelty and art although producing plays which no one goes to see is neither novel nor artistic.

Of all the "independent" groups in Manhattan the Equity Players started under the biggest handicap. It was sponsored, at least ostensibly, by the Equity association of legitimate actors. For that reason it carried the trade union stigma. It was under fire from the beginning on two sides; it was an independent theater and it was a union enterprise. Explicit denial was made that the union was in any way involved with the venture but it was later admitted that some thousands of dollars had been contributed by the union to keep the Equity Players going when the public refused to do anything toward that end. But it is not a union activity.

The record of the Equity Players is interesting because it shows the steadiest succession of artistic "failures" either the commercialized or the little theater has known. It started its career with Jane Cowl in "Malvaloca," which even Miss Cowl's popularity could only keep going for forty-eight performances. Then followed "Hospitality," forty-six performances; "Why Not," one hundred and twenty-three performances; "Anathema" (with Maurice Schwartz, director of the Jewish Art Theater, as guest star), twenty-three performances; "Roger Bloomer," described as "a vivid American play with a background of modern psychology" lasted fifty-six performances; "Sweet Nell of Old Drury" (a revival with Laurette Taylor in the principal rôle) fifty-one performances; "The Chastening," twenty-two performances; "The Rivals," another revival, twenty-two performances, and "Antigone," three special matinees. The season of 1923-24 included "Queen Victoria," James K. Hackett in "Macbeth," "The New Englander," and "Expressing Willie." This last is the first and only substantial success the Equity Players have enjoyed and just why Rachel Crothers' play should be the one to chase away the jinx is a mystery, unless the reason be that it slakes the universal desire to see a snob get his deserts, and gives Louise Closser Hale once more her sphere as a wasp-tongued old woman. Miss Hale is the most accurate and indefatigable sharpshooter among the female comedians. No laugh escapes her eagle eye. If the audience has any doubt that what Miss Hale says is funny she lets the secret out by laughing at the lines herself. There must be something in the thought-transference theory because the audiences at "Expressing Willie" certainly laugh at Miss Hale.

Dickens, Pickwick and Us—By W. TEIGNMOUTH SHORE

DICKENS was born on February 7, 1812. But both the New and the Old World are very much more than a century or so older than they were when he uttered his first whimper. In many ways, both mental and physical, we are separated from his early days by a deeper divide than that which stands between us and the times of Queen Bess. Early Victorian is almost as much a back number as is Early Elizabethan. We have moved quickly the last hundred years; are driving on quickly still. It's the difference between the coach and the auto.

It would be waste of your time and mine to speculate what Dickens would make of us and our ways; but it will not be uninteresting to glance at some of the changes which he assisted to bring about in the art of fiction.

It's a mighty big pity that Dickens wrote anything else than Pickwick, which was given to the world in 1836 as "The Posthumous Papers of the Pickwick Club, Containing a Faithful Record of the Perambulations, Perils, Travels, Adventures and Sporting Transactions of the Corresponding Members," with a green cover which gave promise that sport was to play the most prominent part in the said record, which it did not. It is a picaresque story of middle-class adventure. Pickwick is a long way the finest as well as the jolliest thing that Dickens did. It might have gone forever, more perambulations and perils; all that is typical of his genius that is exhibited in his other works could have been hung upon the Pickwick peg. Dickens was a humorist and good-humorist; beyond that practically negligible as a literary force; beyond that no more than one of his many contemporary purveyors of sentimental, melodramatic slipslop. I am leaving out of count his essays, very many of which are charming and worthy of more esteem than they receive; and "A Christmas Carol." Dickens could have gone on pouring out his heart Pickwickianly had he not unfortunately taken it into his head that he was born to be a writer of more or less serious novels and been encouraged in that undertaking by shortsighted critics and an undiscerning public.

How immense and amazing Pickwick is as it stands. What a tremendous flood of youthful high jinks; of animal exuberance; of glorious funniments; of admirable character creations! What inexhaustible hilarity! What exuberant prodigality of incident! With here and there, as always is the case in the performance of a supreme comedian, a touch of pathos, even of tragedy. The first few chapters move slowly and are labored; then he gets into his stride; then has his full fling; and we rush along with this go-as-you-please tale till we arrive breathless at the end.

Let's stretch the wings of our imaginations. Suppose Pickwick had gone on and on, month after month, year after year, what sport would have been the encounters and the achievements of Mr. Pickwick and Sam Weller with—to take but a few examples—Mr. Micawber, Dick Swiveller, The Marchioness, Captain Cuttle, Major Bagstock! And there are others we would have had them meet. But Sam, at any rate, would have had no truck with the maudlin Little Nell or Paul Dombey, or with the melodramatic Sidney Carton or Carker. They wither at one touch of nature. He and his master would have had, I hope, a soft spot for Little Dorrit and would have delighted in David's aunt. But Agnes, whom the said David married, I'm sure to his cost. Good Lord, we miserable sinner-men don't want to marry our guardian angels! That would not be bringing heaven to earth! Dora is far more to my taste, but she did not meet her due meed of admiration and appreciation from the somewhat top-lofty David after he had married her. I am positively certain Mr. Pickwick would have loved her dearly and have told me that I was not worthy of her. But then if we all got only what we deserved in the way of a wife, we should mostly be sad-like husbands. Yes; I should like to have a dozen or more volumes of Pickwick upon my shelves. They would contain the quintessence of Dickens.

Not so long ago I read right through Pickwick again and enjoyed myself hugely. Every now and then it was tiresome to find so much fun based upon the over-consumption of punch and other hilarious drinks, many of them even in this country mere matters of memory, or rather of history; quite all of them so with you! Once Pickwick & Company, with whom that delicious rascal Jingle, have driven out of the yard of The Golden Cross, at Charing Cross, on their road to Rochester and immortality—all is well. Tallyho! Tootle-tee-tootle the horn, Mr. Guard! Along we go on the only-too-short tour of riotous jolliments; not a bit tired or bored when we arrive at "The End" amid a clashing of wedding bells! Tired? On the contrary, very ready to go on along. But Dickens would not have it so; more's the pity, say I.

The setting, the scenery, the manners, customs, costumes, and so forth, of Pickwick belong to a dead past. When the social historian of London comes along to teach our children's children about our great-grandfathers and great-grandmothers and what London was in the early twenties and thereabouts, he will turn to Pickwick for authentic information. He will get it. It is a vivid picture of the life of those dim days. Compared with now, London then was a small place and the country was nearby; it was dirty and dingy; ill-lit and ill-paved; the means of communication scanty; its manners for the most part rude and boisterous and often cruel. And—but turn to your Pickwick; you'll find all about it, though here and there will be felt the want of an explanatory footnote or illustration. It will soon be a vanished city; already vastly changed. Dickens and Pickwick would find it easy to lose themselves in it now; many slums and other ill-savored quarters have been swept away; but the diligent and zealous seeker can still find many a spot redolent of Pickwick.

It is a usual accusation against Dickens that he was a caricaturist. Not much of it, anyway. Anyone who knows London highways and byways intimately and who also has a full knowledge of the London of a hundred years ago will meet many a quaint and curious figure. It needs only the observant eye to see them; but the fact is that never has there been another writer, except Shakespeare, who could put them on paper in such complete, lifelike fashion. The misfortune really is that Dickens had in his composition much of the actor; in his other works he could not steer clear of melodrama and theatrical claptrap. Yet, strangely, his stories do not make good on the stage; his plots, such as they are, are not adapted for the theater. One of the charms of Pickwick is that it is plotless, amiably rambling. That is why Dickens was his best self in it.

Is their any kinship between the fiction of Dickens and that of today? Surely. Though not at first sight apparent. Dickens lifted story-telling out of the rut of dealing only, or almost only, with the middle and upper classes; he looked for characters and took them everywhere he could find them. He was not a maker of plots; most of his best writing stays the progress of his tales, just as much of Shakespeare's greatest poetry does the same with his plays. His stories centered round his characters, round his people. Is not much of this true of the finest fiction of today? The well-fashioned plot is fought shy of by those in our and in your country who are doing the best fiction work. The portrayal and development of character is the chief concern. But one striking difference there is between then and now; then stories ended with happy marriage bells; now they often only begin with them.

Dickens was a good-humorist; hated what in life he found was not good-humored, and when he tried to depict it was always out of tune and flat. Today there is a lack of good-humor among our cleverest writers of fiction; so there is among yours.

What of the morrow? I don't know; do you? But I hope this: that there will come a writer endowed with a large portion of good-humor and gifted with *unconscious* powers of insight and analysis. We want life whole. Dickens did not, could not, give it so. I know one only writer of English fiction who has done it; Fielding. It is another Fielding we need; shall we get him? A human, sympathetic, understanding man.

But let us not forget to be thankful to Charles Dickens for Pickwick. Let us read and laugh. The greatest gift of the gods is laughter.

Mr. Ford's Page

THE election simply means that the men who can do things are going to be given the chance to do them. The people are through electing honest men merely because they are honest, and earnest men merely because they are earnest, and so-called "progressives" merely because they have adopted that name. Honesty does not always imply ability; earnestness does not imply knowledge; "progressive" labels do not imply true vision. The people are through voting for piecemeal qualities; they want working units.

Anyone who would draw partisan boasts from the people's action on November Fourth—and of course all politicians naturally do this—would simply be illustrating once more the blindness of those who cannot see the inner sources of our national convictions. In a way, all the parties were beaten. The Republican party was beaten before the election and would have been beaten there had not fundamental changes occurred, and the other parties were beaten at the election.

For, if there is anything clear about the people's action it is this: it was not a party movement in any sense. It was approval of a type of mind and a quality of action which had inspired national confidence. One has only to line up, in imagination, the Old Guard of any of the parties, to see how impossible any party victory was.

There is not a political organization in the country that the people would vote into power. If they had thought they were voting the Republican organization into power, they would have withheld their hand. They voted for a President in whom they had sufficient confidence to give him four years to see what he could do in curbing political interference with the proper functions of government.

It is simple truth to say that winning the election this year is a mighty serious matter. The cry of the revolutionary element that the election is a throwback to reactionism is just as false as the cry of the politicians that the election is a vindication of things as they are.

There is no need to deal harshly and in a spirit of hate with the extreme radical view. Many inexperienced people hold it because they have nothing better. They desire an enrichment of life, and shrewd or ignorant leaders have exploited that desire. The desire itself is normal and right. But they need to learn that Progress is not the possession of any party—not even the most "liberal" party. Progress is not political, though political principles may be a a part of Progress. Progress is the growing life of the people. Political parties do not create it and they cannot hinder it except in their own, the political, sphere.

We have, for example, the spectacle of the nation having progressed without hindrance in every sphere. The march of invention does not stop to ask whether Republican or Democrat is in power. Science, religion, philosophy, are perfectly indifferent to parties as long as freedom is not curtailed. Has politics kept up with these other columns of progress? Certainly not. Partisan technique has. Party organization has. But these things are husks. They are dead skins which growing life sloughs off. So that, suddenly, the most perfectly organized party finds itself drying up for lack of vital sap; it has been cut off from the people because in real politics it has made no progress.

Only incidentally can political parties keep step with progress and that is in seeing that the service to be rendered from the political sphere is as good in quality as that rendered from other spheres.

The radicals ought to be informed that no party can "make" Progress. The "regulars" ought to be informed that the last election was not a sign that the people are satisfied with the degree of Progress made. And all parties ought to be informed that the highest service that politics can perform is clearing the way for Progress that is coming.

A statesman is a man who clears the way for Almighty God. Politicians who obstruct that way are swept aside with the rest of the rubbish.

Now, that just about states the task which confronts any man whose fate it has been to win an election this year. It is Stanley Baldwin's task. It is Calvin Coolidge's task. First, to bring their own service specialty—the political instrument—up to the level of efficiency attained by other instruments of human service; and above all to *clear the way for Progress.*

Certainly no man or party has any mandate from the people to maintain things as they were or are. And to secure the reforms and improvements necessary will mean meeting great obstacles.

One obstacle will be prosperity. There is no doubt that business will reach another peak. But that is not enough. The danger of any period of great prosperity succeeding an election is that it leads people to think, "this is what we wanted, and we are getting it." It also influences leaders to think that the old system is good enough. Prosperity acts as an opiate on political initiative. We have confidence that Mr. Coolidge will not think his job is over simply because prosperity comes to the country. No period of prosperity can compensate for the moral and material damage done by a period of depression and adversity, because depression always hits the body of the people, who should never be injured in the simplest needs and rights of life.

Mr. Coolidge can be trusted to be aware that the time is past when even prosperity can be attributed to any party—the country has grown too big for any interest or group to bring on "hard times" or "good times" at will; although, it is admitted, that confidence in the Executive is a big influence in releasing the prosperity-making energies. But all prosperity of the present era is uncertain of continuance. It is not standardized; like the weather, it may be foretold, but not controlled. And yet, being economic, it could be controlled for the advantage of all. And in that control the political factor, when it grows big enough, will have a part.

Another obstacle to be met is *old methods.* Just because the government does a thing is no proof that it is best. All methods of government should be scrutinized to see if they in any way hinder the natural flow of progress or make prosperity spasmodic. Because the Government has handed its money functions over to private corporations, does not prove it to be right. Because the Federal Reserve System has gradually retired the United States Government and become a new money power in its own right, does not prove the propriety or national advantage of it. Methods must be scrutinized with care and overhauled where necessary.

This work of reconstruction is best undertaken in a time of prosperity. Patchwork improvements, under the stress of depression, do not serve. Politicians always try to "do something" when the time for doing it is past. You cannot prevent a system from breaking down after it has broken down. You must use your preventive wisdom before the break comes. Prosperity is the period in which to prevent adversity.

There are four years to show what honest intelligence and unfettered courage can do toward these substantial ends. That is all the election means. And the great majority was heart's hope that the four years be made to tell impressively in the increase of the plain people's liberties.

ALL parties were beaten, one of them before, the others at the election. What won was the people's confidence in the type of mind and quality of action which are found in the man elected President. He is given four years to see if he can do what parties have promised and failed to do. He cannot command Progress, but he can clear the way. Progress is not political, but there is sore need of politics becoming progressive. Only up to a certain point is Prosperity political. Confidence in the Executive releases prosperity-making energies, but does not create them. Prosperity has always been the politician's excuse for neglecting the main job. The people trust that it will not be so with Mr. Coolidge. A system so organized that prosperity is the exception and not the rule needs overhauling. It is that task which makes winning an election in 1924 so serious a matter.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Essence of the Elections

THE election is over, with results that were foreseen by anyone who observed the country instead of the candidates. The country began to say in the primaries of last spring that Calvin Coolidge was the national choice for the Presidency. In spite of campaign exigencies and opposition, that sentiment received no check or setback; it grew steadily into the tremendous majority of November 4.

Perhaps there were never three more incompetently managed presidential campaigns in the memory of living voters. Davis, of course, was finished in the convention that nominated him. La Follette started with a certain amount of strength, but dropped part of it at every public appearance until none was left. Coolidge attacked no one, misrepresented no one, spoke only American common sense, and swept the country.

Of course, to certain inflamed minds the election indicates that the American people are incorrigibly reactionary and have once more placed their necks in the capitalistic halter. That is, generally, the view of La Follette supporters. To others it indicates that a mammoth "slush fund" bought and bribed the American people. How unintelligent these charges sound now, and how magnificently the American people have justified their own sound discernment between men and issues. It is a loss in public education that we do not have a post-election period in which the nation might study all campaign utterances and consider them calmly in the light of events. It would render the people wiser against the next election, and the candidates more respectful of the popular intelligence.

Taken in connection with the election results in Great Britain, the indication is that the Anglo-Saxon peoples have returned to a firm basis of common sense. The extremist shouters have been discarded in favor of the quiet doers. Panderers to an unintelligent discontent, inciters to enmity against the institutions which preserve to us such justice and economic opportunity as we possess, vociferous promissors of a New Era to be had through the influx of inexperienced revolutionaries into the seats of government—these have been judged, tagged and set aside by the two ruling nations of the earth. There has been no question of the motives of the promissors, but the elections answer that there *was* question of their ability to perform. And this is not snap judgment on the part of the people. Ramsay MacDonald was given his chance—he has been before his people all his life. La Follette has been before his people and in public service for forty years. They were not rejected in public ignorance nor through public impulse: they were thoroughly known: the people measured them, and found that they came short. The most significant event since the war is the refusal of these two great peoples to follow the revolutionary will-o-the-wisp any farther.

But all this means but a return, a clearing away of new obstructions, not necessarily a step forward. The elections are not an achievement so much as they are a place of beginning, an opportunity to achieve. The next four, eight or twelve years are to be more crucial in the world's history than the ten years that have passed since 1914. Winning an election is the assumption of responsibility from which any man might shrink. Partisans may glory in their "victory" or gloom in their "defeat." To those who see the problems ahead there are no such terms as victory or defeat in the campaign sense, there is no such thing as the prestige of office—there is work that will require all of human wisdom there is, and all of divine illumination that may be vouchsafed. The spirit of party must die as the Spirit of Humanity now advances to its epochal trial.

The March of Modernity

TRULY the old order of things is changing in Europe. It is not alone princes and principalities that are being scrapped, but cherished institutions of quite a different description. Now it is Venetian gondolas and the famed hospice of the Great St. Bernard.

"A traveler, by the faithful hound, half-buried in the snow was found," says the poet. The "faithful hound" still remains, but things are undergoing a drastic change for the traveler. The famous hospice in the Alps is to be turned into a modern hotel.

The increased use of the automobile and the consequent greater volume of travelers has proved too much for the good monks, and the voluntary contribution box was too often overlooked or niggardly recognized by those who had partaken of the monks' hospitality. So that alongside the hospice will be erected a modern lodging where guests will register and pay their shot as in any other hotel.

The same wave of modernity has overtaken that other happy hunting ground of tourists, Venice the peerless, and the gondola is doomed. An edict has been issued that all steamboats and all gondolas in Venice must be equipped with electric engines.

Let Ruskin not arise from his grave and smite Mussolini Caesar! No more will the gondolier warble weird melodies to the rhythmic beat of his oar, no more will the picturesque craft glide along the placid bosom of the sparkling lagoon. Electric launches on the Grand Canal! Automobiles and hotel clerks on the highest altitudes of the Alps! And more than that—a scenic railway projected for Mt. Sinai! The world is moving.

Very Fair and American—to Be Sure

THE *Christian Century*, an alleged religious weekly of no particular connections, whose mission seems to be the handling of those idea-seeking and thought-shirking clergymen whom the *Nation* and the *New Republic* shock too much, voices this patriotic sentiment:

> "No man who values freedom of opinion and speech has any business in an army officer's uniform, just as no Christian minister whose first allegiance is to Jesus Christ has any business in an army officer's uniform. An army, whether in time of peace or in time of war, is just the sort of thing that can exist only by the partial unmanning of the manhood of those who participate in it."

There seems to be a great deal of freedom of opinion and speech in that paragraph, which the records of our nation show was won and is protected by men in uniform. Why this bitter anti-Americanism of lily fingered, but rough speaking, clerics? Are they bent on succeeding the "parlor anarchist" with a pulpit anarchist?

In any case, it is instructive to watch the steady alienizing of a section of the American pulpit, and the adroitness with which the church's base is moved about in agreement with the exigencies of alien propaganda.

D'Annunzio the Jester

IF GABRIEL D'ANNUNZIO were to forego the spotlight pleasures which he so much enjoys he would fade away much quicker than the leaves on Vallombrosa. His latest stunt would do credit to a movie star. He has withdrawn himself (he does not say for how long) from "worldly affairs." "Every evening," he says, "I burn before an altar of stone the heap of the day's unopened and unanswered letters." It is quite evident that Gabriel is at present expecting no checks.

This method of treating one's diurnal mail will doubtless commend itself to those unfortunates who are continually but vainly endeavoring to dodge the tailor and the tax collector, and to ignore their importunate missives.

D'Annunzio has hitherto been regarded as a patriot, a poet, a perfervid producer of international sensations. He can now lay claim to being something more. He is a humorist.

Senator Lodge

"I THINK I may say that I have done a good deal of difficult and responsible public work," said Henry Cabot Lodge in his last campaign, and it is true. Born a man of leisure, he had done a tremendous amount of work in several fields. But how much he accomplished by it, and whether any of it will long survive him, are other questions. Clearly the most impressive work he did was the prevention of the United States Government entering the League of Nations. That this was Senator Lodge's work more than that of any other man, President Wilson recognized. And whether Senator Lodge's motives in that work were mixed, has been another question. Certainly there was far too much personal feeling in the matter, from whatever angle it may be viewed. Still, taking the long view of the thing itself, history may record that act as Senator Lodge's highest statesmanship. Certainly, at the time, it was in concord with the state of the public mind. Otherwise Senator Lodge's work might not have found a so successful issue. In any event, it is easily the biggest political feat the Massachusetts Senator ever achieved.

The later years of his life saw him classed with the political reactionaries. Yet he was not reactionary; he only maintained the *status quo*. Once his stand might have passed for "progressive," but political progress passed him. He stood still; progress moved on and left him behind. Not that his principles were wrong; he was thoroughly American; but there were other principles of which he did not seem to be aware. There remains behind him no memory of vicious legislation which he fostered, no aspersion on his personal character, no falsity to his trust as he saw it. He belonged to a type of life which has passed from the stage; his points of view were necessarily from that type.

The Vogue of Windshield Art

POLICE authorities in certain cities of the United States and Canada are ordering removal of all ornaments, such as bathing girls, red devils, and the other trivial decorations from the windshields of automobiles. Undoubtedly any obstruction of an auto driver's view constitutes an element of danger.

Another side of the matter illustrates the sheep nature of certain classes of people. A recent American visitor to Europe, who left before the windshield cult manifested itself, was surprised on his return to see hundreds of thousands of automobiles bearing girls or devils plastered against the glass. He inquired what had occurred during his absence; what new fete was being advertised, or what great feat celebrated. Blank faces met his inquiry everywhere. He doesn't know yet why motor America suddenly broke out in red blotches of bathing girls and devils. Neither does anyone else. But it offers an opportunity for study. Somewhere one who is a conscious or unconscious master of mob psychology is applying his knowledge to business. It would be worth a story, this capture of the public minds at intervals. The method of it should be made known to the public whose co-operation is so essential to its success.

Public Opinion

THE man who tries to please everybody generally pleases nobody. Long before the Christian era Esop illustrates this in his story of the old man who tried to conform to public opinion in the treatment of his donkey—all that he had—and not only miserably failed but lost his donkey into the bargain.

In the course of a speech recently made in Perth, the "fair city" which Sir Walter Scott has rendered famous in one of his romances, Lord Dewar made some pointed observations on public opinion as it is today. He said that as one walked along life's highway one would find that public opinion was "paradoxical at every turn from the cradle to the grave." For example, if a man did not succeed in his calling he was pronounced a failure. If he made money he was called a profiteer. If he went to church on Sunday he was a hypocrite; if he staid away he was a sinner. If he gave to some public object it was an advertisement; if he didn't he was stingy.

The *vagaries* of public opinion have played too great a part in shaping the destinies of nations as well as individuals; thus occasions have arisen when dictators were found the only means of disentangling nations from the muddling of "many men of many minds." If individuals were to follow the conglomerate advice so freely handed to them by their friends confusion and disaster would be inevitable. A man should be guided up to a certain point by the experience of others—this is only common sense—but his ultimate course must be shaped by his own reason.

"Red" Grange—Newest Pigskin Furore

Grange, a halfback on the University of Illinois football team, was the most discussed football player of 1923 and he is even a greater star this season. For two years he has been the outstanding player in a sport that closely rivals baseball for popularity. On three occasions this year more than 70,000 persons have crowded the great stadium in the village of Urbana, Illinois, coming from all parts of the Middle West to see this football marvel perform.

Football Player Receives More Publicity Than Presidents or Actresses

By PAUL MACDONALD

Why do more than 70,000 persons fight to get into a stadium just to see a boy, who delivers ice in the summer months and goes to school during the other months, run with a football? Why do more than 70,000 stand and cheer themselves hoarse about it? And why is this boy now generally regarded as the greatest broken field runner of all time and by many laymen as the greatest player of all time? Why was he discussed more in the last two months than the presidential candidates?

MORE than 70,000 persons jammed into a double-decked stadium on a Saturday afternoon. Thousands more, outside, unable to get in because of "limited" seating capacity. As the hour of two in the afternoon approaches there is hardly an empty seat visible to the eye; at two there will be none vacant. Just before two the gates at one end of the stadium swing open and thirty-three men in football uniform rush onto the gridiron while most of the 70,000 cheer. But while the cheering is going on every one of that vast throng is searching for one player, a tall, lithe chap on the back of whose jersey is the figure "77" in bold deep orange. The wearer of this number is soon discovered and for two hours he holds the attention of all present.

If, perchance, you know nothing about football and happen to hear someone say, "There he is—the one with the '77' on his back," you will turn to your program to identify "77." And you will discover that the wearer of this number is Harold Grange, a halfback on the Illinois football eleven.

For two years Grange has been the lion of football, the idol of the game's enthusiasts. In those two years he has established himself as the greatest individual player of a football age and the most powerful scoring weapon any team has been able to place upon the field. He is the greatest individual drawing card the game has known; he has, by his own talent, brought more people to football games than any single player that ever lived.

Grange is all the more remarkable because he developed at a time when football leaders had concluded that the day of individualism in football had passed. There would, of course, always be players that stood above their fellows, but, they argued, there could not be another one that would stand out alone. Team play has been finely developed in recent years and modern football exacts more team play than the game used to demand. As team play advanced it lessened the chance of the individual to become distinctly separated from his mates. Team play makes for uniform excellence and not individual superiority. But Grange became the outstanding figure of his sport regardless of the present conditions. He became the superman of football.

In two years Grange has received more publicity than any three football players combined. In the heat of a presidential campaign Grange was being given as much newspaper space as the candidates for the Presidency. Many times as many people read about his individual performances as read through the campaign speeches. His pictures were printed more times than those of Calvin Coolidge or those of either of his opponents in the campaign. He is discussed more than any team in the land.

And, who is Grange and why all this fussing and fuming about him?

Grange is a well-built youth who is playing his second year of collegiate football for the University of Illinois. He is red-headed and he has large feet and big hands, strong legs and broad shoulders. His home is in Wheaton, Illinois, and he drives an ice wagon during the summer months in his home town. His father is a deputy sheriff and he has a younger brother, Garland, also a halfback, who is now a freshman at Illinois. He will make his debut on the Illini varsity next autumn when his brother plays his final season of major football.

If you are a follower of football you will be able to name at least six good halfbacks of recent years, men like Gipp, Mahan, Casey, Pfann, Killinger, Martineau, Kipke, among others. You may even argue that some of them were better backs than Grange. But there is one thing that stands beyond dispute and the one thing concerns the drawing power of this young man. No player in the history of the king pastime for college men ever succeeded so highly as a magnet. While there may have been better players there is no one that ever appealed so highly to the public.

Grange is like Ruth. Analyze them and you find the same principle ruling their popularity. Ty Cobb was a great drawing card in baseball but he was never so great as "The Babe." And Cobb was infinitely a better ball player. The reason is plain. Most of Cobb's best performances were inside baseball; they delighted the men that knew the technique of baseball; only they could fully appreciate Cobb's work. Cobb was the players' player. They could, better than any amateur or layman, fully understand the finesse of his work. The things in Cobb that brought forth their admiration nearly all escaped the audience. Ruth is nothing of that kind. Ruth has the punch. He can hit a ball harder than any man who ever tried to hit a ball. No one who goes to a ball park will fail to appreciate and fully realize the gifts of Ruth. They are within the comprehension of all who watch baseball while Cobb was beyond them; they could understand and appreciate but a small percentage of Cobb's accomplishments.

In football much of the splendid play is above the heads of the spectators. The average man who follows football does not know enough about position play, strategy of attack and defense and the finer points of the general play fully to appreciate the keen work of a clever quarterback, for instance. He does not know enough about tackle play, center play, guard and end play to appreciate the work of a skilled performer at one of these positions. There have probably been several players who were better linemen and ends than Grange is a back but their work escaped the general football public. The greatest center, guard or tackle that football ever produced would have no appeal to the stands; only those with an expert knowledge of play would appreciate his talents.

The backs in football appeal to the public. It is the back who carries the ball. It is generally the back who throws it and a back who receives it. Anyone can receive a forward pass, providing he is at end when the ball is passed or in the backfield, but it is generally a back who streaks down the field and receives the pass. The work of the backs is done out in the open, mostly. The public can follow them and the result is that nearly all the heroes of football played behind the line.

Grange has the advantage of position; he is a halfback. Grange carries the ball. More than that, Grange's best work is done in a broken field, where he glides by tacklers. When Grange makes one of his long runs he is visible to everyone in the stadium. He is carrying the ball. One after another the defense men leap for him. Sometimes they catch him; more often they do not.

People come from afar to see Grange play. They want to see him run. They want to see tacklers miss him. They want to see him elude the swiftest backs that can be held back to stop him. They like Grange because Grange is visible, understandable, sensational. One does not have to master a mass of technique before the talent of Grange becomes apparent; it is self-evident. Whether or not you know a thing about football it is a thrilling sight to see this man Grange speed over the flat green top of the gridiron and make tacklers miss him. Anyone can watch a man run and elude half a dozen men who are trying to catch him. It is cleverness that all can appreciate even if only a comparative few understand the technique of the runner.

To say that Grange is the best football player of all time is going a bit too far. His own coach, his team mates and his most enthusiastic followers who have a good knowledge of the game would not claim that for him. Grange, for instance, does not block or tackle. He has no defensive value. A good back must be as capable on defense as he is on attack. He must be able to block and tackle and put his ability to use. But, it can be said for Grange that he is the greatest broken field runner of all time. His record should convince any skeptic.

Then, what makes Grange such a superman in his opponents' territory?

In the first place Grange has the physical gifts. He has the build and the natural speed. He has large feet and big strong hands. Large feet, while frowned upon in drawing rooms, are considered an especial gift of nature on a football field. So are big and strong hands and thick and strong legs. Grange has these. He also has good shoulders and football coaches like to see good shoulders. There have been few football players above the mediocre who had narrow shoulders.

(C) Fotograms, New York.

HAROLD GRANGE.

Grange is probably the most complete runner of all time. By that we mean he has every quality that a runner should have. He has speed, agility, quickness, power, change of pace, reverse, pivot, and a deadening straight arm. He carries his knees high, swings his hips wide when in the proximity of a tackler. His steps are rather long and he seems to float over the ground rather than run. He does not carry the ball in the orthodox style, against his chest, but grasps the end in the hollow of his hand and pins it against his forearm. This gives him two free arms and he uses the one carrying the ball to balance himself in twisting, turning and reversing.

His long runs have nearly all started around end. He generally goes around his own right end and he goes unusually wide. On these end runs he starts from a deep formation. No attempt is made at deception. Grange goes deep, behind his center, and his interference forms to his right. When he starts there is a three-man interference ahead of him. The ball is passed and the opposing linemen charge. The Illinois line permits the opposing forwards to come through, slightly checking them as they pass. By the time the linemen come pouring through the Illinois forward wall Grange is on his way and there is not a lineman in the country who can catch him from behind. In the meantime, Grange's interference has blocked off the opposing end and tackle and the Illinois linemen are scattering in the defense territory as Grange circles the end. His linemen, serving as cut-off men, are blocking off the opposing secondary defense. On circling the end Grange reverses his field and begins darting through the openings.

This is how Grange ran against Michigan and all his long runs were made in this manner. The Michigan game is referred to because it was the greatest performance of Grange's brilliant career. In 1923 Illinois and Michigan were tied for the "Big Ten" championship. Neither was tied nor beaten during the 1923 season and when, last December, the two universities agreed to play in 1924, the game immediately became the most important on the Western Conference football schedule. Michigan coaches had studied Grange's play in 1923 and it was generally agreed that if any team would be able to stop Grange that team was Michigan.

The opening kick-off of the Illinois-Michigan game was a low, driving boot that went directly into the hands of Grange. He caught the ball on his own 12-yard line while on a dead run and he continued running until he crossed the Michigan goal line. In the first 10 minutes of this game Grange handled the ball six times. Four of these times he scored touchdowns and he gained a total of 256 yards. That stands as the greatest achievement in major football. Nothing like it is found in the record books.

In 1923 Grange won every important game that Illinois played by his individual runs. The skeptics were waiting for Michigan to test Grange. Against Michigan he did what no other player has been able to do against any opponent and that performance stamps Grange as the super-runner of all time; at least it gives the convincing proof to the statement that he is. He played only part of this game but scored five touchdowns and threw the forward pass that gave Illinois a sixth touchdown.

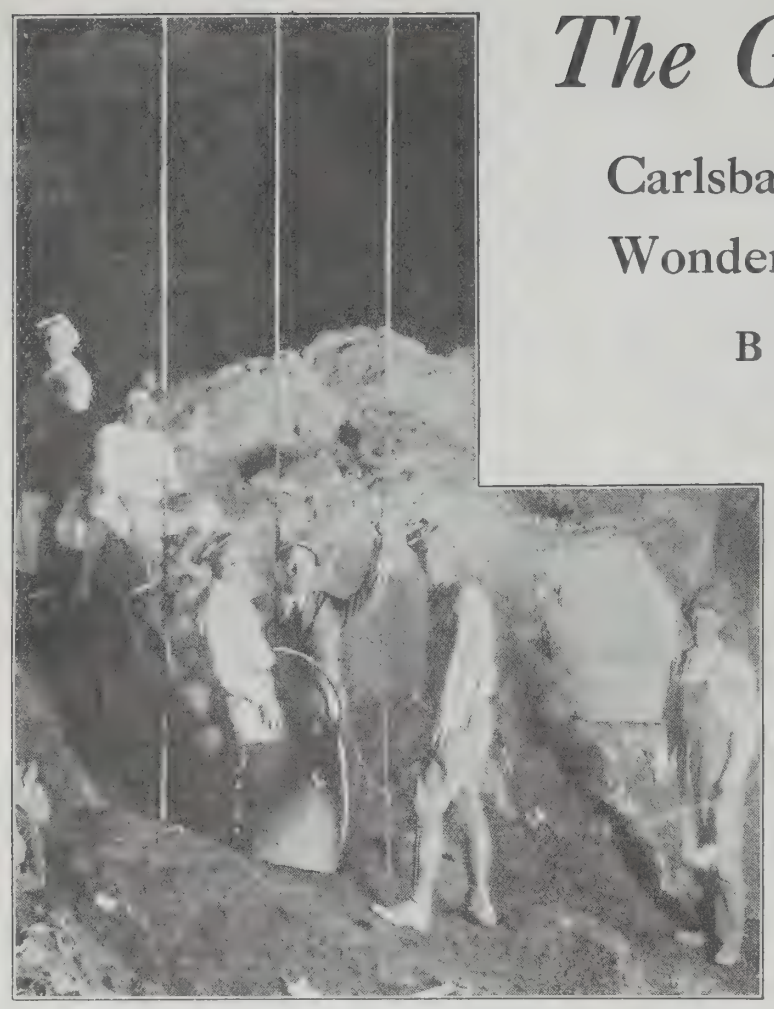
Some who try to discredit Grange say that his success is due mostly to the line in front of him and the interference that he gets. Take the Michigan game as an example: After Grange left the lineup and sat on the sidelines, Illinois tried the same plays that Grange had used with other backs carrying the ball. Michigan stopped these plays each time and several of the attempts resulted in loss of ground. The failure of the plays with Grange out of them would indicate the part that Grange plays in their success.

This Illinois line that is given credit for the success of Grange happens to be the weakest part of the Illinois eleven. The strength of the team is behind the line. Illinois is a poor team with Grange out of the lineup; a great team with Grange in the backfield. During the time that he was on the sidelines Michigan had no trouble with the Illinois line; Michigan outplayed Illinois.

Grange, against Iowa, proved that he can cut in as well as go wide on his runs. He cut in repeatedly against Iowa. He went off tackle and he was supposed to be weak in those thrusts.

As a forward passer he is one of the best in the game. He could not throw a ball last season but in the spring Coach Robert Zuppke had Grange practice pitching overhand. He developed a good overhand motion and in the autumn he used this to throw a football. He discovered that he could. His passing is of great value to the Illinois attack, for Grange, after starting several runs from a deep position, finds himself able to bluff the run and throw the ball instead. Since the opposing team is dead anxious by this time to reach Grange and smother him before he gets well started, Illinois is able

(Concluded on page 15)



The beginning of the Carlsbad Cavern.

The Grandest Cave in America

Carlsbad Cavern an Aladdin's Palace of Beauty; Wonder of the World in Guadalupe Mountains

By MAX BENTLEY

AT THE top of a low ridge on the extreme southeastern break-off of the Guadalupe Mountains of New Mexico sits a cluster of small buildings, and among them a derrick, a hoisting engine, and a steel bucket hanging over a shaft. At 180 feet straight below them begins a cavernous void reaching downward along the edge of the mountains, northeast to southwest, that is now known to be one of the earth's natural wonders.

The elevation is 500 feet above the nearly level plain stretching away southward. The plain is hard to the sight but brilliantly visible to the very point where the eye fails. It is sparsely grown to thorny cacti—ocotillo, sotols and lechuguilla are the predominating species—but relieved by a hard green coloring of catclaw, sage and greasewood shrubs. Off to the west Guadalupe Peak rises sheerly from the plain, a stupendous pile of rock 8,500 feet above the sea, and behind it, ascending swanlike a thousand feet higher, the conical dome of Signal Peak, highest point in the range. Though thirty-five miles distant it is silhouetted clear and sharp in the attenuated desert air.

I know of no spot in America standing out so boldly for all men to see, and yet seen by fewer men, as this abrupt southern ending of the Rocky Mountains and the wonders it holds. Until the past summer not a hundred persons had been where Jim White took me—and Carlsbad, New Mexico, only thirty miles away. I know there is no spot more worthy to be seen than the cavernous limestone perforations in the Guadalupes, beginning at the foot of the shaft I have mentioned. The hoisting bucket drops the visitor 180 feet into a chamber one mile long, and this chamber is the beginning of Carlsbad Cavern. The cluster of buildings, weather-beaten now from long disuse, was used by crews of laborers lifting guano, rarest of fertilizers, for shipment to the orange groves of California.

"Occasionally," said Dr. Willis T. Lee, in the *National Geographic Magazine*, "a matter-of-fact statement of a geographic discovery sounds incredible." And because it happened to be Jim White, a cowboy and not a scientist or writer, who discovered the Cavern, its marvels lay unrevealed while Yellowstone and Niagara drew the crowd. Reporting his findings in the most matter-of-fact way, Jim White was met with incredulity for twenty-two years—until, last autumn, he interested Dr. Lee who interested the National Geographic Society and the National Parks Service, which together appropriated $21,000 for scientific exploration by Lee himself.

Lee was a reclamation engineer working along the Pecos River when Jim White went to him to report that the inside of the Guadalupes was hollow. Nine months of exploration by Lee, White, and a party of surveyors has revealed not one cavern, but a series of caverns whose dimensions even now cannot be estimated, since various winding passageways have been explored only for fifteen miles, in a general southerly direction. The discovery was of such startling magnificence that in October of 1923 President Coolidge set aside the region as the Carlsbad National Monument, and the government withdrew from public sale 80,000 acres on the mountain top lying above the explored portions. Luckily for posterity the government owns nearly all of the Guadalupe country in New Mexico.

THE DEARBORN INDEPENDENT sent me to New Mexico to see the Cavern. At Pecos, Texas, on the Bankhead Highway, I was joined by Judge J. C. Hunter, of Van Horn, Texas. Late in the afternoon we turned our car northward and traveled ninety miles across the arid plain, over a rough but quite negotiable road, to the town of Carlsbad. Tourists will take note that the Cavern can be reached either from Pecos or Van Horn, northward, or from Carlsbad westward. Two days will suffice for the round trip. Unusually good accommodations can be had at Carlsbad.

Next morning, with Jim White and a party of Colorado oil men, we made the thirty-mile run in two hours flat to the abandoned headquarters of the fertilizer company, and by 10 o'clock were standing by the bucket. The last pull was the hardest of all. The road degenerates into a 27 per cent rocky grade as it leaves the plain very suddenly to crawl around and up a steep hill two miles from the bucket. Thereafter the way is rough but level.

Hunter and I gazed timorously down the shaft and stealthily tested the steel cable which lowers the bucket, while Jim fussed at the engine. Jim said, "Don't get skeered if she lets go all of a sudden. Just hang on and hold your insides in. I figure I can stop her." We climbed aboard in twos—it was a tight fit for Hunter and me, thank heaven!—and were shot upward four feet as the trapdoors lifted outward, then plumped straight downward—down, down, down. It took a minute to make the descent, but in an instant we were transported from the hot and dry sunlight of the upper world to the cool twilight of the lower regions. How did Jim follow? Why, down a wooden ladder. Two minutes had hardly passed before he stood beside us.

We were in the mile-long room. It is high and narrow and littered with boulders which made the way difficult, but not at all dangerous. What lay beyond? Far ahead we saw a broad shaft of light lying obliquely across our path, making our lamps unnecessary as we approached it. The light was from a natural entrance, though not used, in the side of the mountain. The hole is large, much larger than the shaft entrance, and widening downward like an inverted funnel, with a precipitous hundred-foot drop into piles of boulders making its use impossible without extensive work.

The King's Palace. Thousands of stalactites hang downward from a few inches to fifty feet.

But the bats use it. Numberless thousands of these little guano depositors make their home in the Cavern, departing through the natural entrance each evening to roam abroad, and returning each morning at daybreak to fasten themselves against the walls. It is a not-to-be-forgotten experience to see them issuing forth, a winged stream taking the form of a swiftly moving funnel, and one must stand well away as they return, darting through the hole with blinding speed, wings folded for the final downward swoop.

"Why," said Jim White, "we took guano from this cave for fifteen years. This room here and east of the bucket is a hundred feet high. When I saw this place twenty-two years ago the guano deposit was only eighteen feet below the ceiling and a quarter of a mile long."

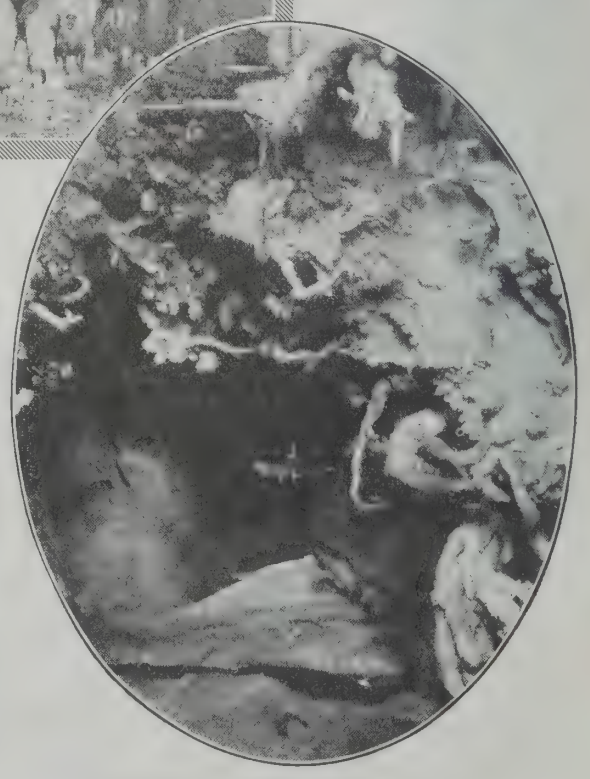
How long before man trod the North American plain was the first winged bat depositing his droppings in Carlsbad Cavern? In the fifteen years that Jim White mined out the guano as the fertilizer company's foreman he frequently worked crews of fifty men, and hoisted to the wagons above as high as 150 tons a day. The bat of today in his tiny ugliness more nearly resembles prehistoric form than any other living creature. Might he not have been, in the youth of the world, an enormous flying reptile with wings fifty feet across? *Must* he not have been of great size to have left such abundant record of his tenantry?

From the natural opening we passed into black darkness. Our lamps were but a flicker, but they threw fantastic shadows against stalagmites of lime carbonate, some with bases fifty feet thick, others so slenderly fluted that the lightest touch sent them crumbling. These were in the early making—their giant companions had been forming through unreckoned centuries and now were rearing themselves a hundred feet high to meet and join the stalactites hanging from the ceiling. This marvel of Nature had been wrought with water; not in a stream or even a trickle, but in the ageless process of drop by drop, evenly, methodically, patiently. They were forming—there can be no doubt of that—before the Neanderthal man tamed the first wild dog. Geologists can study the rock formations above-ground and fix the earth's age at 300,000,000 years. The ignoramus—even as Hunter and Jim and I—can descend to a cavern and with know-nothing eyes see that it's all true.

We picked our way on reasonably level footing to a pool of water formed in a hollowed-out sheet of limestone. It was the first water we found—cold, clear and deathly still. Whence came it? We could hear no drip from above, yet here it was, at our feet, giving back our features, our spectrally gray faces, against the gleam of our lamps. There is nothing more vibrantly alive than what the arid West calls "living water," and surely nothing seems so utterly dead as still water in a cave. We searched the depths with lamps held close: no fish lived there. Beside the pool was a squat stalagmite so startlingly like a recumbent lion that we named the place, with Jim's good-natured permission, Lion Fountain. The lime carbonate building this monster had formed in symmetrical layers, and the sides were dry and cold.

Then we began to drop. Jim led us to the edge of a fall-off so deep that fragments of rock dislodged by our feet tinkled away to nothingness in their fall, and so dark that our lamps barely reached the first ledge thirty feet below. Jim had been working in the cavern twenty years against the time when the world would come to his bucket. He has built a way down this terrifying declivity with hundreds of sacks, arranged as winding stairs, with a swaying wire handhold following them.

This was Devil's Den. We descended single-file, very slowly. Below the first ledge was another and wider ledge where the sack stairway gave way to level footing a score of steps. Then a ninety-foot ascent, again on slippery wet sacks, over a ridge which Jim had named Camel's Hump; and then a 400-foot descent to the entrance of a vast chamber more



Hanging pendants in Carlsbad Cavern.

gorgeous than man ever dreamed of, much less built. The entrance was canopied with draperies of delicate stalactite fretwork and the way thither was through an avenue of stalagmites of many shapes and colors, and each more beautiful than the one behind it.

This was the King's Palace. No king ever had such a palace. We came suddenly into a room of unbelievable proportions. It was without a single support, almost a perfect circle, one thousand feet in diameter and two hundred feet high, the floor perfectly level and carpeted with a velvet dust. Stalagmites had not formed here, but thousands of stalactites hung downward from a few inches to fifty feet.

The King's Palace is 750 feet below the hoist bucket and 250 feet below the level of the outside plain. It was in this thousand-foot auditorium, in the light of many torches, that the governors of New Mexico and Texas, with a party of 176 persons, including the highway commissions of both states, met a few weeks ago to pledge themselves to further the undertaking of creating a national park in the Guadalupe region, for the preservation for all time of the Cavern and the wondrous mountain country above it. At this meeting the highway commissions of the two states officially designated as state highways the route leading from Van Horn to Carlsbad, thence to the Cavern and around the base of the mountain. Women of Carlsbad turned the King's Palace into a dining room and served sandwiches and coffee to the entire party.

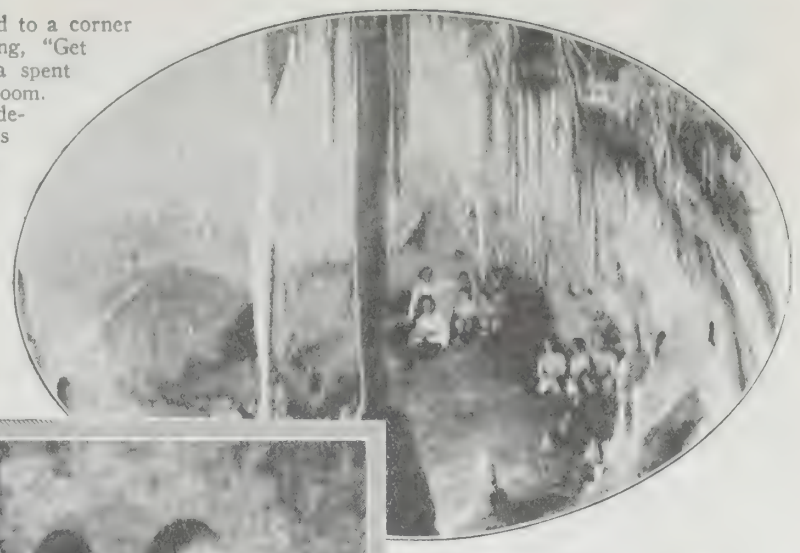
We, being neither official nor important, had brought our own provender, and so we lunched beside a subterranean pool in the Papoose Room, the smaller of two chambers opening off the King's Palace. Dr. Lee has suggested Indian names for many of these show places, drawing on Navajo mythology for his inspiration. A magnificent onyx column near the Cavern's entrance he has named Yeitso's Pillar. Devil's Den is Yeitso's Den, after the Navajos' mythical monster "whose blood formed Red River (the Colorado) and congealed in some places in lava flows when he was slain by the great god Sun." The King's Palace is Shinav's Wigwam, after the wolf-god Shinav, who, as the Navajos had it, used petrified trees for arrows in battle. But to plain Jim White, Shinav's Wigwam is the King's Palace, and Yeitso's Den gives way to the easier-said, and certainly the more suggestive, Devil's Den.

Pools in Carlsbad Cavern.

The climax of our tour was just ahead. Jim had reserved the Big Room for the last. We retraced our steps a short distance; thence through a narrow aperture so thickly studded with hanging pendants that we traveled on all fours lest we break them; then, suddenly, into a chamber in one corner of which the King's Palace might be swallowed.

It was sixteen city blocks in length and four blocks wide. The ceiling ranged from 150 to 250 feet in height. Fifty thousand persons could be seated in comfort; indeed, among a dozen potholes that once had held water were natural camp stools of crusted limestone and onyx, formed by the recession of the water, perfect in design and very comfortable. Hunter called them toadstools, while Jim suggested lily pads. Each consisted of a thin, crusted sheet, grown outward in concentric rings to a knife-like edge, and supported on bases a foot thick.

Jim lighted a flare. He retreated to a corner so remote that his shouted warning, "Get ready!" came to us as faintly as a spent echo. Then the light flooded the room. Stalactites, stalagmites, flowstone designs along the side walls, all in tints of snow white, clouded gray, deep black and faintly opalescent reds and oranges, leaped before our bewildered eyes. They ran in sizes from a few inches—there were millions of these tiny hanging jewels—to massive columns with bases fifty feet thick. They ranged in shapes from symmetrical totem poles to hideous monsters with leering faces and gleaming teeth.



Entrance to the King's Palace is canopied with draperies of delicate stalactite fretwork.

These giant stalagmite domes have been forming through unreckoned centuries.

In the center of the vaulted dome, at least 250 feet overhead, hung a 50-foot chandelier of white stalactites bordered with orange slashes and tipped in black.

We saw it all in two minutes. Then the flare flickered and died and we were again as ants crawling in the twilight gloom, raising our lamps in feeble efforts to pierce the veil—crawling to the edge of a precipice falling off sheerly 130 feet below the level of the Big Room, peering into a void as yet unexplored. What lies down there no one can say, not even Jim White. Once he descended on a rope and again on a wire ladder of his own making. But he did not go far. He showed us the ladder—a crude and frail thing anchored to an iron pipe thrust into holes in the limestone wall. He told how, on his first trip, it had turned over, leaving him dangling on the underside in imminent peril of death. "Would any of you boys care to climb her?" No, thanks. Some other time, perhaps.

Outward bound we stopped at a niche to inspect a pile of crumbled human bones. Many years ago, Jim White found the skeleton of an adult on that ledge, in a sitting position as though buried Indian fashion. Might it have been a prehistoric man? Jim did not know. Had he reported the discovery to the Smithsonian? No, that had not occurred to him. He had handed the skull to a local doctor, and the doctor had lost it! Jim is not a scientist, worse luck, but only an old-time cowboy who went down into a bat cave and spent the next twenty-two years exploring it for his own entertainment, with only a string to guide him safely back. Fragments of that string, rotted now, lay along our route. Jim refused to grow sentimental over them.

We came out in mid-afternoon without misadventure. The upward hoist was more breath-taking than the descent had been; Jim's homely countenance seemed positively beautiful to Hunter and me as our heads came level with the trapdoors and we saw him standing carelessly by the hoisting engine. We had truly seen one of the earth's wonders. Prior to the Geographic expedition not a hundred persons had ever stood in the King's Palace, so Jim said—and a transcontinental railroad only thirty miles away. Why? Because Jim White is not a talkative man. He is a cowboy—and an explorer.

One of the Colorado oil men had visited the Mammoth Cave of Kentucky. I asked him for a comparison. He said, very soberly, "You can multiply the Mammoth Cave by one hundred and still not do justice to this place."

The Carlsbad Cavern is a noteworthy addition to the geographical wonders of the United States. Few persons now traverse Southeastern New Mexico and few realize that mountains rise there to altitudes of nearly 10,000 feet. These mountains are carved by erosion into a remarkable series of sharp ridges and steep-walled gorges which are scarcely surpassed for rugged beauty.

The rocks of these mountains consist of limestone of late Paleozoic age, in thick, massive layers which slope gently in an easterly direction and pass under red sandy shale in Pecos Valley. The shale contains thick beds of gypsum and rock salt, which dissolve in the circulating underground water. The limestone also is soluble, but less readily than the salt and gypsum, and because of its greater resistance to the action of the water, the caverns in it are formed slowly, but become enormously large, and endure through long ages.

Carlsbad Cavern is only one of a dozen or more known to exist in Guadalupe Mountains, although little aside from their mere existence is known of these, even locally.

The plants near Carlsbad Cavern are of great interest to those unfamiliar with the Southwest. This part of New Mexico has a warm semi-arid climate in which thrive a variety of plants of amazing shape. These give to the landscape a strange aspect that is a source of never-ending delight to the visitor. However, to those for whom the novelty has worn away, these weird forms of vegetation are sources of annoyance and discomfort.

The predominating characteristic is thorniness. There are thorn trees; thorned shrubs with spike-like leaves; Spanish bayonets and Spanish daggers. This is a country of prickly pears and cat's-claws; sagebrush and greasewood; thorny mesquites and screw beans, and many less familiar but no less interesting forms of plant life. The beauty of the cactus in bloom and of the great flower stalk of the century plant is well known, but the equally gorgeous appearance of many of the other plants when in fruit or in flower is less familiar.

Probably the most interesting plant near Carlsbad Cavern—certainly the most prolific one—is the sotol, of which there are many closely related species. It consists of a spongy base a few feet high, crowned with hundreds of linear leaves about a yard long.

All photos (C) Ray V. Davis.

When Jim White's flare flooded the Big Room stalagmite totem poles leaped into view. Among other wondrous sights was revealed an exquisitely formed fringed shawl (on the extreme right).

When Pine Street Elbows Out Wall Street

A Series of U. S. Laws Give International Finance a World Grip; What the Schacht Gold Bank May Do, Free of Government Control

By HAMILTON YORK

In this, the third article of the series, the writer summarizes the sequence of events which led to the creation of a monopoly in control of American Trade.

PINE STREET, New York, begins at Broadway opposite Trinity Churchyard, runs parallel to and next north of Wall Street, past Nassau and then William, and finally meanders down to the East River. That block between Nassau and William streets, where the sunshine rarely seeps in, is the most important. The United States Subtreasury, with the big statue of George Washington in front, faces Wall Street, runs along Nassau street, and finally backs up on Pine Street. It faces, therefore, on three streets. The big shipments of gold from Europe and other places, usually packed in casks, are rolled into the Pine Street or rear entrance. Picked porters do the job, guarded by trusty men with guns. When the man who owns the gold desires to talk it over, he goes into the Wall Street or front entrance—if he doesn't talk over the telephone.

Halfway down Pine Street toward William is the International Acceptance Bank, Inc. Two brass signs flank the entrance. They are always beautifully polished. This is No. 31, and it is the bank of which Paul M. Warburg is "chairman of the board." As has been shown, he came to this country from Germany in 1902 for the purpose of reforming our banking and monetary system. How successfully he has done this, and in fact is doing it all the time, has already been told in this paper.

Pine Street's Financial Setting

DIRECTLY across the street at No. 30 is Goldman, Sachs & Company, and in the same building, Huth & Company. When the International Acceptance Bank was organized by Mr. Warburg, it took over the foreign exchange department of Huth & Company, and also the foreign credit business of the First National Corporation of New York, owned by the First National Bank of Boston. Until a few months ago, and for many years, the offices of Harvey Fisk & Sons were at No. 34. The place is now for rent. The most notable achievement of this firm in the world of finance was to find the money with which Mr. McAdoo built the Jersey tunnels under the Hudson River. It was ably assisted by Kuhn, Loeb & Company, a fact which may or may not be important.

Next door to where Harvey Fisk & Sons used to do business is the well-known organization of Hallgarten & Company. This is at No. 44 Pine Street. On the other side, again, between the International Acceptance Bank and the corner of William, is the Bank of Manhattan. Then across William street on the corner is Kuhn, Loeb & Company. Paul M. Warburg was for many years a partner there even as his brother Felix and Otto Kahn are now. The new Federal Reserve Bank building is only a short distance away toward the north. The next block south is Wall Street with Heidelbach, Ickelheimer & Company, in the building on the southwest corner. The Equitable Trust is in the same block.

This topography is given with some detail for, if the plans of Mr. Warburg and the Jewish Nationalists are carried to a successful conclusion, sight-seeing coaches will trundle through Pine Street instead of Wall. The main entrance of the Subtreasury will be where the gold is now carried in, and in turn the rear entrance will face Wall Street. George Washington's statue will stretch its neck but little to look in the windows of Speyer & Company, at No. 24 Pine Street, windows always neatly shaded by brown pongee curtains. The building is of beautiful white marble, the doors are works of art in bronze. The Speyer brothers, it will be remembered, are offspring of a famous banking family of Frankfort-am-Main, whose sister married Arthur von Gwinner, once head of the Deutsche Bank. James Speyer had something to do with the recent "reorganization" of the M. K. & T., while his brother, ex-Sir Edgar, is a man without a country. His apologist here was Samuel Untermeyer.

Debts and Starving Babies

ALL this will attract the glance of George Washington's statue, now in its new place. Alongside it will also be that remarkable bas-relief of Washington in an attitude of anxious prayer which now is at the side of the Wall Street front. The radical papers, of course, will continue to yell at Wall Street, as before, and grovel at Pine Street, but Wall Street will be only a memory. There will be nothing left but Pine Street.

In opening these articles, I promised to show that through the machinery set up by the Dawes plan, the control of the world's cover gold was about to pass into the hands of the group of internationalists that has been described here. With that control would go a power which the world has never yet seen. It carries an authority which is absolute though concealed.

The Dawes Report was given out for publication in Paris, April 9, 1924, and appeared in full in the morning papers of the United States, April 10. For weeks the world press, and particularly the press in this country, had been staging its appearance, carefully nourishing an expectant spirit which would insure a dramatic climax to the work of the committee. The spirit of the occasion was that Germany was so poor that it could not pay its debts and babies were supposed to be starving. General Dawes and his associates were to suggest a method by which the economic life of Germany could be rehabilitated. Germany could pay its debts to the Allies, and Germany could assume again its place in the world. To start was the question, and this indicated that outside *help* must be provided, principally from the United States. Suggestions of this character always include help from the United States.

The Dawes Report went over with a bang. Few understood it, but it was accepted by all as if the last word had been said. No word of real criticism has been uttered either as to the suitability of the methods to be employed or the suitability of the application of the methods.

It is very certain that if the plan suggested by the Dawes Report had not been acceptable to those who have their heel on Germany's neck, and who have co-racial friends, associates, and relatives in every commercial center of the civilized globe, there would have been discussion in plenty. Doubts would have been raised as to its advisability. Questions would have been asked. Finally, underground work like that which chloroformed Mr. McHugh's Foreign Trade Financing Corporation would have been started and the Dawes Report would have been thrown into the discard, never to have been heard from again. I stated that there had been no protests, but there has been one. It appeared on the inside page of a Chicago newspaper, inconspicuously placed. The date line was "Berlin, July 6," and it read:

> "The Dawes plan was made and inspired by Jews for the purpose of putting Germany under Jewish control," said General Ludendorff, the leader of the Voelkische or Fascisti party, in addressing "German Week" meeting of the Voelkische youth movement in Munich . . . . "This . . . . Jewish work means future slavery for the German people and also the complete crushing of the Germanic spirit."
> Rather remarkable—only one protest!

Facts About Organization

TO APPRECIATE the real significance of the Dawes Report, it is essential to keep in mind constantly the system which it is supposed to rehabilitate dominated by a hundred Jewish bankers who hold Germany in the hollow of their hands. Under ordinary circumstances it is quite impossible for the average reader to wade through a mass of technical verbiage which is to be found there. There is more than three-quarters which has only relative value in discussing the phase of the matter which is to be followed out here. So the essential features have been picked out, largely expressed in the words of the report.

The plan of organization of the new Bank of Issue for Germany as outlined by the Dawes Report follows. Portions are italicized for emphasis:

STOCK

The amount of stock is to be four million shares of one hundred gold marks each, all stock to stand on the same basis. *One million shares represent the assets of the Reichsbank,* presumably set aside in case the Reichsbank is made the bank of issue by suitable legislation or by merger. Three million shares are therefore left for sale under conditions which shall be most advantageous to the bank either in Germany or abroad, and must be paid for in gold or in gold exchange on foreign banks. The stockholders choose, directly or indirectly, the German national members of the General Board, "in such a manner and under such conditions as the stockholders of German nationality shall decide in accordance with German law."

TEMPORARY ORGANIZATION

COMMITTEE

President of the Reichsbank (Dr. Hjalmar Schacht).

One Member of Committee of Experts (Owen D. Young).

This committee is authorized to frame the statutes regulating the administration of the bank; it has power "if it deems wise to carry out this plan by the transformation of the Reichsbank under suitable legislation rather than by the organization of a new corporation"; it fixes the period of service of the Managing Board members appointed by the President, and its action is subject to the approval of the General Board; fixes the manner of selecting the first group of German members of the General Board, subject to the approval of the President of the Reichsbank; appoints foreign members of the first General Board, *subject to consultation with banks of issue of several countries involved.*

BANK ADMINISTRATION—

THE PRESIDENT

He must be a German national and is the chairman of the Managing Board and the General Board. He is also the Managing Director of the Bank. *For the first six months, the President shall be the president of the Reichsbank.* Subsequently, he shall be appointed by a majority vote of not less than nine members of the General Board, of which majority at least six votes shall be the votes of the German members. This appointment shall be countersigned by the President of the Reich.

Subject to such limitations as may be imposed by law, he shall perform duties as are assigned him by the bank's statutes. He appoints members of the Managing Board for the period to be fixed by the Organization Committee, subject to the approval of the General Board, and in turn countersigned by the President of the Reich.

With certain reservations, the President may be chosen from the members of the General Board or chosen from outside the board.

THE MANAGING BOARD

The administration of the bank shall be intrusted to the Managing Board, all of whom are to be German nationals, and under the chairmanship of the President. The method of appointment and term of service on this board has been indicated. Decisions shall be reached by a majority vote.

IT IS CHARGED WITH THE DUTY OF DIRECTING THE CURRENCY, DISCOUNT AND CREDIT POLICY OF THE BANK.

THE GENERAL BOARD

Consists of fourteen members, one-half of whom shall be German nationals and one-half made up from single representatives of England, France, Italy, Belgium, United States, Holland, and Switzerland. "Members of the German nationality shall be chosen in such a manner and under such conditions as the stockholders of German nationality shall decide in accordance with German law." The term of office is three years except in the case of the first election or appointment. The plan of selecting the first group of German members is to be determined by the organization committee with the approval of the president of the Reichsbank. The foreign members to be appointed by the organization committee with due regard for their qualifications and *upon consultation with the banks of issue of the countries involved.* After original organization, the foreign members of the board are elected by the board *on consultation with the banks of issue of the countries involved.* The number of German members may be increased by unanimous vote of the General Board.

In general, this board is given broad powers in such matters of bank organization and operation as might affect the interests of the creditor nations.

Under certain restrictions, it elects the Commissioner.

THE COMMISSIONER

The Commissioner shall be a foreigner. He is to be elected by a majority of not less than nine members of the General Board and the term of office is to be fixed by the Organization Committee.

His duties are to be present at meetings of the board; to enforce the provisions of the law and the statutory regulations relative to the issue of notes (paper money) and the maintenance of the bank's reserves which guarantee the issue. Notes shall be delivered only when authorized by the Commissioner.

GENERAL POWERS OF THE BANK

1. It has the exclusive right, with certain qualifications, to issue paper money in Germany for the period of its charter, fifty years.

2. It issues these notes for circulation against gold coin or bullion, statutory discounts, demand credits in foreign banks, *foreign commercial trade bills with maturities of three months or less,* taken at their present gold values at current rate of exchange. Notes or bills bearing less than three names of known solvency shall not be discounted.

3. The notes of the bank shall be redeemable in gold. At the time of inception, the situation will not allow temporarily of the application of the rule of convertibility. It, therefore, is suggested that a currency should be created which will be kept stable in relation to gold and, as soon as conditions permit, be placed on a convertible basis, like the present Reichsbank.

4. The new bank will serve as a bankers' bank, rediscounting the safest category of short-term bills and *so establishing an official rate of discount.* It will handle for other banks the Giro system for the transfer of bank credits. It will deal with the public, making short-time loans and discounts, effecting transfers and receiving deposits.

5. It will be the depositary and fiscal agent of the German Government, may make short-term loans to the government which are strictly limited, and the granting of such loans is carefully guarded.

6. The German Government is to participate in the profits of the bank but the bank is to be entirely free from governmental control or interference.

Right at the outset, consider the plan independent of its proposed setting. If one believes in capping a financial pyramid, if one believes in a central control of liquid capital, there is little to criticize in the Dawes plan. It is right up to date. To be sure, it allows the issuance of paper money against accepted bills of exchange either of German or foreign origin. It permits of that vicious cycle, expansion of credit and expansion of circulation. It, therefore,, perpetuates the system which had its origin in the country where it is now to be reimposed. All of this you may believe in, but I do not.

Jews Hold Germany's Wealth

AGAIN, this bank of issue for Germany is "entirely free from government control and interference." This "freedom from governmental control" *is one of the dangers in the present relationships between the government of the United States and the Federal Reserve Bank. It is one of the real dangers in other countries where central banks of issue have been established free from government control. Governments have delegated certain of their powers which, if the interest of the people at large is the paramount issue, should never have been delegated. The issuance of paper money is about the only business that the government itself should strictly control.*

Certainly, it is no way to help Germany to superimpose upon her a system which has already been her undoing. But, perhaps, that was necessary in the judgment of the Committee; and, perhaps, given the conditions, it really was necessary. On the other hand, if not responsible to the German Government, to whom is this gold bank of issue, this bankers' bank, responsible? Is it responsible to the German stockholders who have the power under the German law to elect the Board of Managers? And who are they? For all practical purposes, that means Jewish control, for the wealth of Germany today, especially since the collapse of the German mark, is in Jewish hands. Or is this bank responsible for its acts to the Commissioner? Only insofar as it affects the interests of the Allied nations. In all probability the Commissioner is to be Mr. Young. The fact that he is vice-president of the General Electric Company, and a director in General Motors and International General Electric is not without significance.

No, there is not much help for Germany in this sort of thing. It is pulling one's self up by one's own boot straps. The real answer lies in a general liquidation of the present banking and corporation laws of Germany with real responsibility to a genuine representative *republican form of government.* That is not the kind of government that the Jewish Nationalist likes.

The Sequence of Events

ALL this, however, is really beside the issue of our discussion. It is perfectly evident that even if Mr. Dawes had had all the facts in front of him, he was powerless to do anything about it.

Mr. Dawes recognizes that fact himself. It was said in the report:

> "As regards past history, it has not seemed necessary to establish the causes nor the responsibility for those causes which have operated to produce the present state of German finances and currency, except insofar as recognition of their character is required for the prescription of the remedies."

Which means that the committee could not go beneath the surface of things at all, for if it had there would have been no Dawes plan. He may have known and probably did know all about it, but what could he have done?

To continue:

> "Finally, convinced, as we are, that it is hopeless to build any constructive scheme unless this finds its own guaranty in the fact that it is to the interest of all parties to carry it out in good faith, we put forward our plan relying on this interest. We hope the character of our plan will itself assist in securing this guaranty, which is essential for its execution, but in the main, of course, it must be for others to take such measures as are necessary to maintain and assure it."

On July 1, 1924, the writer went on record as follows: *"I can positively assure both Mr. Dawes and Mr. Young, who comprised the American Committee, that there will be absolutely no difficulty as far as Germany is concerned, either in the acceptance or the operation of the Dawes gold bank of Germany.* It is exactly what our International Jewish Nationalists desire." Subsequent events have proved the accuracy of the prophecy.

Then the Dawes Report continues:

> "If political guaranties and penalties intended to secure execution of the plan proposed are considered desirable, they fall outside the Committee's jurisdiction. . . . It is, however, our duty to point out clearly that our forecasts are based on the assumption that economic activity will be unhampered and unaffected by any foreign organizations other than the controls herein provided."

In using the word "foreign" the committee indicated France and the general reference was to the Ruhr. However that may be, the committee in effect says that if any chicanery, political or otherwise, is attempted, it washes its hands of the results. Naturally. That releases the committee from any responsibility for failure due to those causes. If there is a sure bet in the world, it is that eventually there will be a lot of it.

Another collateral question: To what extent was the Dawes plan, aided and abetted by Mr. Young, forced on the committee? The available answer to this may best be stated in chronological form. Watch the events dovetail.

April 12, 1921

Formal opening ("ready for business") of the International Acceptance Bank, Inc., of No. 31 Pine Street, New York.

1921-1924

Various meetings between Paul Warburg and his brother Max of Hamburg. According to the *Literary Digest,* Walther Rathenau's murder was the 378th of a political type in Germany beginning with the death of Scheidemann. The date was June 24, 1922. Two months later, in company with his brother Paul, Max was discovered in the cabin of an inward bound steamer nearing New York. He was much disturbed because he had been recognized. His family was in France. While in Hamburg and after the murder of Rathenau, the police of that city had forbidden him to leave his house.

March, 1923

Congress passes the Federal Farm Loan Act which authorized issuance of paper money by the Federal Reserve Bank on bills of exchange, and authorized the Federal Reserve Board to rediscount bills of exchange, making it possible to rediscount Schacht gold bank acceptances. The Federal Reserve Board did not make use of this power until May, 1924.

1923

Otto Kahn says that there is no such thing as an international banker.

March 12, 1924

The Schacht gold bank was incorporated by special Act of the Reichstag.

April 7, 1924

The Schacht gold bank was opened in Berlin and "ready for business."

April 9, 1924

The Dawes Report was published. It says among other things: "One of the first steps which the Committee took was to request Dr. Schacht, the Governor of the Reichsbank and the Currency Commissioner of the Reich, to give evidence before them with a view to their being fully informed of the existing currency situation." Later, the report states: "While coming to this conclusion and while reducing the general plan to details, the Committee . . . . was informed that a scheme for a gold bank was in preparation. It was expressly and admittedly limited to providing the means of carrying on foreign trade. When first submitted it contained some features which the Committee would not have recommended, and it omitted others which seemed to the Committee to be essential to any permanent settlement of the problem as a whole. Moreover, an attempt to settle particular difficulties in isolation and without reference to other essential requirements appeared to the Committee to involve certain risks. The Committee, therefore, without expressing any opinion on the plan as given to them in outline, assured themselves in consultation with the authorities responsible for Germany's monetary policy that the bank would be so organized as to facilitate its absorption into a new bank of issue which might be set up in accordance with the recommendations of the Committee."

April 24, 1924

The International Acceptance Bank, Inc., announces that a gold credit of five million dollars has been extended to the new Schacht bank of Berlin in which credit a syndicate of American banks would participate.

May 14, 1924

Meeting of the Advisory Council of the Federal Reserve at Washington, Paul Warburg in the chair. The Federal Reserve Board in conformity with the authorization of the Federal Farm Loan Act of 1923 was asked to "take every possible step to aid in the financial readjustments incident to the creation of the German Bank of Issue proposed in the Dawes Report." The recommendation was promptly acceded to.

June 10, 1924

It was announced by the International Acceptance Bank that the first of the German trade bills from the Schacht gold bank of Berlin to the amount of one million dollars had arrived.

June 12, 1924

The Schacht gold bank credit was increased to twenty-five million dollars by the International Acceptance Bank, it being announced that thirty-four other banks would participate in the syndicate. It is, of course, impossible to conceive that absorption to this extent of this form of credit would be possible without the Federal Reserve Bank acting as a buffer. Owing to the development of the mechanism provided for in the Dawes Report, this credit has since been withdrawn.

June 20, 1924

A Berlin dispatch states that Otto H. Kahn has been offered the fifth place on the foreign control railways under the Dawes plan.

Did these successive events take place by accident or design?

What else could General Dawes do?

This financial question, in its broadest sense, is not a question of bills of exchange in the form of acceptances being rediscounted in our Federal Reserve banks through member banks and the International Acceptance Bank. It is much broader than that. At the present moment, such bills of exchange from Germany are now being rediscounted by the Bank of England and have been for some time. Similar bills of exchange can be rediscounted by banks of issue in other commercial and financial centers. In turn, most banks of issue now rediscount bills of exchange arising in any recognized commercial country.

The Consumer Pays

THIS of itself is not dangerous or of any moment. From one point of view, it is very desirable and facilitates the consummation of international trade, that is, if one believes in using bank credits and *paying for them,* in every crook and turn of business procedure. The consumer eventually pays for it, and in that form the cost becomes an overcharge on business to that extent—which is one of the causes of high prices. The fact is that *the banker at present is charging too much for his services.*

Some of the acceptances which are now reposing in the vaults of member banks of the Federal Reserve System bear four and five indorsements, these indorsers splitting discount fees up to fifty per cent for sixty AND NINETY DAY DISCOUNTS. Prices under such circumstances are only limited by production in countries foreign to Germany.

What is happening in Germany all this time? The Dawes plan provided that the Schacht gold bank should be for the present an interim central bank, a bank of issue, to be merged later into a bank which is to be for fifty years the bank of issue for Germany. It is provided that the charter of the Reichsbank may be so changed by legislation of the Reichstag as to conform to the Dawes plan, and thus become with the Schacht bank the final "Dawes bank" if it can be referred to in that way for convenience. The capital of this new bank is to be four hundred million gold marks, one hundred millions of which is to be used to purchase the Reichsbank, in case its absorption is deemed advisable. The present board of directors are about 99 44/100 per cent Jewish nationals as opposed to German nationals, and they are responsible for the present condition of the monetary system in Germany. Dr. Schacht himself is president-governor of the Reichsbank and is also currency commissioner for the Reich. Under the Dawes plan, the government has absolutely no control over the operations of this new bank of issue. That makes no difference anyway because in Germany the banking system and the state are coextensive. In making provision for the absorption of the Reichsbank and the purchase of its assets, the interests now dominating the Reichsbank will, of course, receive proportional representation on the board of the new bank of issue. Jewish nationalism gets a good start.

Setting Up a New Method

THE Dawes plan also provides that this bank shall be managed by a board of managers who are to be native Germans, but it does not exclude Jewish Nationalists. The latter, as has been shown, dominates the board. To the board of managers is given authority to "direct the currency, discount, and credit policy of the bank."

The Dawes plan also provides:

> (a) The bank shall have the exclusive right of issuing and circulating bank notes in Germany during the period of its charter . . . .(b) The bank may issue notes for circulation against gold coin or bullion, statutory discounts as defined in Section 9, demand credits in foreign banks *and foreign commercial trade bills with maturities of three months or less taken at their present gold values at current rates of exchange.*

It will not take a professional expert in a university to realize the power which will naturally evolve out of such a situation. Arbitrary fixation of exchange rates as opposed to that natural fixation which follows the international exchange of goods and products is not only probable but certain. It sets up a new method of international exchange based on credit which is expressed in terms of gold but which in reality depends on the ability and willingness of individuals to pay. Gold is thereby simply a term expression. The system can bring prosperity to one country and poverty to another. It can crush any individual or group of individuals who refuses to kotow to their overlords.

Turkeys for Thanksgiving March to Music of Band

Bird Is Absolute Monarch of Dinner Table

By EARLE W. GAGE

THE first time that Thanksgiving Day and the turkey were brought into intimate relation was in 1621, when Governor Bradford, of Plymouth Colony, set aside a day to celebrate the gathering of the first American harvest—made by the Pilgrims who had come over in the *Mayflower* the year before. This initial harvest had saved the colony, and incidental to the religious features of the occasion the governor sent forth four men with their flintlock fowling pieces to procure meat to grace the festive board that the colonists "might, after a more special manner, rejoice together."

When America was first explored by white men, wild turkeys were found in large numbers from New England to Mexico. History shows also that turkeys had been raised in a domestic state by the Aztecs of Mexico at a still earlier period, and that they were introduced into Europe by white explorers and were there greatly prized as a table delicacy upon important festive occasions.

In the days of the Pilgrim Fathers wild turkeys still strutted in unrestricted pride and splendor through the forests of New England, in great flocks. Doubtless the then friendly red man had introduced the early settlers to the creamy taste of the white and the succulence of the dark meat of the turkey; so wild turkeys were the quest of hunters, and constituted the *piece de resistance* of the first Thanksgiving Day table.

From that good day to this the turkey, either wild or tame, has occupied the place of honor at the American Thanksgiving dinner from the eastern tip of Maine to the Golden Gate, and from the most northern border to the magnolia-scented shores of the Gulf of Mexico.

Just why the bird should have been called "turkey" in the English language no one seems to know. The realm of His Sultanic Majesty had no more to do with the introduction of the bird into polite society than did Greenland or Kamchatka. The real turkey is a bird indigenous to North America and was from here introduced to the rest of the world.

It may be that since the bird was brought to Northern Europe from Spain it was concluded that, like many other unusual things, it came from Turkey or the Near East. Again, the bird may have named itself, since the call of the hen to her chicks sounds very much like "tur-r-r-k, tur-r-r-k, tur-r-r-k." At any rate, there is no actual connection between the bird and the country of the same name.

The turkey was a favorite fowl among the aboriginal inhabitants of America. It has its habitat over all that section where grew its favorite food—Indian corn. When Cortez, in 1519, first reached the realm of the Aztecs, Montezuma entertained him with royal splendor, and among the delicious viands set before the Spanish invaders was roasted turkey. It was found that the Aztecs had domesticated the fowl to quite an extent, and that it was also plentiful in its wild state.

North of the Rio Grande the bird was well known, and the adventurous Coronado found it among the cliff dwellers and other tribes he met on his expedition through what today is Texas, Arizona and New Mexico.

The Zuni Indians seem to have known of the turkey for centuries, and some of their earliest traditions deal with this interesting bird. Not only did the bird serve as a delectable food, but its feathers formed a valuable feature in the headgear of the Indians, for embellishing the garments of the women, and for lending accuracy to the flight of arrows. When the English settled Massachusetts they found wild turkeys in abundance, and other colonists found them from New England to Florida.

The wild turkey of America is without doubt the progenitor of all kinds of turkeys the world over. Ornithologists in general accept the view that all turkeys have descended from the three forms known today as the North American, the Mexican, and the Honduras varieties. The bird found in certain forests of South America known as the curassow, although sometimes called the South American turkey, in reality belongs to a different family; and scientists hold that any real turkeys found in that continent are immigrants.

The Mexican turkey, wild throughout the republic, is known to science as *Meleagris Mexicana*. It is short in shank, the feathers of its body are metallic black, shaded only slightly with bronze, while all its feathers are tipped with white. This appears to be the species first taken to Spain and other European countries. It is thought that the white markings of its plumage appear in the variety of domestic turkeys known as the Narragansett.

The North American turkey, *Meleagris Americana*, is the original species of Eastern United States. Its colors are black, beautifully shaded with a rich bronze, the breast plumage being dark bronze, illuminated with a lustrous finish of coppery gold. All this emblazons the plumage with a distinctive brightness, and in the rays of the sun the burnished appearance comes out with striking brilliancy.

Wild turkeys are still found in some of the more unsettled sections of their former range, especially in the wooded and mountainous regions of Arizona, Texas and New Mexico, and the large swamps of the Gulf of Mexico. The nests of these fowls are occasionally discovered and the eggs given to farm hens or turkey hens to hatch.

By judicious breeding and feeding, turkeys have been increased markedly in size since domestication. Wild turkeys of today average in weight about twelve pounds for young toms and nine pounds for turkey hens, while the standard weight of domesticated Bronze turkeys is twenty-five pounds for toms and sixteen pounds for hens of mature age.

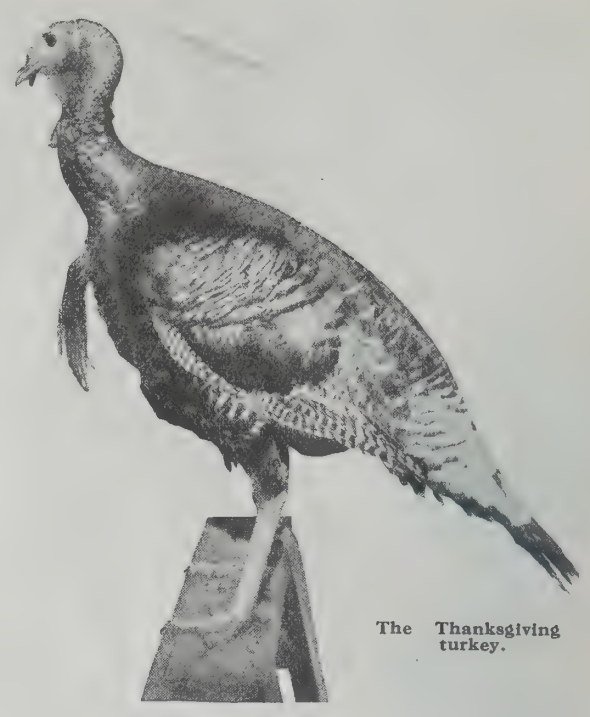
The present demand for Thanksgiving and Christmas turkeys is enormous, and to fill this demand carloads of turkeys start reaching the city markets about the middle of November and continue well through December. Should there be a surplus at Thanksgiving time, those unsold are held for Christmas. By this method the market is not flooded at any one time.

As near as can be calculated, about one-tenth of the total supply of turkeys is produced in Texas, almost as many in Missouri, after which comes Indiana, Illinois, Kentucky and Ohio, in order named. In New England, which formerly was famous for its well-fattened turkeys, production has decreased to small proportions, although its reputation survives. But in Texas, where there is an abundance of range suitable for turkeys, flocks of several hundred are common. Throughout the Middle West, flocks abound, which are permitted to graze on the grain fields, where they pick up their living after the harvest machines have passed.

A turkey march in Texas.

In the unsettled foothill country of California, turkey ranching is the most recent agricultural industry to develop. Here the range is unlimited, and the natural food of the fowl—grasshoppers, green vegetation, seeds and grasses, are abundant. Advantage is also taken of the turkey's great relish for acorns, and where these are plentiful but little grain need be used for fattening them for market. These large flocks are managed much like sheep, being taken out to range early in the morning and brought back to roost at evening. They are herded during the day by men, either on foot or on horseback, and by trained dogs.

In nearly all large turkey-raising districts dressing plants have been built to handle the turkeys during November and December. Farmers either bring the turkeys in wagons, or drive them in large flocks.



The Thanksgiving turkey.

At the dressing plant, gangs of men and women dress the fowls according to the approved methods, these plants looking much like the center of activities of "Packinghousetown." The dressed fowls are placed in large cooling rooms, there to await thorough cooling, after which they are packed in boxes and shipped in refrigerator cars to the large cities. Since the fowls shrink to a shocking degree, when shipped to market alive, if for any great distance, most long-distance points from market dress the fowls.

One of the longest shipments of live turkeys that is ordinarily made is from Tennessee to New York City. Twice each year, once for the Thanksgiving and once for the Christmas market, a train known as the "turkey special" is made up at Morristown, Tennessee, and is rushed through to the metropolis. Each car contains from 1,500 to 2,000 turkeys. One man is sent with each car, whose duty it is to feed and water the birds and to see that they are weighed correctly when unloaded.

Picture a wide street, flanked by gaily decked buildings, brass bands playing martial music, and down the center of the sun-flecked pavement thousands of turkeys sedately marching, row upon row, until they stretch into the distance in shimmering colors of red, white and bronze.

This unusual picture may be visualized in several Texas towns just before Thanksgiving, especially in Cuero, "home of the famous Turkey Trot," and largest shipping point for dressed turkeys in the world. Just before this holiday, the community pays homage to its most famous and profitable crop, and celebrates the end of the turkey season with appropriate ceremonies. The turkey reigns as uncrowned king of the festival, although he needs must lose his head to achieve that distinction.

Texas supplies the United States with one-tenth of the turkeys to grace the Thanksgiving and Christmas festive tables. The state provides an abundance of range suitable for the fowls, flocks of several hundred being common. In the turkey-raising districts large dressing plants have been built to dress the fowls for market. Farmers either bring the turkeys in wagons, or drive them in large flocks. In one case, 8,000 turkeys were gathered together at one place in Texas and driven by thirty men a distance of a dozen miles.

In turkey driving, a wagon is driven just in front of the flock and corn is scattered to the leaders to keep them moving. At nightfall, provision is made to stop under a grove of trees where the turkeys may roost, the journey being continued as soon as they fly down in the morning.

Two or three days before the turkey parade, thousands of turkeys are started on drives to the assembling station. Bright and early the morning of the turkey march, the mighty battalions, reinforced from every direction by squads, companies, regiments and divisions, arise, rested and eager to resume the march, flap their wings, loosen up their vocal organs, and willingly follow their leaders, who pursue the trail of grain. The bronze privates, the fluffy white corporals, the dull red second lieutenants, the coal-black sergeants and the golden majors, throw out their chests a trifle farther, as they pass the review stand, and add to their gait a slightly more pronounced swagger.

On and on go the turkey marchers, "trotting" to the tune of bands, closer and closer to the ignoble fate that lies at the end of the long and treacherous maneuvering. With admiring throngs to the left, applauding multitudes to the right, the turkey soldiery marches straight through the open gate and into the very "jaws of death."

At the end of the parade there is a big corral, an army of killers, pickers and packers. But save for this band of heartless experts, a large number of homes would not possess the *piece de resistance* to grace their holiday board.

How News First Got Into the Newspapers

Concluded from page 3

the New England *Courant*, during the period when Franklin was setting type and writing copy, has only recently come to light through the patient and clever work of Dr. Worthington C. Ford, the distinguished secretary of the Massachusetts Historical Society. Dr. Ford's search carried him to the British Museum which held the complete run from Nos. 1 to 111 under the title, "Newspapers, 1721-1727." In this file, which ends at the time Franklin left his brother's establishment, the articles by Franklin are initialed B. F. This is probably Franklin's personal copy of the newspaper and the earliest Colonial paper in which the authorship of the articles is established.

Other early Massachusetts newspapers with interesting titles are represented by the following list:

The New England *Weekly Journal*, 1727; the Boston *Weekly Post-Boy*, 1734; the Boston *Evening Post*, 1735 (This paper continued to appear until after the battles of Lexington and Concord. On April 24, 1775, the *Post* stated that publication would cease "till matters are in a more settled state." Publication was not resumed); the *Independent Advertiser*, 1748; the Boston *Chronicle*, 1767; the Essex *Gazette*, 1768 (Subscribers in towns between Salem and Newburyport were supplied by a Post-rider. Samuel Hall, the editor, engaged a special messenger to bring the latest news from Boston each Monday, before publication of his paper on Tuesday); the Massachusetts *Spy*, July, 1770.

On July 7, 1774, when the British troops occupied Boston, Isaiah Thomas, the printer and editor, placed a dragon (Great Britain) and a snake divided into nine parts, representing the Colonies, with the motto "Join or Die," as an illustration at the head of his paper.

One other early title, *The Moral and Political Telegraphe;* or Brookfield *Advertiser*, deserves especial mention. The term "telegraph" refers here to the system of elevated stations from which messages were transmitted by a system of signals. Morse termed his device the "magnetic telegraph," but with the disappearance of the elevated stations "magnetic" became unnecessary.

The second colony to support a newspaper was Pennsylvania, where Andrew Bradford presented in 1719 *The American Weekly Mercury*. New York followed some six years later, October 16, 1725, with the New York *Gazette*. Printing in Pennsylvania and New York was introduced by the Bradfords and the first newspapers were due to the same family. William Bradford was more than 70 years old when he began the *Gazette;* his son Andrew was sponsor for the *Mercury*.

In 1728, Samuel Keimer established *The Universal Instructor in All Arts and Sciences and Pennsylvania Gazette*. After some forty numbers the paper and the name were turned over to Benjamin Franklin. In 1766 Franklin retired from the Pennsylvania *Gazette* and the printing business, receiving from David Hall 1,000 pounds per annum for a number of years for his share of the profits.

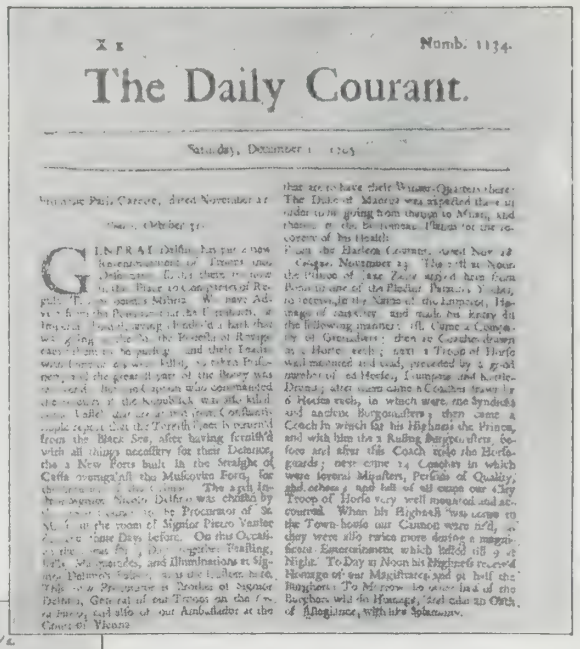
The second New York newspaper, the New York *Weekly Journal*, was established in 1733 by John Peter Zenger as an organ of the opposition. The biting criticism of the government, characteristic of the New York press of a later day, led to the arrest of Zenger for libel. As a result of the trial the freedom of the press in America was, if not established, at least greatly furthered, and Zenger's name is placed high in the story of American journalism.

West of the Alleghanies the first newspaper was due to another Bradford, John by name, who began *The Kentucke Gazette* on August 11, 1787. In Michigan, for example, the newspaper did not make its appearance until 1809. The first was entitled Michigan *Essay*, or *The Impartial Observer*, and was published by James M. Miller. This Michigan *Essay* and a paper with an account of Washington's death have been frequently reprinted in facsimile; the originals have real value but the facsimiles are of value only as curiosities.

During the War of the Revolution a group of New York papers combined so that newspapers appeared daily. However, the first real daily newspaper was not founded until in 1784 with the *American Daily Advertiser* of Philadelphia. A daily newspaper was attempted in London as early as 1702, and in Paris in 1709. The *Argus* or *Greenleaf's New Daily Advertiser* appeared in 1787 in New York. The titles indicate one of the main sources of revenue of the new ventures in American journalism; in general the whole front page was devoted to advertisements. The New York *Herald* continued this practice for many years. As late as 1810 only seven cities in the United States supported daily newspapers. At this time even Boston, Albany, Providence and Washington were being served by weekly and semi-weekly papers.

The early papers were issued in the afternoon. In 1796 the *New World* in Philadelphia attempted morning and evening issues but expired after a few months.

The Sunday newspaper did not make its appearance until 1825 with the *Sunday Courier* of New York. For many years a definite prejudice existed against the Sunday issue and the violation of the Sabbath certainly would not have been permitted in Colonial times. History hardly considers it worth while to record when the Sunday supplement and the Sunday comics made their unfortunate entrance upon the stage. The New York *Graphic* of 1873 was the first regularly illustrated newspaper. Before the Revolution the English names of *Gazette, Mercury, Journal, Courant, Post,* and *Post Boy* were most popular. However, directly after the Revolution, *Democrat, Republican, Patriot, Federalist, American,* and *Palladium* became the popular catchwords. For many years in Boston, even as late as 1845, the price of American newspapers was most commonly six cents a copy. In 1833 the New York *Morning Post* with Horace Greeley as one of the publishers appeared as a penny paper. It is rather striking that the New York *Evening Post* is now one of the few five-cent daily papers in the East.



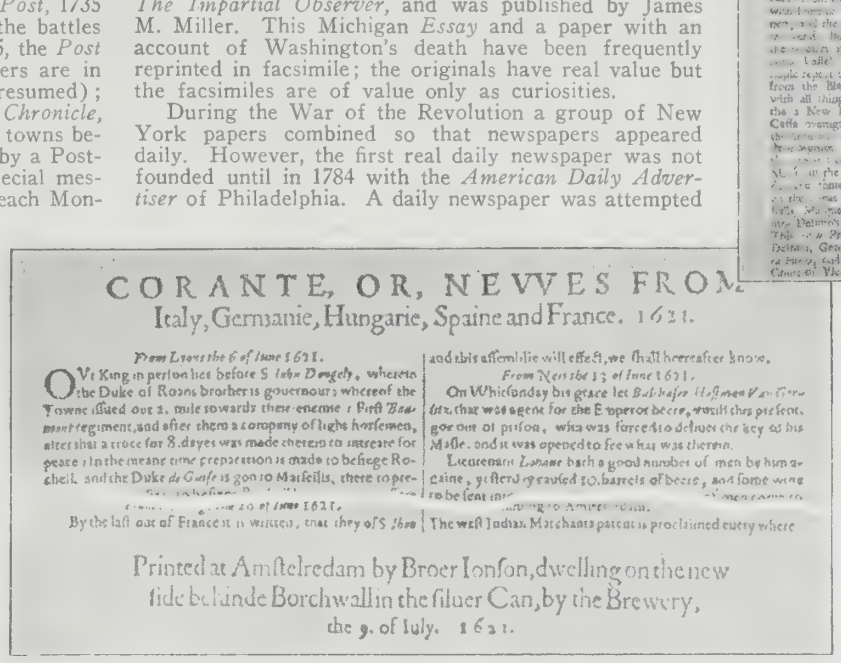
X x Numb. 1134.

The Daily Courant.

Saturday, December 1 1705

GENERAL Dalton has put a new Government in Tuscany, and Commissioners [illegible] there to govern in the Place of the Regency of Regalia. [illegible] Advices from Portugal mention, that the Duke of Marlborough was expected there in order to his going from thence to Milan, and thence to the Emperor's Camp for the recovery of his Health.

From the Harlem Courant, dated Nov. 28 Cologne, November 23 The 21st at Night the Palace of Count Zinzendorf was entirely consumed by Fire, and the Count himself narrowly escaped with his Life. We have Advice from Ratisbon, that the Elector, after having received the Visits of the Ambassador, Hostages of Canterbury, and made his Entry in the following manner: 1st, Came a Company of Grenadiers; then 10 Coaches drawn by 6 Horses each; next a Troop of Horse well mounted and clad, preceded by a great number of led Horses, Trumpets and Kettle-Drums; after them came 8 Coaches drawn by 6 Horses each; in which were the Syndics and ancient Burgomasters; then came a Coach in which sat his Highness the Prince, and with him the 2 Ruling Burgomasters, before and after this Coach rode the Horse-guards; next came 24 Coaches in which were several Ministers, Persons of Quality, and others; and last of all came our 3 Troop of Horse very well mounted and accoutred. When his Highness was come to the Town-house our Cannon were fired, as they were also twice more during a magnificent Entertainment which lasted till 9 at Night. To Day at Noon his Highness received Homage of the Magistrates, and at half the Burghers. To Morrow to whom [illegible] of the Burghers will do Homage, after which an Oath of Allegiance, with the Solemnities



CORANTE, OR, NEWES FROM Italy, Germanie, Hungarie, Spaine and France. 1621.

Lieutenant *Lowne* hath 8 good number of men by him again, yesterday raysed 30. barrels of beere, and some wine to be sent in-

[illegible] Amsterdam.

The west Indian Marchants patent is proclaimed every where

Printed at Amstelredam by Broer Ionson, dwelling on the new side behinde Borchwallin the siluer Can, by the Brewery, the 9. of July. 1621.

The first English news sheets were printed in Amsterdam in 1620 and 1621 and sent over to England. These contained foreign news only.

The term *Courant* as applied to a newspaper was taken from the Italian term "corranto" which was used for accounts of current events.

Some Fundamental Facts About Fiction

Concluded from page 4

worst of times"; when Jane Austen starts "Pride and Prejudice" with "It is a truth universally acknowledged, that a single man in possession of a good fortune must be in want of a wife," or when Edith Wharton, in "A Son at the Front," opens with "John Compton, the American portrait-painter, stood in his bare studio in Montmartre at the end of a summer afternoon contemplating a battered calendar—," we are aware that, in each instance, we are going to read a more or less connected series of episodes revolving about certain groups of people who have already acquired the reputation, among a host of readers like ourselves, of being interesting. And more than that, for they undoubtedly will reveal much of ourselves. In this respect, therefore, a novel must be wholly different from a play. Yet its skeleton framework ought to be the same. In both cases, living people are acting out themselves, *voicing* themselves. Balzac said once: "Let us now talk of realities, let us talk of my characters." When I am first introduced to a man I have never before met, I visualize his appearance—clothes, bearing, and so forth—in the fraction of a second.

Many of our most notable novelists have often been fooled because they have thought the success of a book was due to the theme, or idea, rather than to the principle I have indicated. Last year Charles Norris' "Bread" had a run because, superficially, it dealt with the problem of the young woman in business. Similarly, Gertrude Atherton's "Black Oxen," because it carried glands. The popularity of "Main Street" and "Babbitt" are thought to be due to the theme, to the thing which, in our American manner, we say is "in the air." The selling qualities of a title, the theme or problem, commercially speaking, should not, of course, be minimized. But the fact is that these books, and others like them, stand or fall by what their characters say. A novel is successful insofar as it conveys to us the things we already know, by people who talk to us out of themselves in words that we understand. No doubt we experience a glow of reminiscent delight in recalling Dickens' description of a fat boy or a pony, but this is nothing to the remarks of Mr. Pickwick or Dick Swiveller.

And, in closing, I cannot but repeat what the inimitable Ring Lardner said to me when I once asked him his secret of his art in portraying certain types of American character so accurately. He replied:

"I listened."

Dombey and Son Still Live in Shanghai

Concluded from page 5

the bride wore many gowns, and heavy decorations. The day was very hot and the sedan chair in which the bride was carried was fully covered with heavy goods, heavily embroidered, leaving practically no ventilation—hence the suffocation and death of the bride. The bride was dead when she reached the home of her groom."

And speaking of marriages and deaths in the same breath, there is a strange marriage custom still recognized in many parts of China. If a son dies unmarried, his parents select a go-between, or professional matchmaker, and then order him to find a family in which a daughter of about the same age had died. It is necessary that this girl shall have died at about the same time as the boy. Just as though the two were living, the arrangements for their marriage are made and the betrothal and wedding ceremonies are carried through, the tablets of the young people taking the place of the bride and groom in all the festivities. The coffin of the bride is then placed beside that of the groom in the family burial ground and the dead girl is from that time on looked upon as the deceased daughter-in-law in the young man's family.

In a community between Shanghai and Soochow there is a custom of "warming the grave." In most parts of China the coffined dead are placed on top of the earth, and graves, some of them of great height, are built up over them. However, in this little settlement referred to they dig a shallow grave for their dead. If it is for an old man, his eldest son goes to the grave the night before the coffin is to be placed in it, and lies in that shallow grave all that night. This is called "warming the grave."

Early in the evening the priests will congregate about the grave and chant their ancient incantations, a prayer beseeching blessings on the dead. The young man who is to show his filial duty in this gruesome way will kneel on the ground before the priests and strike his head on the earth thrice, then he will step into the grave and lie down in it, while the priests continue their chant and after marching three times around the grave with its living occupant, they will go off through the fields leaving the young man alone in the night to warm the grave with his young body that the aged and revered father shall not feel the chill of death.

In the canals which give Soochow the name of "The Venice of the Orient," men fish with cormorants. True, in some other parts of China, they also use these birds for this purpose, but it is the ancient industry of Soochow, being an old industry there even in the time of Confucius. The fishing boat is a long narrow one. and the big black birds are tied with strong ropes at the sides of the boat. The birds are kept hungry till night, and therefore are keen-eyed for the fish that play about in the murky waters. When they spy one they dive for it, generally bringing it up in their beaks, but the rather tight ring around the necks of these birds prevents them from swallowing the fish.

It is said that a Chinese fisherman does not dare starve his cormorants. One did so once in the legendary long ago. The story has it that he starved them so long that they grew angry, and one morning when he started out with his boats and his birds, they just flapped their wings, and took boat and fisherman up out of the water, and away over lowlands and mountains, and the old fisherman was never seen again.

Grange—Newest Pigskin Furore

Concluded from page 9

to get several pass receivers down the field and Grange has two or three targets for his passes. He not alone throws the ball well from a stationary position but he makes accurate passes while running.

Michigan had been told just how Grange runs. The plays on which Grange runs had been diagramed to the Michigan players and they studied them two weeks before meeting Illinois. Michigan knew each time that Grange was to take the ball and still Michigan was unable to stop him. In the Michigan backfield were two of the fastest men in the Western Conference. One of them has been timed repeatedly sprinting 100 yards in 10 seconds flat. Grange made these fleet backs appear to be standing still. Just as they were about to leave their feet to dive for him Grange would put on a few more ounces of speed and make them miss by a few feet. His change of pace is the most deceiving any backfield man ever had. Even when a tackler reaches him he finds Grange a most elusive object. He is hard to tackle because of his shiftiness and hard to bring down even when the tackler is in front of him because he carries his knees so high that the grip of most tacklers is broken by the knee action.

Grange always has the "extra" ounce. He always has enough reserve to make the supreme effort when the occasion arises. He puts on steam at the right time. He knows what to do, when to do it, and how to do it. He is physically and mentally equipped. He has that perfect rhythm which you read so much about and so seldom see. He is the most useful and the most dependable scoring weapon that football has found in any of her individual stars. He is thorough but also flashy. He is football's greatest thrill maker.

And now we trust that you, who have never seen this red-headed superman, will realize why he is the greatest broken field runner of all time.

UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

The first serious attempt to cross the Atlantic with a dirigible was made October 15, 1910. The dirigible *America,* which embarked at that time from Atlantic City, ended in disaster less than seventy hours later.

There are two hundred fifty-three one-way streets in New York City.

High fur prices have brought prosperity to the Eskimos who are abandoning their primitive "kyaks," or canoes, for auxiliary schooners bought in Edmonton, Alberta. Sewing machines are in general use among these people.

Explosive mines, relics of the war, are still floating about in the Baltic Sea and in the English Channel. A ship from Antwerp recently reported a mine off the Goodwin Lightship in the channel, and two others were reported nearby by the captain of a vessel sailing from Russia.

Students at Indiana University at Bloomington, Indiana, are not permitted to motor outside the city of Bloomington and are denied the privilege of possessing an automobile while attending the university. The ban was placed on automobiles because of poor scholastic standing, according to the dean.

Men who bootleg immigrants receive from $10 to $1,000 a head. At a low average of $150 each, with an estimated total of only 50,000 a year, the alien smugglers obtain in the neighborhood of $7,500,000 annually.

A scar on a tree caused by barbed wire cutting on the trunk three feet from the ground when the tree is ten years old will still be three feet from the earth when that tree is thirty-five years of age or older. A surveyor's blaze struck shoulder-high a hundred years ago will still be shoulder-high today if the tree yet stands. A tree expands in girth with the seasons, but greater height is attained only by new growth at the tree top.

The folding room of the House of Representatives at Washington recently had to dispose of an accumulation of more than a million obsolete and useless publications which members had failed to frank to their constituents. The Senate folding room likewise disposed of nearly 900,000 documents, more than fifty tons of which were sold as waste paper.

The cash value of a college education to its possessor is $72,000, according to a report based on a long study of the earning capacity of college graduates. The cash value of a high school education is placed by the report at $33,000.

Spain's first woman mayor took office recently at Cuatre Tondeta. This appointment is significant inasmuch as Spain has no law giving suffrage to women.

In America and England alone, upward of 10,000 new books are printed every year.

Gulls appeared in flocks of from 4,000 to 5,000 in Pondora County, Montana, and destroyed most of the grasshoppers in that district. Great flocks of the birds preyed on the hoppers in the alfalfa fields immediately after the hay was taken off.

More than five million farms in the United States produce eggs each year.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

Vast deposits of coal in the unexplored wastes of Alaska have recently been discovered by members of the United States Geological Survey.

When an eagle built her nest on the transcontinental telephone line between San Francisco and New York at a point near Elko, Nevada, telephone conversation between the Atlantic and Pacific coasts was stopped and Associated Press wires for a few hours had no service. In the nest were found pieces of wire and automobile parts which caused a short circuit.

Mr. Mark Eben Cheney, of Jamestown, New York, an eighty-four-year-old veteran of the Civil War, literally beat an old Revolutionary War sword carried by his grandfather into a plowshare. He also turned over the blade of an old lancer's spear into a very satisfactory pruning hook.

Thomas A. Edison says that electric light and power transmission by wireless is surely coming in the future but he states there is no cause to believe that it is immediately at hand.

The foreign population of Mexico totals about 600,000 and represents not less than forty different countries.

Spanish feminists are strongly protesting against the refusal of the authorities to grant the request of Senora Reverte to become a matador and try her hand at bull fighting. The authorities deem it a dangerous risk and not fitting for a woman.

When a break occurred in the petrol line of a French airplane, cutting off the supply of fuel, a gallant mechanic crawled out on one of the wings and held the ends of the pipe together for forty-five minutes. He was badly frozen when released but the plane was enabled to land safely. The break occurred while the plane was flying from London to Paris.

Kaibosh, or Kibosh, used in the slang expression, "to put the kaibosh on him," is a Yiddish (German-Jewish) term meaning "eighteen pence." Its use arises from its usually being top-notch price at Jewish auctions in Petticoat Lane, London. "To put the kaibosh on" is to stop the bidding and take the article.

Grain alcohol is now being made from wood waste by a new process.

Joseph Conrad was a native of Poland, his surname being Korzeniowski. He was past middle-age before he found his gift for writing.

The late Dr. George M. Gould, who became one of the famous ophthalmologists of his generation, was forty years old before he took his medical degree.

Charles Willis Thompson is authority for the statement that some of the best stories making fun of William Jennings Bryan's ill success at the polls originated—in private, of course—with William J. himself.

"A Federal law, prohibiting the manufacture and sale of revolvers and pistols, would diminish crime seventy per cent in America," says George M. Dougherty, Deputy Commissioner, New York Police Department.

The United States has an annual murder record for each 100,000 of population, twenty-five times greater than that of Great Britain, and three times larger than that of Italy.

Sixty sororities at the University of Michigan voted on the question of permitting girls to smoke in the sorority houses. Fifty-nine of the sixty voted against the practice.

Charles T. Wrightson recently arrived at Oregon Agriculture College from Fresno, California. He is registered at the Oregon institution as a freshman, is a commercial flier and has conceived the novel idea of bringing his plane to school with him and taking up passengers during his spare time to pay his college expenses.

The Atlantic City division of the Reading Railroad is being equipped with an automatic train control which will make rear-end collisions practically impossible and will bring trains to a stop without any action on the part of the engineer when cars enter the danger zone.

MacDonald and Asquith, speaking into microphones from election platforms, were drowned out by hecklers in the audience. Baldwin went to the office of the radio company where he talked quietly to millions without interruption.

To make the gas cells tight on a dirigible, gold beater's skin must be used. This is made of the large intestines of oxen. A herd of 50,000 is needed to supply the material for one airship the size of the *Los Angeles.*

A five-ton truck, equipped with solid rubber tires, traveling at a rate of fifteen miles an hour, delivers a blow to the road equal to four times its own weight when it hits a depression of only a quarter of an inch in depth.

Denmark has decided to introduce a bill disbanding its army and navy and providing for a constabulary only.

Italy plans to build the largest skyscraper in the world, the Mole Littoria, which will rise eighty-eight stories above Rome, 408 feet higher than the Woolworth Building.

Sheffield plate was discovered by accident in 1742 when a Sheffield mechanic fused silver and copper in making repairs to the handle of a pocket-knife.

Our Fundamental Purpose

The real fundamental purpose of THE DEARBORN INDEPENDENT is to serve as a medium for the dissemination of sound ideas.

This publication does not cater to its readers, but honestly trys to present for discussion those problems which require public attention.

By stimulating thought and discussion among its readers it achieves the main thing necessary to correct existing evils.

Subscriptions will be accepted by any Ford Dealer, or may be mailed direct by means of the accompanying form.

Moscow, Not Tokio, May Control China

Flowery Empire Apparently Crying 'Wolf!' When There Is No Wolf

By HUGH A. STUDDERT KENNEDY

ANYONE who traveled about Europe this summer, concerning himself chiefly with the great world of politics, cannot fail to have been struck with one thing, namely, the brave show put up everywhere by Japan. Whether one was entertained by the Japanese delegation in Geneva, or received in the embassies in Paris or London, one found the same quiet excellence, the same perfect correctness of atmosphere and deportment one has always been accustomed to expect from Japan in the past. Everywhere one gained the impression, from what was said with smiling courteous assurance and from all that appeared, that the great disaster of little more than a year ago was but an incident, and that business in Japan was being carried on "as usual."

Well, the picture is—as it is intended, rather pitifully, to be—strangely deceptive. I remember, a few weeks after the earthquakes and fires of last year, a well-known authority on Japan writing to me out of the ruins of Yokohama to the effect that Japan had been set back on the road of material progress a full quarter of a century. Yet, he added, there is a way out. There is a way in which this great disaster may be turned to good and great account. If only Japan has leaders sufficiently big and sufficiently farseeing to recognize the opportunity now afforded to call a halt in this mad rush toward "civilization" and aggrandizement, and preach the gospel of a slower but surer advancement along the lines of true education and real assimilation, the earthquakes and the fires and the storms of 1923 may yet be seen as blessings in disguise.

That was more than a year ago. What is the situation today? Everywhere one gains the same impression, namely, that during the year that has passed Japan has been doing little else than hitting out blindly at the mist. There has been no serious effort to envisage the extent of the problem. Before me as I write lies a long letter only a few weeks out of Tokio. One paragraph especially seems typical. "Reconstruction," it says, "is spotty and, so far, unplanned. A fire and a high wind will wipe us out again. The few big and somewhat absurd 'skyscrapers' have mostly been put back and are, of course, housing all sorts and conditions of men, optimists or fatalists. Over their entrance the legend should be 'Lest We Forget.' The city, as a whole, is dirty, dusty and squalid."

Why has so little been done? The answer is fatally simple. The shock was apparently so great that the sole effort seems to have been, for weeks and months, to keep up the courage of the people by all manner of optimistic propaganda. Japan could not only stand the blow, but would once again amaze the world by the rapidity of her recovery. Japan was grateful to other nations for their help and offers of help, but, if the worst came to the worst, Japan could stand alone. So the people were fed and soothed on false hope, and the hope has been deferred again and again with inevitable results. Today, the man who held his funds a year or nine months ago, instead of doing as he was tempted to do, transferring them to New York or London, is regretting his optimism. Yet, even today, he does not sit down and take stock and see how he can begin again safely and surely with what he has. He goes to the stock exchange, and plunges into the wild scramble to retrieve his individual fortunes by a lucky throw.

Nowhere perhaps is the jerky, unstable condition of national thought seen more clearly than on the stock exchange. Any rumor is good enough to precipitate a bull or a bear movement. A foreigner in a silk hat stopping by with no more than an idle curiosity to visit the "bear garden" is quite sufficient to boost some stocks a point or two. The exchange, however, is unaffected by such incidents and the average Japanese affects not to see that the yen, which took an upward turn some time ago, is on the downward course again.

Another dangerous symptom is the vastly increasing power and influence of a largely uneducated press. Like shoots from a decaying tree, the ragged sheets are to be found everywhere, and even some of the larger newspapers, in their efforts to retain circulation, are following the lead of the new journalism, "championing" what is known vaguely as "the people," and indorsing the slogan, "Let's Off With the Old and On With the New." The trouble is that while it is easy enough to be off with the old no one seems to know what the new should be or how to assume it. This rapidly increasing element in the population is not yet in power, but the danger of the situation lies in the fact that the people in power are beginning to fear this element of the population, and to allow their policies to be influenced by the new factor.

Yokohama from the bluffs a mass of shacks and temporary buildings.

And now, as if to make confusion worse confounded, there comes the situation in China. In the old days, when a king or government desired to divert attention from a difficult situation at home he stirred up a difficult situation abroad. The danger of the Chinese situation, as far as Japan is concerned, is that it may be used for this purpose. It is true that Japan has learned many bitter lessons from her relations with China during the past few years. It is true that the policy of aggrandizement is largely discredited, that the millions and millions of yen, hardly won war profits, sunk in the great Siberian adventure, are a bitter memory to the great mass of the Japanese people. Still, times have changed and the people with them. A couple of years ago, it might truly have been said that the forward policy in China had no friends; but, today, such is the state of public thought that it would not be difficult to present the old Japanese Monroe Doctrine—the Far East for Far Eastern peoples with Japan in the van—as the panacea for all the troubles of the Japanese people.

The extent of the danger here is greater than appears on the surface. Every month that passes finds Russia a greater potential factor in the Far East than ever before. Those who know Russia best know this above everything, that Russia has not changed to anything like the extent she is supposed to have changed. The old policies of the Czars are still very largely the policies of the Soviet. Russia still moves toward "warm water." The vast army of civil officials and soldiers, who, under the Czars, worked ceaselessly to secure Russia's advance whether toward the Persian Gulf, toward India or toward an ice-free port on the far-off Pacific was not disbanded overnight. It may have changed its name, but the people who had never known any other calling but this calling came back to it, and exploited it with all the tenacity of a French peasant in the days of the World War farming his bit of land behind the lines.

And so today, Russia, eager herself to take advantage of the troubles in China, encouraged thereto by the admitted weakness of Japan, is more than ever on the alert where the Japanese Jingo is concerned. "At the present moment," says my correspondent in Tokio, "Russia is intriguing very successfully in China, and Japan is negotiating most unsuccessfully with Russia in China—not in Japan." And behind Russia, to what extent no one can tell, there is Germany, eager to secure and indeed under an urgent necessity of securing a market for her products. Says the Japanese Jingo, searching round for a remedy and a rallying cry—"If Japan does not do it now, she never will, and she might as well try even if she goes down in the attempt." Once again, it is the old story, the old dream—China with her limitless resources under the control of Japan, the great empire of the future. But today, as twenty years ago, in the days of the Russo-Japanese War, and with more assurance even than then, Russia is determined that nothing of the kind shall be brought about. But that, on the contrary, if China is to be under a tutor that tutor shall draw his credentials from Moscow and not from Tokio.

It is curious how little is heard of it all or thought of it all here in the United States or in Europe. The attention of the world has been for so long so centered in Europe that even the actual explosion now manifesting itself in China seems no more than the cry of "Wolf! Wolf!" when there is no wolf. What is happening in China may be no more than a repetition of what has happened there again and again in the last half century. But the circumstances are different. The charge of powder which flares up harmlessly in the open will work far-reaching havoc when confined within limits.

The most serious of these "confining limits" where China is concerned is Japan; Japan, nervous, dangerously out of control, not a little baffled. The government is honestly striving to secure and maintain a level of national sanity, but against the Jingo element, against "the devil on the high mountain," as the Japanese peasant has it, the government is only holding its ground with difficulty. The next few months ought to be decisive. If the Jingoes win, and Japan "wades into China," as she is being urged to do, then it is safe to say that the Far Eastern sky will suddenly be illumined with such a blaze as will cause the smoldering embers of Europe to be—temporarily at any rate—forgotten.

It is to be hoped, however, that this calamity may be averted, and that China may have the foresight to work out her own salvation without the intervention of her old enemy or any other foreign power.

What Is the Wittiest Saying?

By W. P. CROZIER

WE ARE sometimes invited by our friends or our newspapers to make a list of the ten most famous men of our own or any other country and time, or of the ten best books published during this present century, and to place the names in order of preference. But there is a form of competition which I think would be as exciting and amusing as any other, and that would be to say what in our opinion are the wittiest sayings and repartees ever attributed on good authority to men of note, living and dead.

There are many published collections of such sayings, like those of Mark Lemon and Walter Jerrold, to mention only two, and anyone who wishes may add to them from his own store. For myself, of all those witty sayings (on the eastern side of the Atlantic) which I have ever read and noted down, I choose six that I think sparkle above all the rest; and I have an order of preference for them, though others may disagree. They shall see.

But first, about wit. What is a witty saying? We must rule out the mere pun and verbal smartness. A saying is witty, let us say, when the author takes a word or a phrase—often a very homely one—and applies it to a given set of circumstances in such a way as unexpectedly and with manifest point to link up two dissimilars. And often, the greater the natural incongruity of the two sides of the comparison, the more brilliant is the stroke of wit.

Let us take an example, though this is not one of my six best:

When Sheridan had once drunk too well at night, he was found by a watchman helpless in the gutter. The watchman demanded his name and, obtaining no answer, shook him roughly and demanded it again. At last Sheridan, opening his eyes, replied in slow and solemn tones—"Wilberforce!" The identification of the prelate whose name was a synonym of moral earnestness with the broken-down toper in the hands of the watch—and by himself—was a master stroke of wit.

There is one other story which many people would think should come within the best six, though it is more in the nature of a verbal play, and therefore I will only mention it by way of prelude. Theodore Hook and a friend were one day walking in the country when they passed a public house whose owners, somewhat deficient in the art of spelling, had placed on their signboard the words: "Bear sold here." "Ah," said Hook, "their own bruin, I suppose."

Now for the six, and any who likes may quarrel with the order in which they are arranged. I work upward from the bottom; each succeeding repartee is, in my view, better than those that go before, having regard to all the circumstances under which it was uttered at the time.

A story about Richard Brinsley Sheridan is the one I place sixth best. Sheridan was often and notoriously in debt, and lived on credit. On one occasion he had moved into a new house and soon afterward met a friend, Lord Guildford.

"Well," said Lord Guildford, "and how is the new house getting on?"

"Fine," was the answer. "Everything goes like clockwork."

"Ah!" said Lord Guildford, "Tick, tick, tick, I suppose!"

The story which I place fifth best is one where the point depends on the exact circumstances under which the repartee was made.

Charles James Fox had attacked the quality of the gunpowder supplied to troops by the government of the day so violently that Adams, the Secretary of War, took it as a personal insult. He challenged Fox to a duel and the combat took place. Fox fired in the air; Adams shot Fox but inflicted only a flesh wound. Fox made his way across the ground and, as the pair shook hands, honor being satisfied, he remarked, "You know, Adams, that would have killed me if you hadn't used government powder!"

It would surely take a lot to beat Fox's droll idea of making the very duel and his own escape from death an opportunity for whimsically repeating the precise insult for which the combat had been fought.

This, the only modern example included in the six, is attributed to Charles Whibley, the English historian and essayist. He and a Cambridge don, it is said, had made an extended tour together in foreign parts. The don had a weakness for "drawing the long bow"; his experiences losing nothing in the telling. On their return he was recounting the story of the tour to the senior common room of the college, Mr. Whibley being present. At last one of the stories was so "tall" that the audience did not conceal its skepticism.

"Oh," said the don, protesting, "but my young friend Whibley was there and he will bear me out."

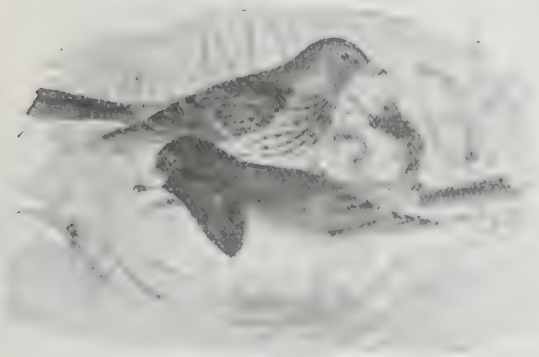
"Yes," said Whibley, "but it is recorded that the young men bore Ananias out."

(Concluded on page 14)

Migrant's Non-Stop Flight of 2,400 Miles

Bird Beats Airplane in the Economizing of Its Fuel Supply

By JOHN M. ROBERTSON

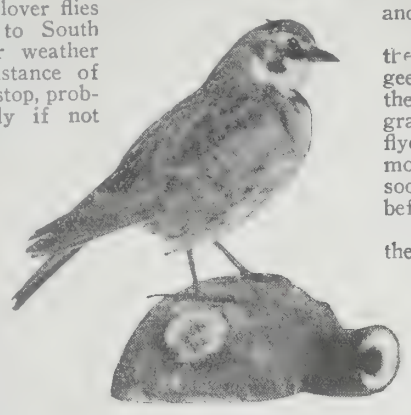


Junco, adult and young.

Pine Grosbeak; Rose-breasted Grosbeak; Towlue; Indigo Bunting.

MAN boasts of having conquered the air, but the airplane seems a crude, inefficient thing when its performance is compared with the regular flights of migratory birds.

The humming bird, smallest of all birds, crosses the Gulf of Mexico, flying more than 500 miles, in a single night. The golden plover flies from Nova Scotia to South America and in fair weather makes the whole distance of 2,400 miles without a stop, probably requiring nearly if not quite forty-eight hours for the trip.



Horned Lark.

Here is an aerial machine that is far more economical of fuel—that is, of energy—than the best airplane yet invented. The to-and-fro motion of the bird's wings appear to be an uneconomical way of applying power, since all the force required to bring the wing forward for the beginning of the stroke is not only wasted, but more than wasted, as it largely increases the air friction and retards the speed. On the other hand, the screw propeller of the airplane has no lost motion. Yet less than two ounces of fuel in the shape of body fat suffices to force the bird at a high rate of speed over that 2,400-mile course.

The routes and habits of the migratory birds of this continent are a fascinating field for research and many mysteries still remain to be solved. No one knows, for instance, where the chimney swift spends his five-months' winter vacation. The 11,000-mile track of the arctic tern has never been indicated.

Canada and the United States through their migratory bird treaty now protect these valuable game and insect destroying birds from the barbarous slaughter that formerly prevailed. The enforcement of the treaty in this country by the Biological Survey has enabled many species of birds that seemed to be doomed to follow the carrier pigeon to extinction to show gratifying signs of recuperation.

There is considerable agitation for a migratory bird treaty with Mexico. Throughout the valley of Mexico there are scores of shallow lakes where every variety of duck that summers in the United States and Canada can be found in the winter. The Mexican Indians are killing these birds in needless numbers by discharging fixed batteries, termed "armadas," of as many as two hundred old shotguns at these feeding birds at one time. Two thousand ducks have been shot down in a single discharge of the great "armada" at Penon Viejo, near the capital.

The land bird with the longest migratory route is probably the nighthawk which flies north to Yukon and south to Argentina, 7,000 miles away. The blackpoll warblers that nest in Alaska winter in Northern South America, at least 5,000 miles away. The scarlet tanager migrates from Canada to Peru and the bobolink that nests in New England winters in Brazil.

However, the water birds and especially the shore bird group cover the longest migration routes. Nineteen species of shore birds breed north of the Arctic Circle, every one of which visits South America in winter, six of them penetrating to Patagonia, a migration route more than 8,000 miles in length.

The arctic tern is the champion migrant. It breeds as far north as it can find land on which to build its nest and winters as far south as there is open water to furnish it food. A distance of at least 11,000 miles intervenes, the round trip exceeding 22,000 miles.

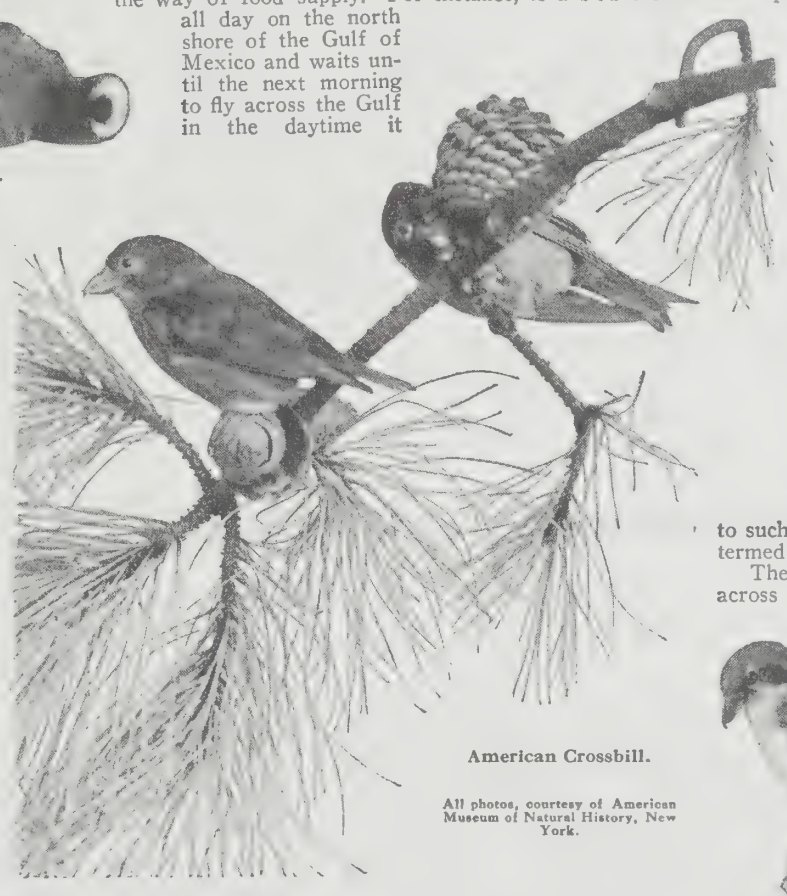
There are two theories to account for the cause of the migratory habits of birds. The more commonly accepted one is that ages ago the bird life of Canada and the United States was non-migratory. The formation of the habit of migration took place at the same time that changing seasons of the year replaced the continuous semi-tropical conditions of the pre-glacial eras.

According to the opposite migration theory, the birds' real home is the Southland; all bird life tends by overproduction to overcrowding; and, at the end of the glacial era the birds, seeking in all directions for suitable breeding grounds with less competition gradually worked northward as the retreat of the ice sheet made habitable vast regions of virgin territory. But the winter abiding place was still the home and to this they returned as soon as the breeding season was over.

The beginnings of migration ages ago undoubtedly were intimately connected with periodic changes in the food supply. While North America possesses enormous summer supplies of bird food, the birds must return south for the winter or perish. No such movement occurs toward southern latitudes because they are bleak and devoid of sources of bird food.

Some birds migrate by day, but most of them make their flights by night. Day migrants include ducks and geese (which also migrate by night), hawks, swallows, the nighthawk and the chimney swift. The night migrants include the great family of warblers, the thrushes, flycatchers, vireos, orioles, tanagers, shore birds and most of the sparrows. They usually begin their flight soon after dark and end it before dawn and go farther before than after midnight.

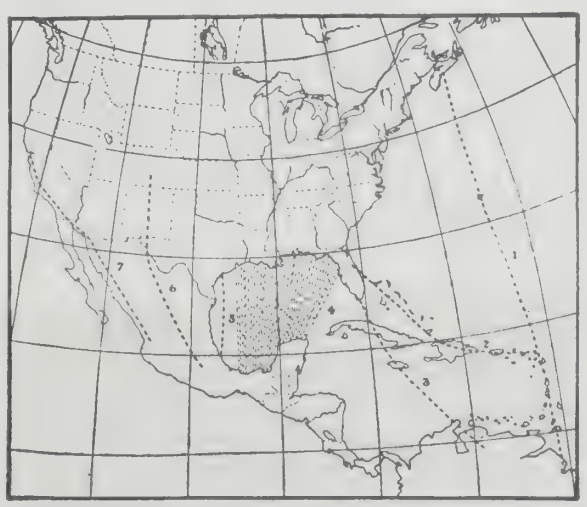
Birds that journey by night make a decided gain in the way of food supply. For instance, if a bird feeds all day on the north shore of the Gulf of Mexico and waits until the next morning to fly across the Gulf in the daytime it would arrive on the Mexican coast at nightfall and would have to wait until the following morning to seek food. Thus there would be thirty-six consecutive hours without food whereas by night flight the same journey can be performed with only a twelve-hour fast.



American Crossbill.

All photos, courtesy of American Museum of Natural History, New York.

The two areas of abundant food supply are North America and Northern South America, separated by the comparatively small land areas of Mexico and Central America, the West Indies and the great waste stretches of water. The different courses taken by the birds to get around or over this intervening region are almost as numerous as the bird families that traverse them, but there are several outstanding routes.



Principal migration routes of North America. Most migrants use route No. 4, though this necessitates a flight of 500 to 700 miles across the Gulf of Mexico. A few traverse the more direct route No. 3, and still fewer, route No. 2. Only water birds make the 2,400-mile flight along route No. 1, from Nova Scotia to South America

Birds often seem eccentric in choice of route and many do not take the shortest line. The fifty species from New England that winter in South America instead of making the direct trip over the Atlantic, a flight of 2,000 miles, follow the coast to Florida and take a somewhat longer route by island or mainland to South America.

What would at first sight seem to be a natural and convenient route extends from Florida through the Bahamas or Cuba to Haiti, Porto Rico and the Lesser Antilles to South America (see No. 2 on map). The birds would never be out of sight of land; there are resting places at brief intervals and the distance is but little longer than the water route.

However, the island-to-island route through the West Indies is but little used beyond Cuba. About twenty-five species continue as far as Porto Rico and spend the winter there, and but six species reach South America by completing the island chain. The reason is the scarcity of food upon the small islands. The total bird movement is enormous and beyond the feeding capacity of this route.

A more direct route requiring longer single flights stretches from Florida to South America via Cuba and Jamaica (No. 2 on map). About sixty species cross from Florida to Cuba, half as many species take the next flight of ninety miles to Jamaica. Here a 500-mile reach of open ocean intervenes between South America and scarcely one-third the number plunge ahead.

Chief among the birds that make the 500-mile flight from Jamaica to South America is the bobolink who winters in Southern Brazil. The bobolinks' traveling companions are the vireo, kingbird and nighthawk that summer in Florida; cuckoos from New England, thrushes from Quebec; the bank swallow from Labrador and the blackpoll warbler from Alaska. However, the bobolink outnumbers all the rest to such an extent that this passage may appropriately be termed the "bobolink route."

The main route of the migratory birds is straight across the Gulf of Mexico (No. 4 on map). A larger or smaller percentage of nearly all the species bound for South America take this course, regardless of the long flight across the Gulf. Millions of birds cross at the widest part necessitating a single flight of from 500 to 700 miles. To the westward a short water route (No. 5 on map) is used by some warblers and a few other species.

Northern Shrike.

Still farther west are two routes (Nos. 5 and 6 on map), which represent the land journeys of those birds from Western United States that winter in Mexico and Central America.

Route No. 1 on the map is a thousand miles shorter than the main migration avenues; but it is not employed by any land bird. Nevertheless it is a favorite south-bound route for water birds, especially the golden plover.

In the first week of June the golden plover arrive at their breeding grounds on the "barren grounds" in Canada, above the Arctic Circle, far beyond the tree line. As soon as the young are old enough to care for themselves, autumn migration is begun by an eastward trip to the Labrador coast where several weeks are spent feeding upon the native fruits. Then a short trip across the Gulf of St. Lawrence brings them to Nova Scotia, the starting point for the 2,400-mile flight to the coast of South America. The overland journey there takes them to the pampas of Argentina where they remain from September to March, the summer of the Southern Hemisphere.

After a six-months' vacation in the Argentine the golden plover return to the Arctic by an entirely different route. They cross Northwestern South America and the Gulf of Mexico and move slowly up the Mississippi Valley and by early June are again at the nesting ground.

The golden plover of the Pacific fly from Alaska to the Hawaiian Islands, about 2,000 miles, where they spend the winter.

The Connecticut warbler also has different routes for its southward and northward journeys. It winters in South America, going and coming across the West Indies. North of Florida the spring and autumn routes diverge. The spring route leads the birds up the Mis-

What Are a Man's Chances on a Newspaper?

How High Do Salaries Go?—How Are Policies Made?—Are Writers Free Or Forced?—Mr. Hearst's Experiments With "Public Taste"

By THOMAS L. MASSON

Mr. Masson began his discussion of newspapers in the issue of October 18.

IN A previous article I took up the question of the enormous amount of reading matter furnished by the newspapers, the impossibility of reading it and the appalling waste as a result. In the present article I shall deal with the salaries of newspapermen, whether journalism can be considered a true profession, the editorial page, and some matters of history.

In the old days, there was only one way of entering journalism, and that was to become a reporter on a newspaper. Reporters who started on the old New York *Sun* under Mr. Dana—after they had passed the preliminary test for education, and so on—were paid fifteen dollars a week. Later, if they made good, they were put on space, which means that they were paid at the rate of eight dollars a column (on some papers much lower than this, running down to $5 and $3) and it was possible for a bright reporter to make regularly about $100 a week. Several men who afterward became famous got their preliminary training in this way—among others, Irvin Cobb, Frank Ward O'Malley, Dana Burnet, Will Irwin. This system in a general way is now in vogue. But at present the numerous schools of journalism in colleges and universities enable young men to acquire a certain amount of training beforehand. Even under these conditions, however, the way is not easy. I can name at least half a dozen young men who during the past two years have been graduated from these schools and have failed to "connect" on newspapers. Salaries are now higher, but $100 a week is high. A typical instance will suffice.

Some years ago a very bright young fellow, a writer so good that he had accompanied the Prince of Wales on his first visit to this country, having received an assignment to write up the tour, was laid off after the Prince went back, and applied to me for advice. I told him to watch the news items carefully and when anything struck him of special interest, to go out after it and write it up as a special for the Sunday issues. It happened that the following week a friend of mine, who was an American Legion man, called my attention to a certain hospital which, during the war, had been the scene of great activity, but now had been forgotten by the public. My friend said that the women had almost utterly neglected it. I called up the young man in question, he visited the hospital and the following Sunday had a page in one of the leading New York papers, with pictures, showing how the disabled soldiers had been neglected. The article created a sensation and through it this young man was able to secure a regular staff position. He was given charge of one of the departments, and now receives a salary of $115 a week. I should say, roughly, that a good reporter on a big city newspaper will draw from $75 to $150 a week. Also it must be remembered that his work gives him opportunities to write articles for periodicals, so that he may actually be able to earn about $10,000 a year. This for reporters is the high-water mark, except in special cases.

Some of the men on the big metropolitan papers who conduct columns get much more than this. One who has acquired a national reputation receives $300 a week. His total income is perhaps $400 a week. If a man is fortunate enough to get an idea that can be syndicated he may make much more than this. Thus a few humorists make large amounts. But these are outside strict newspaper work.

As a rule editorial writers are paid less. Two years ago I made an arrangement with a leading New York paper to write one editorial a day. Their ordinary rate was $5 an editorial and they considered it quite generous to offer me $7.50. Later another paper paid me $125 a week for an editorial a day. Arthur Brisbane, who writes a column of short editorials a day for the Hearst papers, six days in the week, receives, on credible information, $4,000 a week, and is probably the highest-paid editorial writer in the world. I doubt very much whether any man who is in charge of the editorial pages of any large daily paper receives more than $500 a week.

In the small-town papers, that is, in cities of, say, 40,000 or 50,000, the man in charge of the editorial page—and who is generally expected to write all the editorials—will receive from $50 to $75 a week. Most of these writers, all over the country, are looking forward to the time when they may get on some of the big city papers.

About Editorial Writers

FRANK COBB, one of America's greatest editorial writers, who conducted the editorial page of the New York *World*, was such a man. Joseph Pulitzer was dissatisfied with the editorial page of the *World* so he ordered that the editorial page in every paper in the country of any importance be studied for six months and from the data received the best man should be selected. Frank Cobb was the result.

So far as the staff editorial writers on big papers are concerned, it is probable that the best of them do not get more than $250 a week and this is exceptional, the salaries ranging from $75 to $150. One man whom I consider one of the best editorial writers in the country, on the staff of one of the largest papers, told me that in his lifetime he had not been able to save $3,000 and that he could not wait over one week without his pay envelope. He was not extravagant. Another, also one of the best writers in the country, a man who had written books which are likely to live longer than most books, receives, I am informed, the top price of $250 a week. For this he writes one editorial a day, one special Sunday article and, besides this, is called upon constantly to supply a running mass of material for certain departments. He works continuously and has two weeks vacation or possibly three. He has a family and shows the strain of caring for them. It must be remembered that while this seems a high salary, a position like this is expensive to maintain. He is forced not only to buy certain books not obtainable for purposes of review but to keep in touch with many kinds of people and to go about as much as possible.

Most editorial writers are forced to submerge their personalities, and to write only those things which conform to the general editorial policy of the paper, which is always indicated, usually indirectly, by the owner. I once wrote an editorial satirizing the shameless and vulgar ostentation of certain society people. It slipped into the paper, and I was admonished by the man in charge of the editorial page never to do that again, as the wife of the owner of the paper "belonged."

As a rule, the ability which makes a great editorial writer is not coupled with the money-making faculty. The result is that the two functions are divorced, and the owner is obliged to hire his thinking done for him. Thus an editorial writer is both trammeled and untrammeled. He has no formal restrictions placed upon him, and certainly nothing as far as advertisers are concerned. On the other hand, his opinions may or may not be his own, in accordance with the fear he has of losing his job, or how closely he agrees with the owner. One editorial writer expressed it to me in this way: "I never can get the right 'punch' into my editorials, because I have first to be sure that they are absolutely correct in formal statements. The possibility of making a mistake has grown upon me so that it has taken away from my sense of freedom." Most editorial writers, by a process which seems inevitable, are reduced to the level of shipping clerks, whose chief concern is to get labels correct.

This in general is the real reason why all editorial newspaper pages have no influence with the public and are read by only a very small proportion of readers. Exceptions to this rule lie, however, among those writers who write on special topics, as literature, art and drama, and also sport. All these subjects are outside of the pale of the newspaper owner, who knows or cares little about them, so that these special editorial writers often deliver charming essays, notable for their insight and learning. But in politics, religion and finance, editorials merely reflect the opinion of the management, shifted through paid minds.

* * *

As for the news, extraordinary pains are taken to make it what is called accurate, but here again the question of what is accurate and what is not, is always debatable. An illustration will suffice.

Fearlessly Tilting at Abuses

SOME time ago I was present at a newspaper editorial conference where this matter came up. A certain banker, who had acquired a large fortune and had retired, had broken loose, and in a public speech gave away a lot of inside information which concerned itself with the administration at Washington. This banker, whether mistakenly or not, was obsessed with the ambition to help his country out of what he regarded a quagmire of corruption. What he said in his speech had not only been common talk for weeks, it was known to be true in a general way—in fact, it was one of those things which, grounded in human weakness, were obviously true—yet the only question to be determined was whether it could be proved. In any case of corruption, to get the actual evidence is practically impossible. Newspapers then avoid all "attacks" even when the hearsay evidence is very close to the truth. Take the Teapot Dome scandal and all the other similar political scandals which stretch back like a poisonous line of history, and it will be seen that their final exposure has depended upon a long course of treatment. After the exposure has been made and the truth comes out, everybody wonders why it wasn't done before. The reason lies in the fact that newspapers are commercial enterprises, automatic in their action and must safeguard their utterances. They cannot supply truth; they merely record what is going on, according to conditions. If it is hearsay it is camouflaged, the word "alleged" being a stock word used for purposes of defense against possible libel. Occasionally some fearless newspaper writer or editor takes it upon himself to run the gauntlet and expose certain abuses, for the power of any single individual, when he is right, is still supreme. But these exposures are exceptional.

Breaking into the newspaper game for any young man is a very difficult process, and even if he has unusual talent, to establish oneself takes years of very hard work. I advise all beginning young men, assuming they have the necessary education (which may have included a course in some school of journalism) to begin as reporters, and to be knocked about as much as possible. This is very valuable as a background. It is absolutely essential to become a student, and by this I mean to study constantly the best models. Most of the really good writers are constant students of the Bible and Shakespeare. Political writers usually make a study of Burke and Bagehot, as a background. A good practical knowledge of American history is a most valuable asset. These two things: the first-hand contact with human nature through the reporter's job, and the purifying of one's style by going back to the sources of literature, form the necessary foundation for an enlarged success. The list of our biggest men—ambassadors, statesmen, and so on, who have acquired their preliminary training in the field of journalism—is a long one. Also, it is becoming more and more the custom among the greatest newspaper proprietors to hire men of liberal educations—that is to say, scholars—and send them out as world reporters. This is a very important advance. Thus we see men of very large attainments traveling about the world and writing up their reflections for their papers, a large part of this material being cabled at enormous expense.

The question so often discussed, whether journalism is really a profession or not, is thus answered. It is a profession if one wishes to make it so, and by individual force and persistence, coupled with the student habit, it is always possible for any individual to make himself a power, that is to say, to become a law unto himself. This result is always achieved by honesty of purpose, absolute sincerity and a passion for truth as nearly as it can be told.

Among prominent writers who have begun their careers in the newspapers may be mentioned Joel Chandler Harris' "Uncle Remus" (Atlanta *Constitution*), Rudyard Kipling (started as a syndicate writer), Drake's "American Flag" (New York *Evening Post*), Holmes' "Old Ironsides" (Boston *Advertiser*), James Russell Lowell's "Bigelow Papers" (first published in newspapers), Eugene Field (Chicago *News*), George Ade's "Fables," and so on.

On the other hand, owing to the huge mechanical expense of production, coupled with the dependence upon large volumes of advertising, all newspaper proprietors are forced to regard their enterprises as commercially relentless, and therefore severely automatic in their working. There is no objection to this, provided the newspaper is conducted honestly and backed by sincerity. But it is unfortunately true that the worst elements in human nature are coldly classified as a necessary asset. Sex and crime are thus played up, and "features" are more important than straight news. When Mr. Hearst first started his Boston paper, he was unable to secure a news service at the stated time. It was finally determined not to wait until arrangements for this had been perfected, and the paper was issued with only the features—comics, stories, and so on. To their amazement the circulation of the paper reached nearly two hundred thousand copies a day within a very short period—I think less than a month. This object lesson supplied Mr. Hearst with the idea he has since carried out, namely, to subordinate the straight news to the special features. It thus became more important, from Mr. Heart's standpoint, to do his bit in lowering the standard of public taste (already nothing to brag of) by playing up false emotionalism and morbid vulgarities. Similarly, this astute newspaper publisher made up his mind that he could get the public to pay ten cents for his New York Sunday issue then being sold for five. He approached other newspaper proprietors endeavoring to get them to raise the price. But they were afraid to do so as a possible drop in circulation would seriously affect their advertising rates. Mr. Hearst thereupon took a certain district near New York, and had a special rate of ten cents printed on the Sunday papers in that district. He was thus able to try out his experiment on a small scale. Discovering that the doubled price had no appreciable effect on his circulation in this district, he immediately charged ten cents for his Sunday paper everywhere. As soon as this rate was established, he then proceeded to try out another district at the fifteen cent rate. This experiment I believe is still going on.

It will be seen from what I have written that the original object of newspapers, which was merely to supply to everyone necessary information, has been subverted and has now become a vast, unwieldy machine, or kind of typographical Moloch, which threatens to swallow up everybody in its maw.

Probably the first newspaper issued was issued by Julius Caesar, in old Rome, whose "Daily Acts" was a kind of bulletin for the information of Roman citizens. The term "newspaper" was first used in 1670 by Charles Perrot in a letter to a friend. In England, Thomas Archer established the first newspaper in 1622, entitled, *The Weekly Newes*. Perhaps the most ideal newspaper in the world is one that not only contains no advertisements, but isn't even printed. It is merely a custom introduced by the inhabitants of the Swiss village of Champney, but I understand is still going on. On Sunday immediately after church, the citizens assemble and the town crier issues the news of the day. His announcements in matters of record are legal by ordinance.

How Northcliffe "Received"

IN THIS country, the newspapers were first preceded by what was termed a broadside, which was in effect a kind of special article on a subject of importance. After this came showers of individual pamphlets, among which the writings of Tom Paine and Alexander Hamilton (*The Federalist*) are the most important. It is probable that without *The Federalist* the American Constitution would never have been adopted by New York State.

The first newspaper in Boston was the Boston *News-Letter*, April 24, 1704, issued by John Campbell. In Philadelphia the first paper was *The American Weekly Mercury*, issued December 22, 1719, and the first daily appeared in that city on Tuesday, September 21, 1784. After this came the New York *Daily Advertiser*, March, 1785. The New York *Times* was started in 1851, and Charles A. Dana purchased the New York *Sun* as a personal organ for $175,000 on January 25, 1868. It is said that the first issue of the New York *Herald* by the elder James Gordon Bennett was published in a cellar in Wall Street and started "with $500, two wooden chairs and an

Old Book Store in the Heart of Quaker City

Famous Browsing Ground for All Sorts and Conditions of Readers

By WILLIAM A. M'GARRY

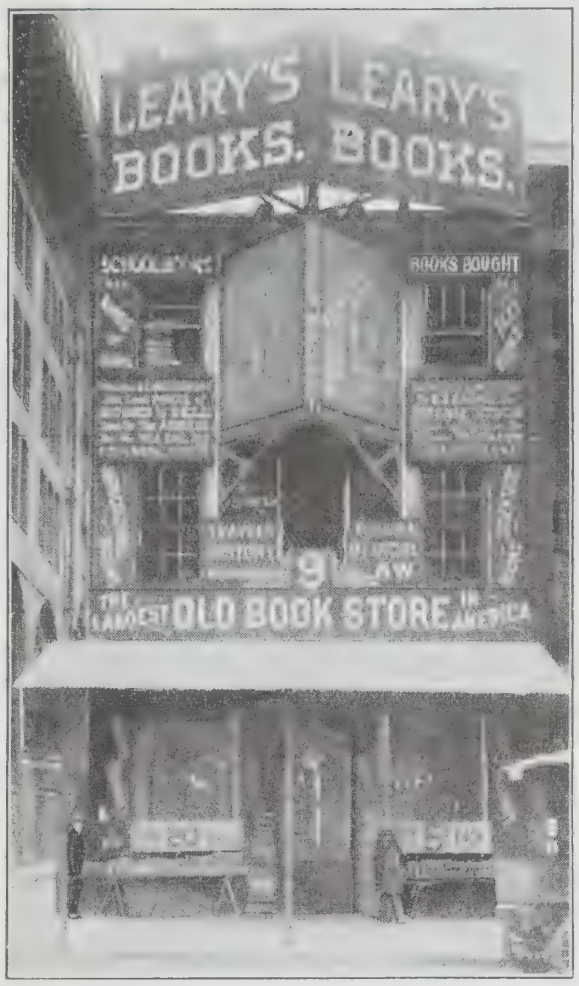
BOOK lovers of all ages in every corner of the world, as well as others who decry the heedless pace of modern life that leaves so little time for thought and tends to stamp out historic landmarks, will be interested and perhaps elated at an item of news from Philadelphia. In the sense that the word is used by newspapers the information is not news because it is "negative"—but millions of readers of all living generations will not see it in that light. The story is simply that Leary's Old Book Store, the largest in the world, is to continue doing business at its old stand.

Months ago the commercial and trade journals all over the country carried the information that an already huge department store intended to build an addition south in Ninth street from its present structure. Probably not more than one reader in a thousand of this item in its various forms was aware that if this addition were built as planned it would obliterate Leary's. But since then the heads of the firm have been deluged with a steady stream of letters from reading and writing men, teachers, philosophers, scientists, technical men, and just plain workers asking if the famous old bookstore intended to move or had sold out.

Now it may be announced that Leary's is not to be swallowed up or changed in any way by the encroachments of commerce. The new building is to go up around it, but the old-fashioned three-story brick structure with its quaint awning and its famous sign of the "bookworm" is to remain just as it has been for more than half a century. A fabulous price was offered for the narrow plot of ground on which the bookstore stands—a price that would have equaled the profits of two years. It was rejected because the owners who have grown old with the books of the world thought more of tradition and the good will of their clients than of immediate profits.

Leary's was founded eighty-eight years ago when William A. Leary arrived in Philadelphia from Maryland and began to sell used books from a basket in what was then the business center, along Second street. Since then its patrons have numbered virtually every famous statesman and man of letters in this country and many from abroad. It is and has been for years the first place to be sought out by literary celebrities visiting Philadelphia. World travelers go there, and keep in touch with the old place wherever they may be. But the real backbone of its patronage both in its own city and in the mail-order end of the business is among people of small means who buy used books because that is the only kind they can afford.

In that sense this old bookstore might be likened to a university—and what an institution it is. Half a million books are on its shelves or in its warehouses—or rather in constant circulation through them. The sales frequently run into two or three million books a year, so widespread is the demand. In these books is all the knowledge of the ages, for the stock is not confined to mere popular reading. It includes every branch of science and technology, all the philosophies, history, art, travel and biography as well as fiction. In recent years, with the great increase of the foreign-born element in the population, there has been a corresponding growth in demand for books in French, Italian, Spanish and other languages, and large departments are maintained for the distribution of these volumes.



The landmark of used books—Leary's, in Philadelphia.

The store looks more like a library than a place of business. Outwardly it has the appearance of the old bookstore of fifty and seventy-five years ago, with the volumes arranged on broad tables or in bins. Inside there are a few more tables for special displays, and then the stacks, reaching to the ceiling, with aisles between just wide enough for two rows of book lovers to browse. These aisles are nearly always comfortably occupied. Here the student working his way through college rubs well-worn elbows with the statesman, the professional man and often the multi-millionaire collector.

In that connection Leary's has some interesting bits of booklore to offer. There have been periods in its history when book collectors made up the bulk of its customers. For some years after it became the fashion for rich men to make collections of rare books the shelves of the old bookstore were the mecca of treasure hunters. More often, however, the "find" was to be made on the outside tables under the awnings, or in the outdoor shelves that run along the side of the old building where it is flanked by a narrow court. Here, in a helter-skelter collection of volumes selling at five, ten or fifteen cents each, prizes have been picked up worth hundreds of dollars at the time and now worth thousands.

Simon Gratz, of Philadelphia, bought from these counters one day a packet of yellowing pamphlets, most of them relating to Indian wars and similar minor events of early American history. Today these little early imprints bring from two hundred to five hundred dollars each. The reason is that it has become almost impossible to buy them, since nearly all have found their way into the libraries of the historical societies and of wealthy collectors. Although Leary's is constantly buying libraries, to keep its shelves supplied, rare books are appearing less and less in the incoming flow. For a time the store maintained a rare-book department. That has now been replaced by the department of scarce books.

To the outsider this may sound like very much the same thing, but it isn't. According to Edwin S. Stuart, former governor of Pennsylvania, who has owned the store nearly half a century, "scarce books include thousands of titles, and the number is increasing daily." A scarce book is simply one that has never been sought by the collectors, but is in great demand by actual readers. The price of it as a rule is still considerably below the original publishing price. In spite of the demand, such books come back again and again to the market. Sometimes the store has had as many as a hundred names on the waiting list for a particular book, and all of them may be supplied within three to six months. Nine out of ten buyers of old books are also sellers of books. They bring back the volumes when they have finished reading them, to get funds to buy more.

The old bookstore thus has been the means of furnishing library facilities to thousands of poor students, men and women. It is able to supply at low cost facilities that cannot be had from the libraries. This is particularly true of textbooks. A student may need one for an entire term at a night school. Schoolbooks of all kinds comprise one of the largest departments in the store. Here may be found the young men and women—and often older ones—who cannot find time for regular school courses, seeking the means to self-education.

The quaint outdoor stalls on the side court of Leary's Old Book Store.

The late William A. Leary founded the business in 1836, as stated above, selling books from a basket. He had so much success that in a short time he was able to rent a store. His son, William A. Leary, Jr., succeeded to the business in 1865, and in 1868 the store was moved to the southeast corner of Fifth and Walnut streets. During the Civil War that was the center of Philadelphia professional and legal life. The courts and banks were all in the vicinity. It was across the street from Independence Hall. In that location the demand for old books increased until Mr. Leary found it necessary to hire an errand and delivery boy.

Edwin S. Stuart, then fourteen, answered his advertisement. The man who was later to become mayor of Philadelphia, governor of Pennsylvania and for a time a national figure in politics, delivered books in a little wheelbarrow. Within three years, so deep was his interest in books, he knew more about the business than its owner. At the close of the Civil War, Mr. Stuart was left in charge as manager of the business when Leary's failing health forced him to retire. When the younger Leary died in 1874 Stuart was continued as manager, and in 1876 he bought out the interest of the Learys, but has held to the old name ever since.

It was about this time that Leary's adopted its world-famous trade-mark—the highly colored picture of a book lover perched more or less perilously atop a ladder before a case of books. One volume is held close to his eyes as he examines its pages. One is held open and ready for examination in his other hand. There are books under his arms, between his knees and all about him. The original was painted by an artist of Dusseldorf. Mr. Stuart had a huge copy made on wood and hung the sign in front of the store, adopting it as the trade-mark.

In the last fifty years that sign has been repainted every year, but it still hangs before the third-floor window of Leary's. It is the store's single advertisement. The same picture was used by Sir Walter Scott in "Guy Mannering." When Leary's was moved, to keep pace with the shift of the city's center, to its present Ninth street address, opposite the post office, the sign went along. All sorts of proposals have been made to replace it with electric signs and other transparencies, but it has never been changed except for the annual coat of new paint.

"When I went into the book business as a boy," says Mr. Stuart, "every city and town had numbers of small stalls, generally outdoors, in which books were sold Most of them did a large business in the so-called 'dime novels' and 'penny thrillers.' Today these have almost disappeared. It was customary three-quarters of a century ago to sell old books from door to door or from office to office. The change that has taken place is the best possible indication of the changed reading habits of the people.

"Every year the demand for old books increases, much faster than the increase in population. This is so in spite of the growth of magazine publishing. Not so many years ago the magazine editors worried about the saturation point when a million buyers had been reached. Today it is estimated that more than twenty million persons buy magazines every month. This current reading stimulates rather than decreases the demand for more solid material. We get hundreds of inquiries from persons who have read an allusion to a novel or a poem or a biography in a magazine article. Finding the right book is relatively easy to men trained in the business."

It was under the direction of Mr. Stuart that the largest old bookstore extended its operations to foreign fields. For many years one of its side lines has been the preparation of hand-bound books. Editions of popular and lasting American works are bought up and sent abroad to be bound. Agents of the firm in all the great cities of the world are constantly on the lookout for libraries. And in that connection it is interesting to note that the advertising of the firm always has been as a buyer of books. This is necessary to supply the demand.

A development of unusual interest in the business in recent years has been the virtual abandonment of "trashy" fiction. Buyers of used books, the majority of whom have little to spend and must get the utmost in value, rarely call for books of this character. There is a steady call for the great classics, not only in sets but for individual volumes. History also is always in great demand.

A tradition in this old bookstore is that the visitor shall never be urged to buy. In fact, a sign conspicuously posted on all the stacks informs the reader that the attendants are under strict orders not to offer assistance or advice unless asked for it. As a consequence one may browse for hours among all the literature of the world without interference.

Up the Yangtze on a Dead Man's Chest

American Woman Refugee Has Weird War Adventure on a Chinese River

By MRS. L. M. CRAMER

FIVE weeks and one day after we fled from Soochow and the expected war, in the beginning of September, and had taken refuge in Shanghai, we returned to our homes—the little bride from Alabama and I—and the bridegroom came for us.

One of the ironies of this war—to us—has been that never but once in all these five weeks has the sound of guns been heard in Soochow, while in Shanghai, where we went for safety, we heard them every day when there was fighting, and several times the fighting came to within five miles of the city limits.

And when we did come home, we came literally sitting on a dead man's chest.

The husband of the Alabama bride came to Shanghai on business. In part that business was to buy food for the foreigners back in Soochow, whose stores were getting low. He could take back what he could carry, but to get to Shanghai he had to go to Chingkiang, a city 150 miles up the Yangtze River from Shanghai, and thence down on a big river boat. Three days it took instead of about two hours as in the pre-war days when one hopped into a very modern train, read his morning paper, and arrived in Shanghai about the time he had exhausted the news of the day.

It was a hard trip, but we concluded if "Jack" could take it, we could, too, and we did. We were sure that the danger from looting in Soochow would be no greater than the danger from a stray shell in Shanghai. Also, there was talk that if the Kiangsu troops were about to take the city, Chekiang would sell that last few feet dearly, and that she would touch off the dynamite magazine just before she surrendered. That dynamite magazine had been the cause of more sleepless nights in Shanghai than any other one cause since the war began. We concluded we'd be safer almost any place on earth than in Shanghai if that happened, and we shut our lips tight, opening them only long enough to say "going" whenever urged to stay where we were.

It took us three and a half days to get home, and we had to board a small Chinese junk, out in the middle of the Yangtze River at three o'clock in the morning, and sail from there into Chingkiang port, for the big river boats do not all touch Chingkiang, and our boat was one that did not. There was one consolation about it, the night was so dark we could not see the dirty, muddy, yellow water of the river swirling about our boat. We could hear it though.

Hand-under-hand, down over the side of the big steamer, by the rope route we made our way slowly till we reached the little native craft, bobbing around on the waves like a cork. It was probably one of the dirtiest junks on the river. It was too dark to see it, but our sense of smell was not disordered. Maskee, we were there and that was all we wanted except, perhaps, to be landed on the shore.

But into that romantic-looking and vile-smelling craft had been lowered something before we got into it, something that was long, and black, and shiny. Its newly lacquered surface shone fitfully in the light of the boatman's lantern. Onto this box we found ourselves none-to-gently thrown when the big boat started to pull away from the frail-looking junk, and our craft set its sails to the wind.

Any Port in a Storm

BUT any port in a sea like that was a mercy, and not till ten hours later, when we were on a coolie train, bound for Soochow, did we ourselves answer the question that had been in our minds all day. That elaborate black box on which we had found a seat in the miserable Chinese junk was a coffin, and inside, presumably, was the body of a dead officer being taken back to his home in Kiangsu province for a burial befitting an officer who had given his life in defense of his province.

And it was on this dead man's chest we had ridden through the rough waters of the Yangtze River just before dawn one morning in late September.

Just once since our return have we heard the sound of battle. It has been restful and soothing to jaded nerves after five weeks in hustling, bustling, noisy Shanghai. We agree with the Chinese who claim Soochow is "a little bit of heaven."

And still the war goes on, and the wonder grows as to where all the ammunition comes from, and all the money to buy it, and for how long it had been planned, only waiting for some accident of fate to which to hitch it and start it off. And the wonder grows and grows if at the finish it will not mean that the end of China's solvency has been reached.

Down around the little town of Liuho, where so far the hardest fighting of the war has taken place, there is located a battery of five field guns. According to General Chang, who has command of the Chekiang forces at Liuho, each of these guns is fired sixty times a day, or a total of three hundred shots each twenty-four hours. The cost of each shell ranges from 13 to 17 taels. A tael is worth 70 cents gold, roughly estimated. The guns that make up that battery are all foreign-made guns, and the ammunition which the Chekiang troops are using against their Kiangsu brothers is the same kind of ammunition and bears the same brands as the ammunition which was used on the Western front in the World War.

It would be impossible for a mere writer to estimate with any accuracy the amount of ammunition already used in this war, and it is doubtful if the Chinese themselves know the figures, but it must have been enormous, for this little sector of Liuho does not represent the entire battle front by any means. However, one man close to the Chekiang leader has estimated that it has cost the Chekiang side more than a hundred thousand dollars each day, and if it has cost this side that huge sum, it has certainly cost the Kiangsu side even more, for that army is operating farther away from its base than is Chekiang.

Trying to make a guess at how much the war is costing for ammunition alone is not answering the question of where the ammunition all comes from, nor is anyone telling. Everyone knows that the game of smuggling arms into China has been going on for a long time. One could go through the records of the different foreign courts and to the International Court in Shanghai, and make a tabulation of the cases in which arms smugglers have been prosecuted, but it would mean little in the great numbers of arms and the great amount of ammunition used in this struggle.

Some poor navy gob, from either Great Britain, Japan or the United States, wanting to enjoy an evening of pleasure at the Carleton, perhaps, has sold his gun, and something to go into it, and been arrested and haled into court, and prosecuted for it, and a righteous court and righteous officers have been satisfied at having done their duty. But if one were to go out to the Liuho or the Huangtu, or to any of the other battle fronts where the Chinese rival militarists are hurling death and destruction at each other, using foreign-made guns and foreign-manufactured ammunition, one would smile for the number of prosecutions made and marvel at the number of gun-runners that had made the grade in safety.

How Arms Are Smuggled

PERHAPS there would also be a smile for the efforts which had been made by the foreign authorities to suppress arms smuggling. For the gun-runners have got through with their "75's," with mountain guns, with airplanes, and even with armored cars, and with unnumbered smaller firearms and ammunition untold. In other words, the poor sailor from some nation's man-of-war has sold his rifle for the wherewithal for a night of gaiety and a morning's headache, and has been arrested and disgraced. He has been held up as a "horrible example." But shiploads of heavy artillery and tens of thousands of service rifles, and tons of ammunition have been coming in to China, and no one appears to have known anything about it.

The *China Press,* commenting editorially on this amazing affair, has said: "We have strained at the isolated case of the individual sailor and have prosecuted him vigorously, but we have permitted the big fish to get through. That is the sad story of the attempt of the Powers and of China to place an embargo upon the importation of munitions into this country. When we sit in Shanghai and read the daily accounts of the fighting at the front, and actually hear the rumble of the guns a few miles away across the rice-paddies of Kiangsu, we are likely to become extremely skeptical of the doings of men, especially when we turn to the records of the Washington Conference and find many pages of stenographic notes referring to the proceedings of that body on the subject of arms embargo for China."

Later on in the same editorial, it is written—and this is probably the crux of the arms smuggling in China:

"The trouble with the entire matter is that two important countries were not parties either to the action of the Pekin Diplomatic Corps in 1919 or the attempted action of the Arms Conference at Washington. These countries are Germany and Russia, both of which without question have been bringing arms to China in large quantities. From their own standpoints, these countries are strictly within their legal rights to sell all of the munitions of war to the Chinese Government or any faction in China, from whom they can get payment."

One may not have much patience with General Lu of the Chekiang side, but they must have admiration for the man because he refuses to know when he is licked, and he has been licked since the first days of the war. General Lu's refusal to recognize President Tsao Kun and his government at Pekin, was one of the causes that brought about this war. Lu sat up an independent government of Chekiang, with Hangchow as the capital. He claimed Tsao had bought the presidency of China at the time of his election a year ago this month, and I recall that American newspapers carried a cablegram at the time that Tsao had bought him the presidency of China, paying something over $10,000,000 for it. That was Lu's reason for refusing to recognize the central government, and his excuse for setting up a little government of his own.

The Troubles of General Lu

AT THE beginning of the war people thought Lu had the best of it, and they counted on him to win, but they didn't continue to count that way after the first three days of actual fighting. Bad joss tagged his footsteps constantly, and yet he stuck and he has continued to stick where almost any other leader on earth would have surrendered. Two whole brigades of his troops, and five-sixths of his navy rebelled and went over to Kiangsu's side, but Lu only changed his headquarters from Hangchow to Shanghai, and the war went on. But he resigned as tuchen of Chekiang, and resigning said: "Go to it boys, the first one who reaches Hangchow is 'it,'" and General Sun Chang-fang's soldiers reached it first and General Sun (who by the way is not Dr. Sun Yat Sen as some American newspapers have seemed to think) is "it." There is a good tale connected with that fact, to be told later on in this story.

On Lu's north front all the way from Liuho to Hungtu, where the principal fighting has been going on, Lu has been outnumbered four to one, and has been since the first week of the war. Not only is Lu outnumbered in men but the enemy's guns have a longer range, and are therefore much more deadly. Chi has large numbers of General Wu Pei-fu's troops, all well-trained soldiers, which were sent down to him before Chang Tsao-lin set himself to wipe General Wu off the face of the earth up north, around Mukden, with Pekin the objective.

Undoubtedly Lu's initial success in keeping the Kiangsu army at bay was due to the 25,000 troops which he incorporated into his forces from Fukien. These Fukienese troops, after their defeat in still another war, entered Chekiang and asked to be incorporated into General Lu's army. General Lu consented, though he had to ignore a certain "scrap of paper" he had signed, along with certain other generals, to let them march into his territory, and another scrap of paper was overlooked when he incorporated these men into his army, another cause of the present inter-province war.

These men, seasoned troops, with the added advantage of recent experience in warfare, with also the additional advantage of having instilled a deep hatred of the northern troops, were a godsend to Lu, and he immediately put them into the front ranks against Chi's men. Poor devils, they have long since paid the penalty, and today Lu is using green coolie recruits against Kiangsu, with here and there an older man to be seen in the lines.

Yet, knowing himself licked even if not acknowledging it, Lu is talking to newspaper correspondents, promising a "great northern advance," and the newspapermen are keeping their fingers crossed. No one thinks that Lu is planning to do anything except to hang on to what he still has. That is all that he can hope to do now, but if the man can hold on to his present position it will amount almost to a victory, for by so doing he is detaining the Kiangsu troops in this area and preventing General Chi from sending them to General Wu in the north, and he needs them badly to use against Chang Tsao-lin. The war will be won or lost, from Lu's standpoint, not around Shanghai, but on the Manchurian front.

Now for the yarn about the entrance of General Sun Chuan-fang into Hangchow. It is a tale that Chinese will be telling a thousand years from now; a tale of the anger of the gods over the presumption of Chuan attempting to take possession of the yamen of Chekiang's adored leader, the noble Lu.

It was shortly after one o'clock on September 25 that the first of the soldiers of Sun's army came into the city of Hangchow and took possession of Lu's yamen. At the minute the first soldier crossed the threshold Thunder Hill Pagoda, one of the famous pagodas of China, crashed to the ground and crumbled into a mass of ruins. There was neither wind nor rain, nor earthquake. Under a clear sky this old landmark of more than a thousand years simply tumbled to the ground. There were few more famous landmarks in all China than old Thunder Hill Pagoda near Hangchow, rich in story and tradition.

Both tradition and Chinese literature have it that when Thunder Hill Pagoda goes, the waters of beautiful West Lake will dry up.

The new military governor of Chekiang came into Hangchow after a cross-country march as long as that of Alexander the Great when he set out to conquer the world, but this is as nothing in the minds of the Chinese, who see in his coming and the fall of their loved pagoda, only an ill omen; for not only has this landmark of ten centuries crashed into dust, but with its fall came the release of the white snake, which a thousand years before was a bewitching, beguiling evil fairy. This, remember, is a Chinese tradition, and not a story of my own dreaming. Because of the wickedness of the beautiful, beguiling one, she was at last captured, and before she could turn from her human form which she had adopted, she was imprisoned beneath the foundations of that ninety-foot pagoda.

When the Old Pagoda Fell

THE white snake, the Chinese say, is out of her prison today, the prison where she had lain for ten hundred years, and along with her wriggled her maid, a green snake, who was included in her thousand years' imprisonment. These two snakes will bring wretchedness and misery to their country, the Chinese of Hangchow fear.

But the foreigner has another theory for the fall of the old pagoda, whose passing he regrets because of its great beauty. The thing which has done most to bring about the fall of the old pagoda, the foreigner knows, is not the coming of an upstart tuchen, but the hundreds of years of chipping dust from the bricks of the pagoda. Thirty-odd generations of pilgrims to the hundreds of temples in and about Hangchow have always believed that the dust from the brick was a palliative in the case of an old-fashioned pain, which our New England grandmothers called "belly-ache." Expectant mothers, too, believing the same dust efficacious in bringing the safe delivery of future pilgrims to the temples, all through the centuries have been imbibing tea made from the dust of these bricks in Thunder Hill Pagoda, and the result of all these thousands of people who have been chipping a bit here and a bit there from the bricks all through these ages is a ruined pagoda; and now their simple, superstitious faith has robbed them of their medicine and a city of its favorite landmark.

But what of Tuli Sun Chaun-fang? Half of the city will swear for years to come that his coming brought about the fall of the pagoda, and if you are unbelieving they will ask, "Did it not fall at the hour of his coming?" And what are you going to say?

Mr. Ford's Page

PROSPERITY is bringing the nation a double test. It will test Republican party power to see whether it has learned anything from the last orgy of prosperity. It will test the people in the same way, to see if they have learned anything. For unless we can show that we have learned something, the coming prosperity will be prevented from conferring all of its benefit.

What are the signs at present? On every hand, too many lines of business are out to loot prosperity with the tomahawk of increased prices. In the eyes of shortsighted business, prosperity is a chance pilgrim on the highway, who is to be held up and forced to deliver.

That is the danger at this moment, and it calls for the consideration of political and industrial leaders.

There is already a diligent propaganda whose purpose is to cry "prosperity! prosperity!" so long and lustily that prices may be sent higher under cover of the outcry and the people again deceived with the story that "prosperity naturally brings higher prices!"

Everyone should know by this time that true prosperity is marked by a reduction of prices, and that this is the only way by which prosperity can be made the normal condition and prevented from being a merely spasmodic effort at economic balance.

To get the whole picture in mind, consider a few fundamental principles. First, why should we ever have prosperity at all? Prosperity being the easy and uninterrupted supply of need, and the needs of our people being normal and varied, and the means to supply these needs being ample with a surplus left over for those afar whose sources of supply have not been developed, the more logical question is, Why should we ever be without prosperity? Even in "hard times" we have every element of prosperity, so that the puzzle is that we ever should have to endure "hard times" except through exceeding bad management of our affairs. The economic basis of prosperity is always present.

Then the second question arises, Why should we expect a return of prosperity now, just because we have elected a Republican President? No one now supposes that prosperity is in the custody of any party; Republicans do not turn on the tap in payment for our electing them to office, nor do they turn off the tap in resentment of defeat. But it is to be supposed that in a country where the development of industry depends on individual initiative, a political doctrine which insists that business should be taxed down to the water-line, hindered by laws that express enmity toward business—such a doctrine will naturally chill initiative; while a political doctrine that holds that business is one of the nation's natural rights and necessities, and should be free, and should be encouraged, will have the effect of encouraging initiative. It is felt that President Coolidge would rather help business than hamper it, would rather free it than fret it, and so, all the other elements being present, it is felt that initiative is ready to shove off into larger ventures, because it has sense of confidence, it is assured that its success is more desired than its failure.

However, so many people are ready to read partisan meanings into such a statement, that it should be said, the same sense of confidence and security permeated the nation upon President Wilson's election. Mr. Wilson knew and understood that a prime national necessity was freedom in business.

Anyway, the fact is that this sense of confidence is one of the results of Mr. Coolidge's election, and industrial energies are released. The people feel that the way is clear for a revival of effort and a consequent return of prosperity.

Builders want to build, bakers want to bake, manufacturers want to produce, railroads want to carry, workingmen want to work, merchants want to sell, housewives want to buy—the spirit to do things, to accomplish service, to supply demands, has shaken off its shackles of uncertainty; the entire industrial army waits to move forward.

And what occurs? Why, some men say, "This is the time to make a big haul. People begin to want what we have to sell; therefore it is a good time to boost the price; they're in the mood to buy and they will pay the more."

And that means that already some men are planning to lay an extra tax on the people's confidence and enterprise. It means that some shortsighted business men are already planning to make it harder for people to resume a satisfactory economic life. That is what high prices do.

Now, insofar as this is deliberately done with a full knowledge of the principles involved, it is criminal, just as criminal as cashing in on a nation's war distress. But for the most part it is ignorance. Industry understands so little the essential laws of prosperity, that times of business revival appear like grab-bag periods in which the highest business wisdom is to get while the getting is good.

This is the danger which confronts the nation in the promised period of prosperity that is now looked for.

This readiness to tax prosperity and render its arrival more difficult is condemnable on several grounds. It is not in the spirit of co-operation. A business that stands at the side of the road demanding a tax of prosperity is not a part of the main procession which is escorting prosperity back to the country. Setting up tollgates against prosperity is alien to the spirit of co-operation.

Moreover, it is not good business. In proportion as business increases, cost of production decreases. A slack shop is costlier to maintain than a busy shop. The duty of every manager of industry is to encourage business by making it easy for people to obtain what they need at a price they can afford. A new revival of confidence and energy in the nation should be met halfway by a decrease in prices, a decrease that is equitable with the decrease in cost. To hold up prices, or even send them higher, because the mounting tides of the people's energy will make it possible to collect such prices, is to tax the people more heavily than even a government could. Good management pays dividends in good wages, lower prices and more business; it is very bad management that can see in a revival of national ambition only another opportunity to lay heavier burdens on the spirit of enterprise.

Now this is something to be thought of, especially by those who are shouting "prosperity!" in the greedy hope of greater unearned gains. It is to be thought of by the Government also, for it has been a weakness of governments in the past to take it for granted that "things have righted themselves" because business has revived. It is not too early to begin the work of preventing the suspicion that our increased national confidence was brought about mainly to produce a new exploitation of the people's needs, or is to be used mainly by those groups whose main interest is not in business itself but in the highest possible rates in the shortest possible time.

It may be instructive to remember that "the goose which laid the golden egg," did not cease because she forgot the art, or because there came a "cycle" when golden eggs were impossible; she ceased laying golden eggs because she was *killed*. Prosperity does not cease because its elements fail, or because it is destined by natural law to go in "cycles"—it ceases because it is harshly dealt with, wounded, neglected, treated as something to be constantly milked and never fed.

It is important to examine our attitude toward the expected resumption of work by everyone and the production of the things the people use. Do we regard it as an opportunity for another raid on the people's pocket, or as a recovery which it should be everyone's care to cherish and make permanent?

A CERTAIN type of business, which is not worthy of the name of business, regards returning prosperity as brigands regard a rich merchant returning from market. It is something to be held up by high prices. As soon as restored confidence and renewed energy show themselves in new national business initiative, certain groups go out to reap exorbitant profits. Prosperity is the standard excuse for higher prices, whereas Prosperity should be the promoter of lower prices. Increased demand permits increased production which in return permits decreased costs. In prosperous times a dollar should buy a dollar's worth. Imagine a prosperity Dollar that only purchases Sixty Cents' worth! Since men of finance have failed to make the dollar worth a hundred cents, men of industry must do it. And they can. True business wisdom can.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Stock Gambling No Barometer

AS A criterion of true business prosperity the speculative markets are a failure. This truth is recognized by legitimate business, yet the average man seems to regard the gambling in stocks and bonds as an indicator of the business trend. As a matter of fact it is only a thermometer showing the rise and fall of the gambling fever. Activity in stocks does not indicate that the machines are moving, the men working and the public buying.

"Public buying taxes the ability of brokers to meet the demand" is the frequent announcement of newspapers, but as a barometer of business it is not infallible, for business is the production of commodities and their distribution to the public on an equitable and mutually profitable basis.

Improvement in legitimate business tends to develop the spirit of speculation beyond all reason, but a speculative boom has no bearing on the result so far as the country at large is concerned. Indeed, speculation may easily be used to obstruct a genuine revival of trade and industry.

A national administration is responsible for neither the successes nor the failures of speculation. An administration may affect legitimate business for good or ill, but even then the ultimate determination of success depends more on the constructiveness of individual effort than upon any other influence. The moths which flutter about the speculative candle only singe their own wings. They have no say in the outcome.

It is interesting in this connection to note the reasoning of the investment press, as voiced by Ernest Pool, of New York, in the Chicago *Investment News*. He explains that the flood of speculation, caused by the rush of optimistic buyers in the stock market the day after election, receded quickly because the optimistic speculators met initial losses which ended the boom. These losers, however, were not the big investment firms. They were not ready to operate yet. They waited. But when these interests have acquired a sufficient number of shares they will loosen the check rein, and permit the rise in quotations they believe inevitable, take their profits, and begin the process over again.

The amateur investor may think he can beat this game, but he can not.

Why Not Let the People Decide It?

LEGISLATURES and women's clubs may learn much from the action of the people of Massachusetts on the so-called "child labor amendment" which is proposed for the Constitution of the United States. The people of that State overwhelmingly refused to turn their children over to the control of a Federal Bureau from birth until 18 years of age. The people of every other American State will make the same refusal, if they are given the incentive to study the proposal as was Massachusetts, by the people being required to vote upon it.

It should not be claimed that the people of Massachusetts or any other State are opposed to proper safeguards for children. One of the unfortunate consequences of every ill-formed proposal is that it brings out wrong angles of support and antagonism. Opposition to the amendment is sometimes voiced in language that would make it appear there was no need whatever for preserving the rights of children or preventing the encroachments of greed and ignorance upon the plastic period of youth. The corporation argument, in this respect, when not crudely wrong, is always open to suspicion. Child labor should never be considered from the point of view of any industry, but solely from the point of view of the child. And constitutional amendments should always be considered from the point of view of national liberty.

Support of the amendment shows no indication whatever of being aware of a 16 or 17 or 18 year old boy's *right to be active,* and not to be a compulsory loafer. It shows no appreciation of the vast strides that have been made toward abolishing the abuses of child labor in most of the States. It shows no understanding of the seriousness of handing over to a band of Washington professionals one of the fundamental rights which ought to remain, pliable, in the hands of the people. And it is utterly oblivious of the ultimate result of putting periodical plasters—not by popular assent, but by propagandized legislative enactment—on the Constitution. The power granted to Congress is one that Congress would not dare use, but Congress would almost certainly be bulldozed into using it by the most insistent and unrepresentative lobby that ever camped out in Washington.

Massachusetts took the course proper. Any Constitutional amendment so intimately affecting the American home should be referred to the votes of the American home. Legislatures of other states would be carrying out American principles if they too would give their constituents the same right of approval or veto.

Stampede methods ought to be rebuked. One-sided propaganda should be scrutinized. Let women club members ask themselves how much of the other side of the question is ever presented to them.

When Homes Are Beautiful

TWO of the things that are worrying thinking people today are the decrease in the size of families and the decay of home life. France seems to be especially alive to the former, England to the latter. At the special request of M. Poincare the Academie Francaise will award a special prize of 25,000 francs to a family in La Vendee where there are ten children.

The interest of M. Poincare may be largely due to the fact that four of these children were born on the same day, their god-parents being King George, the Queen of the Belgians, the Empress of Russia, and M. Poincare himself.

France views with apprehension her low birth-rate, and rightly sees in it a sign of national decay. In like manner England is "getting the wind up" over "the decay of the home and domesticity." This recently formed the subject of debate before the Cambridge University Union. One of the speakers was frankly pessimistic on the matter. He cited as one of the causes that women were trying to do men's work in addition to their own, and were making a mess of it.

One other speaker sarcastically remarked that at no time had the home been more important than at present, because "an election was held every autumn to get them built."

Another Illusion Shattered

WHO has not read the story of when Sir Walter Raleigh was enjoying a quiet pipe his servant, thinking that he had caught fire, came behind him and deluged him with a bucket of water? Raleigh has long been regarded as the apostle of the tobacco habit in the Old World; but now the foundation for this assertion seems to be as mythical as the moon which an eminent astronomer discovered *did not* give its "flickering light" on the occasion of the burial of Sir John Moore, for the simple reason that there was no moon in the heavens that night.

As the pioneer of the potato in Europe Raleigh still stands unchallenged, but in the words of Wilfred Partington, an English writer who has got out a book telling us all about it, "smoking was first seen by Europeans in 1492, when two of Columbus's sailors landed in Cuba and reported that the natives carried firebrands and perfumed themselves by inhaling and blowing through their mouths and noses the smoke of a dried herb."

It is known that Hernandez, a Spanish physician, brought tobacco to Spain about 1560, and the fact that a year later Jean Nicot, ambassador at Lisbon, presented some to Catherine de Medicis, would indicate that the use of tobacco by women is quite "old stuff." It is from Nicot that we derive the word nicotine, and probably he is the one to whom the distinction of introducing the "perfumed firebrands" to Europe most justly belongs.

But it is wonderful how the people of the Older World got along without the seductive weed. As Mr. Partington points out: "Neither Horace nor Epicurus ever saw a cigar; Lucian and Petronius existed without cigarets, and Omar Khayyam himself never heard of a hookah."

In the modern world, however, tobacco fills a big place, commercially and socially. In a recent compilation of newspaper advertisers, the annual expenditure of the American Tobacco Company leads.

Mr. Baruch's Ruling Mind

WHAT is Barney Baruch up to now? Where does the Federal Trade Commission—that "inquisitorial body," as he calls it—block his path that he should be so desirous of establishing a Court of Commerce? Why has he so far departed from the principles which his old friend Woodrow Wilson described as The New Freedom?

Preparatory to his suggestion of a Court of Commerce, Mr. Baruch asks, "shall business be permitted to combine for better production and distribution, thereby cheapening both and resulting in lower prices for the consumer?"

The first response to the question is a request that Mr. Baruch produce in evidence such a combination for such a purpose. Where can he find one? He knows, of course, the combinations that would like to be made just now. He knows, also, why such combinations are desired. He knows that at least one big combination is proposed not for the sake of the consumer, but for the sake of the combiners, for it is true that today certain allied groups of business are collapsing upon themselves and are seeking salvation by combinations whose financial burden can be unloaded on the public, while the combiners retain control. Let him first produce a combination that has resulted in benefit to the public. Or is he speaking not of what is, but what he hopes will be?

He goes on, however, as if the thing he describes were already in existence. "These combinations by their mass production increase the standard of living by placing in the hands of the greatest number many of the things which they need for comfort and luxury." It is too bad he did not specify. Such service is being performed, but not by the means he describes.

What is it exactly that Mr. Baruch wants? He wants "a court of commerce before which business men would come with such questions as whether in time of over-production and low prices *they could cut down production and fix a price.*"

That is what he wants—government sanction to decrease employment and increase prices. This is socialism from the top; paternalism in the worst form that can be conceived for the Republic.

It is strange that Mr. Baruch should be thus interested. He is out of business, he told the country when he happened along out West to help the farmers organize. His interest is purely in the public welfare, he asserted. Yet in his present proposal he seems to be mostly interested in "what we are going to do with our great aggregations of capital." That, he says, is one of the matters which press for early determination.

His anxiety may be easily allayed: we are going to make Capital work; we are not going to rear in this country any Court of Commerce which shall see that great aggregations of timid, idle capital are protected in a way that great aggregations of wage-earners are not protected. Capital in honest business that does not need price-fixing, and does not need court permission to cut down production. Vast aggregations of capital that desire to hold aloof from all the risks and toils of business may remain vast aggregations of capital, and industry, growing by its own progress in management, will refuse to pay it toll in interests or dividends because industry can provide its own capital.

Mr. Baruch is strangely oblivious to the signs of the times. In his own way he commits the same blunder that Mr. La Follette committed, but which Woodrow Wilson never did—he confuses Big Business with Big Money.

If Mr. Baruch will read over his proposal again he will see that it is not in the interest of protecting Business; it merely designs to protect Money which is afraid to go into business.

The Self-Starter

TO A representative of the Manchester *Guardian* a prominent educationist recently stated that success in life comes not so much to the "clever devil" as to the man whose personality is co-ordinated and inspired by some steadying and dynamic principle. Or to put it more simply—the man of character. "Bluntly put," says this educationist, "some men are like wheelbarrows—they only move when they are pushed from behind."

This is a very apt illustration, and one which could be enlarged upon. The man of character is a self-starter—he carries his own power.

The same authority contends that knowledge is not everything. Not to be underrated, of course, but to be subordinated to the development of the whole personality. Further, "It is really more important what a boy *is* than what he *knows.*"

An intensive process of cramming with facts is not education, but the building up of character is.

Jamestown, New York, Pays Its Own Way

Mayor's Enterprise and Citizens' Faith Build Up Successful Public Utilities

By E. L. M'COLGIN

JAMESTOWN, a Western New York State community of slightly more than forty thousand population, has developed its publicly owned electric plant, waterworks and public market without a cent of cost to the taxpayers.

The city does its own street paving for 25 per cent less than contractors charge other communities for inferior work. Gravel comes from the city's own pit.

The Jamestown General Hospital is operated by the city government, and the people recently voted for the establishment of a public milk distribution system.

If the present rates charged Jamestown people for current from their own electric plant were merely raised to the level of those charged other New York State cities and everyone patronized the plant, the profits would make it unnecessary to levy any city taxes.

Thirty years ago Mayor Samuel A. Carlson, then public works commissioner, persuaded the people of Jamestown to spend thirty thousand dollars for a public electric plant.

Today this plant represents an investment of more than one and one-quarter million dollars. It has cost the taxpayers nothing, since its surplus earnings have paid the interest and sinking funds of all bond issues for its construction.

Incidentally, the New York public service commission has officially found that the Jamestown electric plant charges off for depreciation 2 per cent more a year than private electric companies in the state do.

The base rate for electricity in Jamestown is five cents a kilowatt. Ten cents is the average charge in two hundred other Western New York communities.

Most Jamestown families can do their lighting and cooking for about four or five dollars a month, the cooking rate being three and one-half cents a kilowatt. The electric power rate scales down to one and one-half cents a kilowatt.

Niagara Falls current is sold in Jamestown by a company which has slashed prevailing outside rates for the same electricity that it may compete with the public plant. However, municipal current is preferred by power users because it is free from the line interruptions of the widely extended Niagara distribution system.

A new five-thousand kilowatt steam turbine generator is just being made ready for operation in the city plant. Since the output of this new unit has already been apportioned, another generator of equal capacity will have to be installed to meet new power demands.

The rapid expansion of the municipal plant indicates with what success it has withstood competition meant to eliminate a provoking example of public ownership.

It would be interesting to know how people elsewhere in New York State, who are denied them, regard the price concessions made in Jamestown by the Niagara Falls electric interests.

Samuel A. Carlson, now serving his seventeenth year as mayor, is responsible for the inception and extension of all the Jamestown public utilities and related services.

When Carlson was first elected mayor of Jamestown, the local boss of his national party, accompanied by an editorial accomplice, called upon the new executive and submitted a complete appointment list. They insisted that Carlson accept the whole slate regardless of the fitness of any of the party workers whose deficiencies were indicated by the mayor.

When Carlson insisted upon making his appointments, solely upon the merit basis, war was declared upon him by the party bosses and the newspaper that worked with them. However, this has not prevented the mayor being re-elected eight times.

The predominant population group in Jamestown is made up of Swedes. There is also a sizeable segment of people from England. These elements with their traditions of honest public ownership in Swedish and English cities have been staunch supporters of the extensions of Jamestown's civic activities.

It is proverbial that the first one hundred dollars accumulated by a Swede in Jamestown is used for a down-payment on a home. There is nothing radical about these people. They are intelligent enough to appreciate honest, economical administration of their city's affairs with consequent low taxes.

Carlson's successful leadership has been largely due to his ability to mobilize the Swedish vote when the "regular" politicians were pressing him hard. It is a rare person who can deal with Scandinavian psychology and here is where the mayor has outwitted his opponents. However, the mayor's talent as an executive has been demonstrated by his placing the management of the utility and welfare operations in the hands of qualified laymen free from political obligations. Big manufacturers, technical engineers and corporation lawyers were put upon their mettle by being made personally responsible for municipal ownership, which many of them had vigorously opposed. As the leading taxpayers, they would have to pay the bulk of operating deficits themselves if there was mismanagement.

Frank O. Anderson, president of the Empire Case Goods Company, a director of the Art Metal Company and the Jamestown Malleable Products Company, was chairman of the city utilities board during its expansion period. Mr. Anderson recently retired to devote himself to building the new two-million-dollar Hotel Jamestown. He was replaced by Karl Petersen, president of the Crescent Tool Company, a nationally known industry.

The Jamestown waterworks has a two-million-dollar plant, entirely paid for by surplus earnings in the same way as the electric plant. There is a duplicate source of water supply and a duplicate pumping station to guard against droughts and breakdowns.

Neither the Jamestown waterworks nor the electric plant broke down during the war. The waterworks pumping station in a big eastern railroad and industrial center went to pieces during the worst winter of the war because the politicians had skimped maintenance to justify vote-getting low rates while loading the pay roll with useless party workers.

SAMUEL A. CARLSON,

The man whose foresight has accomplished much.

Chairman Anderson found, on a visit to a Pennsylvania city of Jamestown's size, the waterworks of which were operated for political purposes, that thirty-nine men were employed to do the work that nine men performed in the Jamestown pumping station.

The electric and water rates were temporarily increased by Chairman Anderson when war-time coal and labor prices required adjustment. This was opposed by aldermen with their eyes on vote-getting at public expense. However, Anderson fought the issue before the state public service commission and won.

The grocer type of mayor would have been ordered by his party boss to retire Anderson at this juncture. The indirect purchase of public favor and votes at the public expense is good orthodox politics.

The municipally operated General Hospital in Jamestown.

The personnel of Jamestown's utility and welfare boards has always been named by Mayor Carlson and his independence of the regular parties has enabled competent boards to function without hindrance.

When Jamestown purchased the private water plant, Carlson drafted F. W. Stevens, attorney for the water company, as chairman of the new city water board. Although Stevens had fought the city's purchase of the property, the mayor shrewdly knew Stevens would maintain his prestige by giving the city superior management.

Subsequently, when the first New York public service commission was created, Governor Charles E. Hughes, now Secretary of State, appointed Stevens chairman in recognition of his record in Jamestown. Stevens is now in charge of the Federal valuation of the railroads

Many of the old-time Jamestown councilmen were spokesmen for paving contractors and material dealers who "took care" of campaign expenses and other financial emergencies. Carlson ended this by having the city do its own paving and construction work.

Street repairing, sweeping, and snow removal are handled cheaply and efficiently by the city's own forces. Jamestown is very hilly and has long winters with frequent, deep snows. These conditions put the street paving and maintenance organization to a severe test.

Last summer bids were obtained for a new bridge. The best figure was $22,000. The city engineer proceeded to build the bridge for $13,000. By exercising ingenuity the street was closed but two weeks whereas careless political contractors would have compelled traffic to be detoured all season long.

The city welfare board, of which Arthur W. Kettle, a lawyer-manufacturer, is chairman, directs the city market, general hospital, the park department and other social activities of the Jamestown government.

Mayor Carlson remarked the other day: "I don't know of any other city that has ever established a utility without either an initial bond issue or tax levy. However, we built our public market without either."

The brick and stone for the market building came from torn-up pavements. A surplus in the general revenue, the result of good housekeeping, paid for the roof and labor.

The large lot on which the market stands was leased for a long term. The market experiment proving successful, the lot is being purchased on the installment plan by using surplus earnings. The purchase price, $35,000, has now been reduced to $13,000 and that sum will be paid off in a couple of years.

The public market is patronized by ten thousand persons during the three days it is open each week.

The city operates the Jamestown General Hospital. It has an operating deficit of about $35,000 a year. In other cities where general hospitals are operated by philanthropic agencies the deficits have to be met by community chests or other sources of contributions. Here all the taxpayers have to pay their share.

Observing the fearful waste in milk distribution caused by dozens of competing wagons covering the same routes, Mayor Carlson vainly tried to get the distributors to form a consolidated company that would operate a central milk-handling station and maintain higher standards. This would enable the producer to be paid higher prices; the distributor to make more money and the public to get better and cheaper milk, as many cities have found.

The milkmen could not see the light. Mayor Carlson then asked the voters to authorize the establishment of a city milk distribution system. He was defeated the first time and then a $150,000 bond issue was voted for the purpose. Epidemics and infant mortality caused by reckless handling of milk with no reward to producers of clean, rich milk had much to do with the favorable decision of the people.

The milk project is now in abeyance awaiting the court's determination of the question as to whether or not it is constitutional. There does not seem to be much doubt on this point, and unless the milk dealers hurry they will go the way of the electric and water companies and the paving contractors.

Mayor Carlson regards the fire department as a waster of man power and city money because the firemen sit around most of the time waiting for infrequent fire alarms. He maintains the fire and police departments should be one organization. Then the firemen could help direct traffic, ferret out bootleggers and also flush down streets instead of playing checkers. The firemen and policemen could be paid higher wages because fewer men would be needed. Since he is a persistent man, Carlson will doubtless have his way in this matter despite the opposition of lazy officeholders and petty aldermanic politicians who encourage them in return for votes. Ancient Rome had a combined fire and police department.

Two years ago Carlson got a new city charter from the state assembly. The new charter provides for a board of twelve aldermen, six of whom are elected from districts and the other six at large. There is no party designation on the ballot. The new charter consolidates the various utility and welfare boards into two bodies appointed by the mayor. The sale of any city utilities is expressly forbidden. The consolidation of the accounting and clerical work at the city hall into one office is authorized.

However, the private utility lobby succeeded in having the state withhold authority for Jamestown to issue certificates of indebtedness for extensions of self-sustaining utilities, which would avoid the need for expensive bond issue elections.

The Jamestown public utilities are thorns in the flesh of the private utilities throughout the state and elsewhere whose common stock usually represents no invested capital. The insiders vote themselves this common stock, which carries voting control, and build the plants with bonds or preferred stock. Jamestown rates will carry the actual investment.

Ernest Cawcroft, a member of the "English" element in Jamestown and corporation counsel, has been a tower of strength to the mayor and others in charge

Mt. Washington—a Place of Winter Outings

The Snow-Clad Crown of New England; Unique Among Mountains of the World

By M. L. FENTON

MT. WASHINGTON, the crown of New England, and the oldest American mountain resort center, is no longer merely a summer vacation capital.

America's classic mountain is becoming the focal point for winter outings that are expected soon to rival the fashionable summer season. Those who have visited the White Mountains in the winter declare the scenic effects and the bracing, health-giving reactions are even superior to the glorious summers.

The Army Air Service has made some photographs of this region from the clouds that enable the Presidential Range to be completely visualized for the first time.

The landfall of the early voyagers to the New England coast, Mt. Washington was quaintly termed the Christall Hill by these ancient mariners. It was also called the White Hill, both names being applied because of the glinting gray rocks on its bald top.

The 6,293 feet altitude of Mt. Washington makes it the highest point east of the Mississippi River, save Mt. Mitchell in North Carolina. However, the stark, bare granite of Washington and his companion peaks of the Presidential Range looms up in bolder relief than the softly rounded and wooded Carolinians.

Mts. Washington, Adams and Madison are as impressive as many peaks elsewhere that have gross heights of 10,000 feet or more. The Presidential Range is so sharply defined and springs from such a low base elevation, about 800 feet, that they compare with many other mountains that rest on plateaus 5,000 feet or higher. It is the mountain one sees and not the high plain that gives the smashing effect.

Photographs by the U. S. Army Air Service.

Mt. Washington in midsummer. The carriage road is clearly shown. The Great Gulf and Mts. Adams and Madison also appear.

The Mt. Washington carriage road in midwinter.

As a matter of fact, mountaineers, geologists and other scientists rank Mt. Washington as one of the really notable American peaks. It is better known all over the world than many a commonplace peak of twelve or fourteen thousand feet altitude. One can have more thrilling experiences on it than almost any other mountain in the country. Certainly it is unique among the mountains of the world without permanent ice fields or glaciers.

Perhaps the most distinctive feature of Mt. Washington is its remarkable range of weather. The American Academy for the Advancement of Science says the summit forms an arctic island in the temperate zone, having the same climate as Hopedale, Labrador, and the middle of Greenland.

Mt. Washington has had the most extreme combination of weather ever recorded on earth. In February, 1886, the United States Signal Service, which had a station on the summit, recorded a temperature of 52 degrees below zero with a wind velocity of 184 miles. Perhaps the wind blew a bit stronger that day because upon registering this figure the anemomoter or wind gauge gave it up and blew away. In January, 1877, a wind blew 186 miles an hour, but the temperature was not so low as in 1886.

Belmore Browne and Herschel Parker, the first to climb Mt. McKinley in Alaska, altitude 20,300 feet and almost within the Arctic Circle, had Mt. Washington's weather in mind when planning their sensational assault. Fortunately they did not have to withstand anything so extreme.

An Air Service officer who has flown at great heights in protective clothing and with heating apparatus has said that anyone exposing himself to such weather as this Mt. Washington record would have his life snuffed out almost instantly.

There is not a month in the year when snow does not fall on Mt. Washington and people have been killed by exposure on its slopes in June. More lives have been lost on this mild-appearing but often savage mountain than any other in America. Climbing parties have been marooned in shelter huts for days at a time although they set out in fine, mild weather.

However, this need not deter anyone in good physical condition who has sufficient common sense to accept competent advice ascending the mountain even in midwinter. Almost every death is due to stubbornness or heedless blundering. The increasing number of winter climbers may make it necessary for the Federal Forest Service to supervise them to prevent reckless or unfit persons from taking risks. The first fatality was that of Frederick Strickland, the son of Sir George Strickland, a member of Parliament, who ignored the warning of his guide and proceeded alone to his death.

The experience of Dr. B. L. Ball, in 1855, is probably unparalleled. He wandered about the mountain in an October snowstorm for sixty hours and survived the ordeal to die in tropical Panama. His knowledge as a physician, his age of thirty-five, his good health and the fact that he carried a large umbrella at the time account for his remarkable escape. However, his sufferings from frostbite were excruciating.

The first carriage road to the top of an American mountain was opened for traffic on Mt. Washington in 1861. Now dozens of motors are driven to the top every mild summer day. The road winds about the shoulders of the mountain for 8 miles, ascending 4,600 feet from the base station in the Glen on the east side. The average grade is one foot rise in eight and the steepest is one in six. It is entirely safe since it was laid out by good engineers and is maintained in excellent condition.

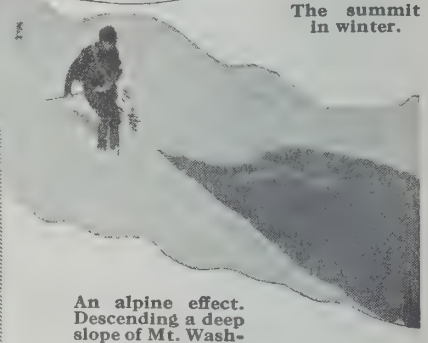
The cog railway which runs to the top of Mt. Washington, completed in 1869, was the first mountain railway in the world. It was designed and built by Sylvester Marsh, a typical Yankee genius. A native of the Granite State, he accumulated his fortune as a pioneer Chicago packer. Returning to New Hampshire, Marsh developed this original railway and lived to see engineers adapt his idea in Switzerland and on other mountain lines of this kind.

The railway ascends from the western side near the Bretton Woods district, climbing 3,600 feet in about three miles of track. There has never been an accident to a passenger.

A moderate-sized summer hotel is at the summit. Many persons have spent a night there to witness the wonderful cloud and sunrise scenes of early morning. The city dweller never obtains a hint of the fascinating views that can be seen from such heights as Mt. Washington.

James Bryce, whose exploits as a mountain climber all over the world compare with his reputation as a writer and diplomat, made his summer residence near Mt. Washington when he was ambassador to this country. He constructed some mountain trails for the convenience of fellow enthusiasts.

The summit in winter.



An alpine effect. Descending a deep slope of Mt. Washington in winter.

Darby Field, who was probably a native of Boston, England, made the first ascent of Mt. Washington in 1642. The Indians had always feared to proceed above timberline but when Field boldly started toward the top a couple of Indians followed him.

The first record of the name Washington applied to the great peak of the range is on a map made in 1784. In 1820 a climbing party of local notables named the rest of the so-called Presidential Range after early statesmen of the Republic.

While there is a certain appropriateness in naming Mt. Carrigan in New Hampshire after the man who was responsible for mapping the state, and Mt. Whitney in California for the scientist who had so much to do with exploring the Sierras, there is little or no justification for applying the names of politicians to notable mountains.

Such Indian names for White Mountain peaks as Chocorua, Wonalancet and Passaconaway have a flavor that is wholly lacking in the others. However, the real first families of America were held in low esteem by the pioneers, who expressed their civic spirit by fastening the names of political heroes on the principal mountains. On second thought one can perhaps forgive them for Mt. Washington.

Mt. Washington is the outstanding member of a group of connected peaks that surmount a tremendous granitic uplift. The great mass is surrounded by deep stream-carrying valleys and its sides are deeply scored by glacial cirques locally termed gulfs and ravines that add to the wildness of the scenes. The shoulders that intervene between these gashes in the mountain sides are giant buttresses that support the towering summits.

Northward from Mt. Washington the Presidential Range swings around an immense gorge known as the Great Gulf. The carriage road passes along the verge of this yawning depth whose walls descend more than half a mile.

The northern peaks, as one proceeds from Washington, are Mt. Clay (5,500 feet), Jefferson (5,725 feet), Sam Adams, Adams (5,805 feet), J. Q. Adams, and Madison (5,380 feet). There are several well marked and constructed trails connecting these peaks with Mt. Washington.

The Appalachian Mountain Club has built several comfortable huts in the col between Madison and Adams. In the summer season climbers may obtain meals and lodgings at these and many other huts established throughout the high peak district by this club.

The southern peaks of the range extending to the famous Crawford Notch are Mts. Monroe (5,390 feet), Franklin, Pleasant, Clinton, Jackson and Webster, in the order named. The spectacular ledges of Mt. Webster will be recalled by those who have passed through the notch.

The two little Lakes of the Clouds on a shoulder of Mt. Washington are the center of the south peak district. The hut located there has saved many climbers since the long traverse from Crawford to Washington is often swept by sudden storms. Four lives have been lost on these southern peaks but the new huts have rendered the route much safer.

The enormous Tuckerman and Huntington ravines and the Gulf of Slides indent the eastern wall of Mt. Washington, of which Boott's Spur is another prominent

The King Takes Last Look 'Round Before War

King George V Reviewed His People for a Task He Dared Not Speak of

By THOMAS CAMERON TAYLOR

"THIS ship is as wide as Piccadilly!" King George V was poking around under the hull of a great battleship on the stocks in a Clyde shipyard, when he made that observation. The whole program of the afternoon's tour seemed in danger of being held up while the royal visitor satisfied his interest. He was on his way to have tea with a duke, too. "An understandable interest," remarked the attendant scribes who had been assigned to the series of tours of British industrial centers which the King and Queen undertook in midsummer of 1914; "the King is a navy man. He has seen more of the seas of the world than any monarch who ever lived." An understandable interest, indeed!

They constituted quite an interesting company, the men who had been assigned a place in the press coach of the royal train for that tour. The circumstances were not quite normal. Ireland was seething with disturbance. The suffragettes had attained astonishing efficiency in advertisement-by-destruction. There were possibilities of interesting incident, for, using ancient Holyrood Palace as headquarters, the royal party was to travel by railroad and automobile to various industrial areas and historic parts of Scotland. The scribes were tried men, therefore. In one group in the press coach could be noted a genial war correspondent who had not been far off when the Jameson Raid on the Transvaal took place, who had been through the Boer War and the Boxer Rebellion in China, and who knew just what it means to travel on camel back in the Soudan—in a hurry; beside him was a writer to whom the Balkans were better known than his native Ireland; to another, old Stamboul had long been a happy hunting ground; the quiet, keen man who spoke but seldom was an author whose first work was even then pleasingly fresh in the public mind, and who was later to earn in full measure the honor of knighthood; another could tell with great relish of a talk with Roosevelt on the edge of an African forest; and still another recalled casually an encounter with a Mohammedan war agent of Germany in distant Bornu two years before.

When the last-mentioned opined that such an encounter should be brought to official notice, they smiled, and someone hurled at him a convenient quotation—

> "Friend of my heart, is it meet or wise
> To warn a king of his enemies?"

They took no stock in alarms and did not trade in rumor. Most of them had been on the royal tours in England, had followed the King through the steel and textile districts, and were still noncommittal as to what all this democratizing of royalty imported. Now, in this day's tour of the cradles of mighty ships which flank the banks of the Clyde, the King's keen interest in the latest of the fighting ships was thoroughly understandable to them all. The King was a sailor! Of course.

The Heart of Scotland

BY THIS time we had disposed of the sections of the tour devoted expressly to Scottish officialdom. We had seen the party arrive in Edinburgh, and duly recorded the handing over of the keys of the city to the King and the immediate return of the same to the keeping of his trusted City Fathers. A well-known Scottish regiment had exercised once again its sole right to march through the city with fixed bayonets. The chimneys of Holyrood Palace were smoking merrily, and the big open fires of the venerable pile were contributing to the comfort of a king again after many years. In "auld St. Giles" a new chapel had been dedicated to the use of the Knights of the Thistle, the most exalted Scottish Order. The "state visit" to Glasgow had been paid, and a few Territorial battalions had made a brave display with the kilted Regulars and some squadrons of cavalry. Our contact with Scottish officialdom had yielded two points of interest: at Edinburgh a veteran Scottish journalist had discovered that the King was a distant throwback to his Stuart ancestry; at Glasgow, a prominent official had handed to the King the wrong speech, but the alert monarch had discovered the mistake in the first sentence, and had roared with laughter, bringing from an observant journalist the remark: "That is the first laugh the King has had since these tours began, a month ago." The remark was important, for it was unusual for the kindly and good-humored head of the reigning House to bear such an air of deep gravity as we now realized had marked him throughout the tour.

We forgot for the time being the unusual gravity of the King, in his earnest interest in the activities of the people.

"No man knoweth the mind of a King." It was mid-July. An Austrian Archduke had been slain in Serbia two weeks previously, but that was the last thing the British people were worrying about, although the experienced scribes spoke guardedly of a distinct chill in the East wind.

Through the shipyards, through the mining districts, through the steel mills and the places where miles of steel ribbon were being wound upon the inner tubes of great guns, we trailed the royal party and found unfailing delight in the struggles of the official photographer to manage with only two hands a refractory silk topper and a bulky stand camera. From the field of that magnificent industrial achievement, which made of a once-negligible creek named the Clyde one of the most renowned waterways of the world, the course lay northward to the great shrines of that tradition which means so much to Scotland: Linlithgow Palace, once the finest of the dwellings of the Scottish kings, and the birthplace of Mary Queen of Scots, its every room and dungeon packed with history; Dundee, with industries dependent upon the imperial connection; the lands along the Forth, where Scottish history can be read at every turn; and Stirling Castle, that half-tide rock which was buffeted by every surge of war which flowed and ebbed over Scotland for many grim centuries.

Altogether the whole tour afforded splendid material for the descriptive writers, and the newspapers spread in stirring columns the tale of those historic deeds and modern achievements which denote the spirit and force of Scotland.

And just as the visit ended we had adequate explanation of the grave demeanor of the King.

It came in the form of a telegram to one of the war correspondents, and the gallant big fellow looked gray as he remarked:

"It has come. Germany is moving. Private information, but sure. Goodbye, everybody."

We realized then that we had participated in a royal review of a people for a grim and inevitable task, a review so skillful in method that it had awakened the spirit of a nation without a word being uttered which might provoke the feared catastrophe or hamper the dismayed politicians in their efforts to avert it.

* * *

The value and power of tradition are nowhere greater than in Scotland, and by none more highly appraised or more unerringly handled than by the British. Passing in rapid review the events of the tour, we found that the King had touched at its most responsive points the life of the people. Meeting every day the descendants of great chiefs who in their day had openly raised standards of war and brought armies to the rallying grounds, and knowing the almost inevitable imminence of a terrible need, he could yet utter no word which might be construed or misconstrued by a watchful enemy as a word meaning war.

Time and again, across the lands which he viewed from the ancient castles, the fiery cross had been sped to call the clans to the field, but he could send no such message to his people, however great the need. He had another standard to raise, however, and right well he did it. Unprepared as Scotland was when, two weeks later, the blow fell, it found a people stirred freshly to a knowledge of what they were and whence they came and by what hard-won means they had been molded by forefathers who cherished things that were worth while. That stirring was the work of the King—and the correspondents—but only the King had in mind that terrible probability of which he dared not speak. It swept thousands from the cheering ranks of workmen who greeted the King on that tour into the kilted battalions that poured out of Scotland for four years thereafter; it steadied shattered Scotland to the task of upbuilding when the carnage ended. It has defeated Bolshevik effort, backed by great expenditure, in Scotland ever since. Scotland has her Fascisti now, but their real leaders are the departed great of the land who are represented now by the great institutions which they inspired.

When next the King came to Scotland, he came in secret. Beatty's battle-cruisers had just chased the German fleet raiders, sinking the *Blucher*. At a blockhouse close to a siding near the great naval anchorage in the River Forth, a soldier was cheerily preparing breakfast. It was a chill, clear morning, such a morning as endows with all the charm of music the sizzle from the laden frying pan. He was at a critical stage of the operation when a civilian stopped at his elbow, and he didn't even glance up as he heard the query:

"Getting along all right? Feeding you well here?"

But his answer was prompt and tinged with enthusiasm: "Bet your (qualified) boots I am! This is the (qualified) life! Feeding—why, look at them (qualified) sausages! The stuff to give 'em!"

The stranger laughed. "That's good!" he commented; and strolled on.

Swift on his heels came an excited officer to have speech with the cook—lurid speech, mainly interrogatory. Where was his training? Didn't he know enough to stand to attention? and so on, and so on.

Why? Didn't he know that he had been speaking to the King? The cook lost all immediate interest in sausages while he racked his memory and placed in appalling line the adjectives he had just expended.

The King had come north to see the ships after the Dogger Bank scrap, and was camped in his coach in the siding. That was an exceptionally interesting morning. Things had been happening at that naval base. Officially they could not possibly happen, therefore officially they never did happen. Under the huge spans of the great Forth Bridge, the waterway was barred by steel nets, above which the ships anchored in safety from submarine attack. Under one span the netting was fixed; under the other, movable to permit of the passage of vessels when necessary. All night long, on the seaward stretch of the river, brilliant searchlights played upon the approaches to the spans. The story goes that the captain of a fleet collier or supply ship had come into the anchorage reporting that he had been followed up the estuary by a submarine which, with only the periscope showing, had taken its course from his ship. He was not absolutely certain, but, knowing that a submarine must submerge when it came within the searchlight zone, he had set his course straight for the permanent net until he was within the area of the lights himself, then swung at right angles and headed up and into the open waterway.

In any case, next morning the permanent net was sagging right out of sight in the center, proclaiming that some huge and heavy body was caught.

"A submarine, caught by the gills," said the sailors.

The King was among those who went over to have a look at the place before the divers went down. No story came out; but the little green-and-white buoy which marks a sunken wreck was swinging over something a little way down the channel of the river soon afterward.

The Big Russian Bluff

EVEN the siding in which the King's coach had been "parked" on that occasion might have told him a tale of a mighty bluff—if he did not know of it! We hear nowadays of "the myth of British unpreparedness for war." It is interesting hearing to the fellows who sat tight while the Germans pitched over fourteen shells to their one and sprayed the parapet edges with twenty machine guns to their one. Here is a story of "preparedness." The naval base at the Forth had its share of attention from the espionage agents of Germany in the early days of the war. To a railroad siding there, in those days, came a trainload of shells for the fighting ships. Shells protruded their grim snouts from the edges of tarpaulin covers in open wagons; big, terrible projectiles that must have interested an enemy. Then, every day for the better part of a week, trainloads of shells swept along the sidings and disappeared. North side, south side, round the docks and back again, one met always a trainload heading for the loading berths. What a satisfying sight they were to the friends of the fleet; what a dismaying evidence of power in reserve they must have conveyed to the agents of the enemy!

It was one of the best bluffs of the period. That single trainload must have traveled hundreds of miles around the railway sidings that fed the naval base! It was over that same Forth Bridge, it may be recalled, that "trainloads and trainloads of Russian troops" sped by night to the rescue of the Allied left wing in Flanders—or where was it they went, anyway?

Another British Intelligence Department bluff; the rumor that grew in such fertile soil that men were prepared to vouch for the men from whom they had had it as a fact that some sound fellows whom they knew to be unimpeachable had seen the snow on the Russian boots!

Balanced Rock of the Rio Dolores

By J. C. GILBERT

(C) The Denver and Rio Grande Western Railroad.

PICTURE a twelve-thousand-ton rock, eighty-five feet high and with a diameter of seventy feet, precariously balanced on two supports at the edge of a canyon. Add to this the bewildering impression that the huge mass is actually falling and you have outlined in your mind Potato Rock, located about twenty-five miles from Grand Junction, Colorado, on the Rio Chiquito (little) Dolores Canyon. For centuries the forces of erosion have worn away the supports of this huge formation of red sandstone, until now it is poised uncertainly at the edge of a precipice. The formation rests on two supports, one of which is no larger than a good-sized table and the other much smaller. It matters not from what angle the observer looks, the huge mass appears to be wholly unbalanced. Several highways and the Denver and Rio Grande Western Railroad pass through Grand Junction, from which point this remarkable trip can be made.

On Seeing for Oneself in Chihuahua, Mexico

General Arnulfo Gomez Speaks of the Fuse of Mexican Powder Keg—Closing of the Bridgehead

By MAX BENTLEY

"Obregon's favorite general," Arnulfo Gomez, commander of the Fifth Mexican Zone. Mentioned as a future president. He is only 33 years old.

OBREGON'S favorite general (Arnulfo Gomez is so regarded by government officials in Juarez) invites the world—and particularly the doubting Thomases from *los Unidos Estados*—to come to Chihuahua and see for themselves, with their very own eyes and under their very own noses, that peace in Mexico is no joke.

The State of Chihuahua was the fuse on the Mexican powder keg of 1916. Villa struck his heaviest blows at American interests in Chihuahua. Pershing's invasion was through Chihuahua—Colonia Dublan, his headquarters, and Parral, scene of the first engagement between American and Mexican troops on Mexican soil since 1847, are in Chihuahua. Most of the kidnapping-ransom parties have been staged by Chihuahua bandits. Lying so close to Texas, Chihuahua has been long regarded, from the American side, as the troublesome child in the Mexican family of states.

Indeed, not so very long ago it *was* unsafe for the American to venture far into Chihuahua without suitable escort. But that was in war time, and it was not President Obregon's fault. His program of pacification was not then achieved, and he was handicapped by the withholding of recognition from Washington. Banditry *was* a troublesome factor in the thinly populated gone-to-cactus frontier of Chihuahua lying nearest the Rio Grande.

It is not that way now. Mexico has been thoroughly pacified, and the Obregon régime is in every way regarded as "official" by our government. As for the frontier bandits, they have been scattered far and wide. Arnulfo Gomez did the scattering, so what he told me, at Juarez the other day, about Awakened Mexico, may safely be regarded as authentic.

Gomez is a division general commanding the Fifth zone, comprising the whole of Chihuahua state. He came to Juarez, it was commonly rumored, to be handy to the scene while President Obregon's personal envoy, Sr. R. C. Lecanda, stamped out gambling in the border city. The fact that that startling innovation went through as smooth as silk, that everybody in Juarez except Jorge Martinez, the concesionnaire, and the gamblers (mostly Americans), applauded the edict, is but another manifestation that Mexico is not as black as our jingo press insists on painting her.

It was significant that General Gomez came to Juarez only as an unofficial observer and without the trappings of arms. I did not find him at military headquarters, but in a pleasant sunny room of the Rio Bravo Hotel on Calle 16 de Septiembre. He was not in uniform, but in smartly cut whipcord "civies," with flowered vest and flowing tie. During our talk there was a stream of ramrod figures passing in and out, all of them obviously soldiers; and they, too, were in "civies." Gomez's tailor had given him a marvelous fit: he looked every inch a man of parts, with his broad shoulders, straight back and slender waistline. He has the small legs of the horseman, the slender hands and feet of what one usually calls the "average Mexican," great black eyes, shining black pompadour, and black *mustachios* curving smartly outward. Reverting to an understandable simile, he is a welterweight champion built to model: immaculate, fastidious, stout as an oak, and fiercely capable to the last inch of him. One sees that immediately.

"Chihuahua is as safe as Texas," he said. He spoke to me in Spanish; Sr. Gustavo Serrano, the Mexican boundary commissioner, had consented to act as interpreter. "In all our troubles," he added, "only 148 Americans are known to have met violent death in Mexico, or been kidnapped by bandits. Now, say since 1911, how many Mexicans have met violent death in, say, our neighbor Texas? This should be understood, that the killing of a Mexican in an American state is not of special concern to the American people and creates little disturbance. On the other hand, if an American meets a violent end in Mexico the incident becomes international and is made the source of much agitation among a certain class of your newspapers.

"Chihuahua"—the general's eyes twinkled here—"is safer than New York City. Money must be protected anywhere. An American—any citizen of any country—should apply for an escort if he intends carrying large sums of money into Mexico. But I can lend him two of my *bravo* soldiers and he will be safe in the loneliest corner of our wide frontier."

The cause of danger has been removed, the general said. It took heroic measures to clean Chihuahua of banditry springing up with and accompanying the recent Adolfo de la Huerta revolution, but Gomez applied them energetically. On the day that I interviewed the general the last bandit of consequence was parleying for amnesty—a disappointed, dispirited and broken malcontent. This was Hipolito Villa, brother of Francisco.

"In the past twenty days I have defeated Hipolito Villa fifteen times," General Gomez said. "Yesterday his last remnant of seventy men was routed in Los Nogales Canyon, Chihuahua, by Lieutenant Colonel Figueroa. Hipolito Villa has lost all his horses, including a $5,000 mare once ridden by his brother Francisco. A few days ago my men surprised and destroyed the force of Jesus Villanueva, Hipolito Villa's second in command."

General Gomez picked up a photograph and smiled on it lovingly before passing it to me. It was an enlarged snapshot. There were two adobe buildings and a background of cactus plants. There was a street in the foreground. In the center of the street was the figure of a man lying starkly on his back. General Gomez touched the recumbent figure lightly.

"Jesus Villanueva," he said.

Mexico held its presidential election last July. General Gomez remarked that not a single serious disorder was reported. He deprecatingly suggested a comparison with "your Chicago" and its election-day riots and murders.

"The population of our republic is fifteen million," he said. "In our presidential election we polled 1,600,000 votes." (Of these, 1,300,000 were for Plutarco Elias Calles, who becomes President of Mexico November 30.) "Mexico does not have equal suffrage. Our vote amounted to 10 per cent of our entire population. That means that nearly every adult male citizen voted."

"Did the soldiery vote?"

"Why, certainly," the general said. "I suspended military activities in the Fifth zone to allow such of my troops as were near their homes to go cast their ballots."

"How stable is the Mexican Government? Might the army overthrow it at will?"

"Absolute harmony prevails between the civil and military authorities," General Gomez answered. I noticed that he mentioned the civil authorities first. "The function of the army is only to sustain the civil authorities, and not to administer the laws passed by the Congress and the various state legislatures. Chihuahua is a large state, probably larger than any American state except Texas. The largest number of troops I have employed in Chihuahua has been five thousand."

He added that the outgoing governor, Reynoldo Talavera, and his successor-elect, J. A. Almeida, are civilians.

The anti-gambling edict at Juarez throws light on the character and strength of Mexico's present federal government. The Juarez gambling concession was in all things legal. It was granted to Jorge Martinez by the State of Chihuahua. A portion of his receipts went to the state as a tax. The tax amounted to several thousand pesos a day—and Chihuahua needs the money.

But President Obregon has always been sternly opposed to gambling. How might he put an end to the evil and still not trample on Chihuahua's authority in its own territory? To abrogate a legal concession would bring up the troublesome question of state's rights, and arbitrarily to close the gambling dives would require troops and surely produce internal complications.

The president met the situation brilliantly. He sent Mr. Lacanda to Juarez to take charge of Mexico's end of the international bridge. It has been the custom to keep the bridge open until nine o'clock at night to accommodate legitimate traffic passing between Juarez and El Paso. There was no way of stopping the bacchanalian horde of Americans, men and women, crossing from El Paso to Juarez to drink and gamble, except to make life hard for them. It is a depressing fact that Juarez's ninety-odd saloons (mostly owned by Americans) with their hundreds of catchpenny games, to say nothing of Jorge Martinez's gilt palace, could not operate without American patronage.

Mr. Lecanda simply moved up the bridge closing hour and announced that all visitors found on the Mexican side after closing would be required to remain there until the bridge was opened again—and he blandly was unable to say just when it *would* be opened again. It was further announced that all women visitors to Juarez would be required to show marriage certificates. The closing hour was made variable: seven o'clock one day, five o'clock another day, and each time early closing caught four or five hundred gamblers and drinkers tarrying on the Mexican side. Protests! threats! Lecanda and his federal guards at the bridgehead were courteous but firm. A few nights of this, and Jorge Martinez yielded to the pressure and closed his palace. He had been diplomatically but effectively frozen out.

The El Paso Chamber of Commerce, in protesting against the demoralizing effect of gambling at her gate, had the cordial support of the Juarez Chamber of Commerce. Indeed (bang! goes another cherished gringo conception of the "average Mexican"), sentiment in Juarez overwhelmingly supported the federal government. When Lecanda arrived organized labor was planning a large demonstration—parade, speeches and resolutions—against gambling. The bridge-closing strategy made that unnecessary.

Arnulfo Gomez, military commander of Chihuahua, soft-footed his way into Juarez and modestly remained in the Rio Bravo Hotel while a civilian Leonidas held the bridge. Gomez is young to be so discreet: a major-general and not yet thirty-three. His career is worth some attention. He was a boy of nineteen when he joined the Maderista movement against Porfirio Diaz, from his home state of Sonora. He enlisted as a private and by sheer brilliance came up through the grades of corporal, captain, lieutenant colonel, colonel, brigadier general, and, finally, division general. He was successively a Maderista, Carrancista and Obregonista, which explains his steady advances. Each time he has fought on the winning side. He was a captain at twenty-two and a colonel at twenty-four. His first big feat was his defeat of Francisco Villa. Then he was made chief of military operations in Michoacan, then sent to Tampico to subdue Manuel Palaez; and then, upon Obregon's accession, became chief of operations in the Mexican valley including the Mexico City zone. Besides being an able soldier and successful administrator, he is an authority on tactics. The successful general is the one that takes his place at the head of the column and leads the charge in person. General Gomez is that kind of leader—although, when I asked him to sketch his career, he touched only the routine points of his advancement.

"Say this for Mexico," he said. "Peace has returned and prosperity is returning. Industry has been resumed on a large scale. Communication of every character is normal. Foreign investment is being protected. Mexico wants the confidence and friendship of the United States and feels she is entitled to them."

Calle 16 de Septiembre, a business street of Juarez filled with saloons, most of which are owned by Americans.

Save the Forest!—The Red Man's Appeal

By JANE ZANE GORDON

JANE ZANE GORDON.
(Princess Who-Shon-No.)

THERE are at present in the United States approximately four hundred thousand Indians, who have, since the foundation of the present Federal Government, been regarded as wards of the nation. The rapid accretion of population throughout the United States is making such encroachments upon the territory or domain of the Republic that the Indian has no longer his former opportunity for expansion. While the natural increase of the Indian race is comparatively slow, it is quite necessary to anticipate the eventualities of the future.

The Indian has always lived in close contact with nature, and in the march of progress of this great nation the limitations placed upon this race have never permitted him to divorce himself from this intimacy. He loves nature in all its varied aspects. Even his primitive religion inspires him with the hope of enjoying the "happy hunting grounds" in the great beyond. The perpetuation of the woodlands in all their pristine beauty and charm means more to him than to any other race of the earth.

When the white man landed here he found the richest treasure of the world's storehouse of forestry, watered by perpetual streams. Instantly upon his arrival the white man instituted a decimation of the natural resources, and drove the Indian back from stage to stage to the unexplored frontiers. Today there is no frontier, and the Indian clings to the few remaining primitive environments which are his happiness and his hope.

There are no statistics which would indicate the original timbered resources of America, but sufficient is known to indicate that, beginning a century ago, there existed some eight hundred million acres of virgin forest. Since that time the encroachments of agriculture, the consumption of lumber for structural purposes and the ravages of fire, tornado, farm development and other agencies have reduced this area, until today the most reliable statistics indicate that we have left approximately one hundred and thirty-seven million acres of timberland.

Apparently the progressive white man has seemed unconscious of the destructive element in his own expanding civilization. He has shown a reckless disregard for the interest of his own succeeding generations. Barren waste, denuded hillsides, denatured deserts and mountain ranges stand today as a menace and a warning. Timid efforts are being made to replenish the rapidly exhausting timber resources, but the preservation of the national resources must necessarily be accepted as a task of individual citizenship, and not be made the subject of political caprice. A popular effort should be made to preserve these resources which are essential to every element of progress. The preservation of the forest means the perpetuation and safe control of the water courses and atmospheric moisture.

The generation of chemical elements for the enrichment of the soil is a well-known function of forestry. Without the forest there could be no storehouse for the moisture of the falling rains; no solvent for the release of the mineral elements in rocks and soils to stimulate plant growth; no impounding reservoir for the gradual distribution of moisture in the arroyos of the hills that replenish the exhausting fertility of the low plains.

The forest must be preserved. A natural and willing agency for this great work may be found in the Indian. He might be employed by the nation, the state, and the private owner of the soil in the great work of reforestation. The Indian is naturally adapted to this service, and being the nearest related to nature of all the human family, such a work would inspire his enthusiasm and prepare him to assume individual responsibilities to which he has been a stranger in the past.

An intelligent and forceful appeal ought to be made in this direction, not only to Congress, the state legislatures, and the political agencies of government, but to the captains of industry, the large landholders, and to the more numerous class of agriculturists who might utilize the Indian's services as a farm laborer to fill the ever-increasing scarcity of help which is today a menace to rural life.

The Indian has reached that degree of intellectual advancement that tells him he must be prepared to direct his own destiny, and he feels that his efforts in this direction should be unembarrassed by misguided enthusiasts or those wholly uninformed as to Indian ambitions.

Migrants Non-Stop Flight of 2,400 Miles

Concluded from page 3

sissippi Valley to their summer home in Northern Michigan, Wisconsin and Minnesota and Southern Canada. The autumn migration begins with a 1,000-mile trip almost due east to New England whence the coast is followed southwest to Florida.

The white-winged scoter breeds near fresh water in Canada, west of Hudson Bay. Then it travels 1,500 miles due east to Labrador, thence across the Gulf of St. Lawrence and follows the New England coast to its winter home which extends from Southwestern Maine to Chesapeake Bay with its center off Long Island. In spring the ducks return to their breeding ground by an inland route traversing the valleys of the Connecticut, Hudson and Ottawa rivers.

White-winged scoters that winter along the Pacific Coast from Washington to Southern California pass up and down the coast to and from the northwestern point of British Columbia where they apparently cross the 500-mile strip of mountains between the Pacific Coast and the Mackenzie Valley in a single flight.

The Ross snow goose, like many ducks, breeds on the Arctic islands north of Mackenzie. In the autumn it accompanies the ducks that are to winter on the coasts of the Eastern United States and the Gulf of Mexico as far as the northern boundary of the United States. Here the Ross snow goose parts company with its companions, crosses the Rocky Mountains and settles for the winter in California.

The western tanager has a unique northern migration route. From its winter home in Guatamala it enters the United States about April 20. It passes through New Mexico, Arizona, and Southern California, thence to Vancouver Island en route to Central Alberta, the van swinging as far southeast as Northern Colorado. It would be assumed the route to Alberta would be along the eastern slope of the Rocky Mountains. On the contrary, these tanagers coming by way of the Pacific Coast and British Columbia cross the main range of the Rockies about May 20 when they are partly covered with snow.

It may be safely stated that the weather in the winter home has nothing to do with starting birds on the spring migration, except in the case of a few, like some of the ducks and geese, which press northward as fast as open water appears. There is no appreciable change in temperature to warn the hundred or more species of our birds which visit South America in winter that it is time to migrate. It must be a force from within, a physiological change warning them of the approach of the breeding season, that impels them to spread their wings for the long flight.

Something besides sight guides these long-distance travelers in the upper air. Observers on ocean vessels traversing foggy regions have witnessed the passage of migratory birds flying as accurately as if they were guided by a compass.

Some authorities describe the power which carries migratory birds unerringly over ocean wastes and unknown land regions as a sense of direction. Human beings recognize in themselves the possession of some such sense though imperfect and frequently at fault. Doubtless a similar but vastly more acute sense of direction determines the course of the flight of migratory birds.

Most birds care for their young until old enough to look out for themselves, then molt and when the new feathers are grown start on their southward journey in their new suits of clothes. Birds that nest beyond the Arctic Circle have to begin their migration as soon as possible after the young are out of the nest and molt en route. Indeed, these Arctic breeders are so pressed for time that many of them do their courting en route, and arrive at the breeding grounds already paired and ready for nest building.

Various changes in plumage are presented by certain species during migration. The young golden plover are white-breasted as they fly over the Atlantic Ocean in the autumn. This has given place to jet black as they cross the Gulf of Mexico in the spring. The bobolink goes south in autumn obscurely marked with buff and olive; he returns the next spring in his well-known black and white. The scarlet tanager goes south in the autumn in a suit of greenish yellow and returns in striking black and scarlet.

Actual evidence seems to disprove the popular belief that birds find the ocean flights excessively wearisome and that after laboring with tired pinions across the watery wastes they sink exhausted on reaching the shore. The truth seems to be that endowed by nature with wonderful powers of aerial locomotion many birds under normal conditions not only cross the Gulf of Mexico at its widest point but even pass without pause over the low, swampy coastal plain to the higher territory beyond.

Jamestown, New York, Pays Its Own Way

Concluded from page 9

of the Jamestown program. Mr. Cawcroft has given his public associates the quality of legal service that is usually reserved for corporations that can afford to pay good retainers. However, like the others who have participated in the development of Jamestown's civic undertakings, Mr. Cawcroft has found it a zestful and satisfying experience. He is a director of the great Chautauqua which meets on the lake of that name a few miles from Jamestown.

The Saturday Night Club, of which Mr. Cawcroft is a leading spirit, maintains the traditions and influence of the New England town meeting in Jamestown.

With the stout-hearted support of the Saturday Night Club, Mayor Carlson maintained the constitutional right of free speech in Jamestown during the war. Many other cities permitted the ideals of John Hampden, Oliver Cromwell and Patrick Henry to be jettisoned during a war fought to make the world free for democracy.

Although opposed to the war in principle, Mayor Carlson became chairman of the local draft board and thereby reconciled many questioning persons to the realities of the situation. Soon after the end of the war, with ex-service men voting, the mayor was re-elected by one of his largest majorities.

It costs Jamestown less than three cents per capita a day to conduct its government. The city has the largest commercial production per capita of any city in the country, according to an authoritative research organization. Dr. M. J. Rosenau, of Harvard University, speaking of Mayor Carlson, said: "One of the joys of life is to meet men of inspiration and vision who at the same time dedicate themselves to practical service to their fellow men."

What Are a Man's Chances on a Newspaper?

Concluded from page 4

old dry goods box." Frank A. Munsey, whose career as a newspaper proprietor has been so spectacular, first appeared on the scene in 1891 when he purchased the paper called *The Star*. Mr. Munsey bought the New York *Herald*, then the *Sun*, merging them into one. Then he sold the combination to Mr. Reid of the *Tribune*. Now he owns only the *Sun*, issued as an evening paper, first started by Amos Cummings. Mr. Munsey is a bachelor, lives at the Ritz, and many stories are told about him. He is credited with millions, and undoubtedly is an able man, but, like a great many men who have been materially successful, he has always been under the delusion that he could write. I don't think he has ever written anything of the slightest originality or consequence. The story is told of him that when he visited Lord Northcliffe in London, he found that great newspaper proprietor propped up in bed in his hotel, where he received visitors.

Munsey's hero was Northcliffe, so when he came back to New York, he bought a bath robe like Northcliffe's and for two weeks sat up in bed at the Ritz and received callers. This is probably one of those stories invented by some man who didn't like Munsey, but it is rather characteristic.

Another story I can vouch for, however, was told me personally by Colonel Henry Watterson, one of the greatest editors in America, and always an inspiring editorial writer—a perfect example of a man who, by pure force of genius, had risen above his newspaper limitations, so that he was always able to write as he pleased. Colonel Watterson for many years had a reputation as a poker player. In fact, before I came to know him personally, the stories about his thrilling midnight poker games were a fixed part of my own mental picture of him. In referring to this reputation, I unwittingly stirred him up. He told me there wasn't a word of truth in it and that the false reputation thus achieved had been started by a young man on *Harper's Weekly* many years ago.

"I always like to help out young men," said Colonel Watterson, "and many years ago when I was on my way to Europe and stopped over at New York, I gave an interview to this young man on *Harper's Weekly*. He took liberties, and wrote me up as one of the great poker players. Of course, when the thing got started, nothing could stop it."

This incident is indicative of the number of newspaper reputations acquired by so many public men, which have small basis in fact. Our means of knowing what these men are, are derived almost wholly from newspaper reading. In nine cases out of ten the picture is distorted, and a slight incident may easily fix upon any man a reputation which is wholly false. In our estimates of public men derived from newspaper reading, we should, therefore, be careful and not judge them too severely by what we think we know of them.

In Mark Twain's posthumous biography which has just been issued by the Harpers he remarked:

"It is my settled policy to allow newspapers to make as many misstatements about me or my affairs as they like."

Mark Twain was sometimes a wise man and a philosopher.

Mt. Washington—a Place of Winter Outings

Concluded from page 10

feature. A great snow arch at the head of Tuckerman's Ravine often lingers there throughout the summer. It is the last evidence of the ice age whose glaciers carved these mighty embrasures in the ramparts of the range.

The view from the top of Mt. Washington extends to the ocean at Casco Bay near Portland and also to Portsmouth. Mt. Mansfield, the highest point in Vermont, is visible in the west, but the Adirondacks of New York State are obscured by intervening heights. The Sandwich and Franconia ranges are to the south and southwest, and northward there is a wilderness of low mountains, the sources of the Androscoggin and Connecticut rivers. The Saco River issues from the sides of Mt. Washington.

First-class roads encircle the Presidential Range and also penetrate to the various hotel communities. Trunk roads from Boston, Vermont, Quebec, and Maine make the White Mountains the most accessible of all the Appalachians.

There are many reasons why experienced visitors to the White Mountains are coming to favor winter vacations there. The air is more bracing and free from dust; the insects and the hot waves that sometimes occur at any summer resort are absent. The scenery is incomparably superior in winter. Everything is clear cut and without the haze that limits vision in the summer.

The Dartmouth Outing Club, of the famous college, was the pioneer New England winter sports' organization. Now winter outings have become so general that many White Mountain summer hotels are extending their season to include the winter months.

The Boston Chamber of Commerce took a special trainload of its members to the White Mountains the winter before last and gave the winter-vacation idea an impetus in the Hub. Last winter found more individuals and associations that formerly took their annual outings in the mountains or at the seashore in the summer going to the Christall Hills by the trainload. Switzerland and Scandinavia will soon be outdistanced as winter resorts by the various northern mountain regions of this country.

The Appalachian Mountain Club of Boston, the largest and oldest association of its kind in America, has performed a fine service for visitors to Mt. Washington and the rest of the White Mountains in building and maintaining hundreds of miles of fine, well-marked trails and also in operating a chain of shelter huts. Its guide to the White Mountains is the most complete work of its kind published in this country.

The A. M. C. has gone wide afield in its good works. Far up in Maine the trails over Mt. Katahdin were constructed and marked by it. It was the first to send climbing parties into the now-famous Canadian Rockies. Their present popularity was stimulated by the pioneer expeditions from Boston.

The forests of this region are chiefly in the hands of the Federal Government which purchased the land for the conservation of the headwaters of the principal New England rivers that have their sources and watersheds in the White Mountains. Scientific forestry is being practiced by Uncle Sam in an effort to overcome the ravages of the early lumbermen who almost destroyed the whole forest cover and dried up the stream flow of New England. Several years ago the situation was critical. The Forest Service has also taken over the maintenance of many trails originally located by the A. M. C.

A significant change is coming over the best caliber of sportsmen. They are taking up mountaineering instead of game slaughtering. They find in the new sort of outings more zest and bracing effort and fine memories than in killing off what little remains of the wild life of the continent. Men who have climbed mountains anywhere in the United States or Canada declare hunting is not in it for building up one's mettle. Climbing mountains is the finest sport in the world and destroys nothing.

For generations such a race of sportsmen as the British have accorded the mountain climber more honor than the lion, elephant and tiger hunter or pig sticker. Their present expedition to Mt. Everest in the Himalayas, the highest mountain on earth, is arousing more interest throughout the world than anything ever attempted in the way of animal slaughter. The men who have climbed the great Alaskan and Yukon mountains have a better right to distinction than the so-called sportsmen who are destroying the Alaskan brown bears, the largest American animal.

Mt. Washington does not require heroic endeavor to reach its crest. There are the carriage road and railway, the paths and trails with hotel comforts at the top for the summer visitors. The spectacular alpine method of midwinter yields the finest views and most stirring experiences although it is limited to those who can undertake anything so strenuous.

However, one does not have to climb Mt. Washington with ice ax and ice creepers to enjoy the new vogue for New England winter vacations. The valley hotels are comfortable, and snowshoeing, skiing and sleigh riding can be done without undue exposure or strain.

The wisest course, perhaps, would be to familiarize one's self with the White Mountains by motor or walking trip or a combination of them in the summer. A subsequent visit in the winter could be planned in the light of leisurely summer excursions to the many points of interest.

A Lesson in Labor From Far-away India

By WILLIAM PRESTON HILL, M.D., Ph.D.

AN AMERICAN tourist, recently in Calcutta, India, bought some small articles weighing about ten pounds which he wished to ship to the United States. He asked the merchant to send somebody to his hotel the next day to pack and address the bundle for shipment to America. He was surprised next morning to meet nine men who came to do the job. One man packed the box and sewed on the burlap; two men helped him, one on either side, to hold the corners; each one of these had an assistant standing by to relieve him if he grew weary or desired to go out; these assistants were apprentices learning the trade. Another man waited to paint the address and behind him stood his assistant carrying his little tin of paints (3 inches in diameter) and a palette 3 inches by 6 inches. Over all of these stood the foreman giving his orders and in addition there was a watchman whose business was to keep them from fighting and stealing. It took those nine men six hours to finish the job that one American packer could have accomplished easily in an hour.

It is no wonder, then, that wages in India are only a few cents a day. They produce almost nothing per man and therefore receive almost nothing as wages. Wages can only be paid out of production, and low production necessarily causes low wages. It costs about 75 cents to pack the box described above. But when this 75 cents has to be divided among nine men, each receives only a few cents for his labor. One man performing the service by himself in an hour could command five times as much in wages as the nine combined.

Now if we wished to elevate the condition of those workmen in India, the first thing we would have to do would be to educate and train one of the nine so that he could do that job by himself, say, in five hours. Then the employer could afford to pay him wages of one dollar a day which would be unprecedented for that country. The objection naturally arises that this would deprive the other eight of the job of doing almost nothing and receiving almost nothing as pay. And if we stopped at those particular eight it would be a hardship on them. But if we extended the process all over India it would be a different story.

Thousands of trained workers earning one dollar a day would soon have many wants. They would no longer be satisfied to go almost naked; they would want to protect their feet with sandals and their bodies from the scorching rays of the sun. Instead of having less than five dollars' worth of household goods to each family, as the average is now, they would want comfortable bedding and a few articles of convenient furniture. Instead of miserable hovels, they would desire a more comfortable habitation. Their purchasing power and wants would keep pace with their increased wages; an active demand would arise for all kinds of commodities and millions of workers would be kept busy at good wages in producing them. This in turn would necessitate better buildings, better factories, better transportation, better distribution and all the other facilities of what we call civilization. To produce all these things there would be an active demand for laborers of all kinds.

Workers who imagine that they can increase their wages by limiting production, sabotage and other destructive methods are as ignorant as the Hindus I have mentioned and are simply cheating themselves.

The opposite course of increasing production is the true way of prosperity. The man who discovers a way by which one man can do the work which now requires two will surely increase wages, and he will also increase employment.

What Is the Wittiest Saying?

Concluded from page 2

The application of the story of the prince of liars and of Scriptural authority to the don's own phrase raises this retort to the highest place.

What I regard as the third best is the following: Theodore Hook, a careless man in money affairs, had secured the post of treasurer in one of the Crown colonies. After a time it was discovered that the finances were in some disorder. Hook was suspended and was sent home under a species of "open arrest." At a calling place the ship was boarded by an acquaintance of Hook's, Lord Charles Somerset, who saw him with surprise.

"I hope," said Lord Charles, "you are not going home for your health, Mr. Hook?"

"Why," said Hook, "I'm sorry to say, my lord, that they do think there's something wrong with the chest."

Of all the strokes attributed to English wits, I think this is the best but one, because of the vivid contrast between the circumstances and the phrase which is so brilliantly fitted to them. It is the prince of all the Sheridan stories:

Sheridan had put his fortune into the Drury Lane Theater. One day in 1809 it caught fire. Sheridan, summoned to the scene, watched the conflagration until it became clear that the place was doomed. Then he wandered into a café opposite, ordered wine and sat sipping his liquor while he watched the destruction of his fortunes. There, a few minutes later, he was found by a party of his friends, who began to congratulate him on the serenity of spirit which such conduct showed. Thereupon Sheridan: "Surely a man may be allowed to take a glass of wine *by his own fireside.*"

At the head of the list I put the saying of a famous Frenchwoman of the eighteenth century. Lytton Strachey has told how Madam du Deffand held a splendid *salon,* where the wits and writers of the day sat round her in a semicircle and conversation flowed strong and brilliantly until the early morning hours.

On one occasion a bishop was discoursing on the wonderful miracle which attended the martyrdom in Paris of Saint Denis, who, it is recorded, when his head was struck off, picked it up and carried it in his hands. "The extraordinary thing," said the prelate impressively, "is not merely that the blessed saint picked up his head and carried it, but that he actually carried it all the way to the spot where his church now stands—not less than six miles."

"Ah, but, Monseigneur," said Madam du Deffand, "in a case of that kind, *ce n'est que le premier pas qui côute*"—"it's only the first step that really counts!"

Is there any authenticated saying of man or woman that better contains the essentials of wit than this swift and flashing use of a common phrase to point out solemnly that if the saint were able to make one step he would have no difficulty in making fifty thousand?

Others may have their own nominees for inclusion in the six. There was the House of Commons wit who brought confusion on the great Burke when, at the climax of a passionate oration, he flung a dagger on the floor of the House. "The gentleman," cried the interrupter, "has brought us the knife, but where is the fork?"

There is the story of Curran, the Irish lawyer, to whom the judge said, when a donkey brayed outside the court: "One at a time, Mr. Curran, if you please," and later, when the judge was summing up and the donkey brayed again, Curran arose and said, "Does not your lordship hear a remarkable echo in the court?"

There is the story also, in which no names are mentioned, of the officer who said, "If I were so unlucky as to have a fool for a son I should certainly make him a parson." Said a parson who was among those present: "You think differently, sir, from your father!"

There is the pretty story of Lord Chesterfield who, being a minister of the Crown, was told one morning by an alarmed official, "My lord, they're rising in Connaught." "Well, sir," said Chesterfield, "it's 9 o'clock and they ought to be."

Returning to the Old Route From Europe to America

By LOUIS C. KARPINSKI

THE route across Iceland and Greenland by the American aviators, Lieutenants Smith, Wade and Nelson, corresponds precisely to the path traversed some years before Columbus by the ancient Norsemen of whom the name Nelson indicates a descendant. The missions of Iceland long before Columbus have been established as an historical fact; European settlement began there in the ninth century. More recently the definite fact of settlements in Greenland in the tenth century and penetration later, but before Columbus, to the mainland of North America has been established beyond any reasonable question.

The ancient navigators were compelled to seek the route following the islands largely because their ships were operated without the aid of compass and it was necessary to keep in sight of land. The navigators of the air are restrained largely by the fuel difficulty as an airplane consumes in long flights such large amounts of gasoline.

Undoubtedly, too, the passage from America to Asia corresponds to a route known in ancient times from Asia to America by the Aleutian Islands which connect the Kamchatka Peninsula with Alaska.

Truth can be stranger than fiction. The first route to America, that of the Norsemen, may again be a common route by the air from the Old World to the New.

STATISTICS OF THE WORLD CIRCUIT

Flight started: 8:30 a. m. Sunday, April 6
Flight ended: 1:36 p. m. Sunday, September 29
Elapsed time: 5 months, 22 days
Flying time: 15 days, 6.71 hours
Distance covered: 27,500 miles
Average speed: Approximately 74 miles an hour
Motors: 400 horsepower, Liberty motor
Countries touched: twenty-one, twenty-five states and one territory
Stops: Fifty-seven hops, average 483 miles
Gasoline consumption: Approximately 7,200 gallons for each of the three planes, about 4 miles to the gallon
Oil consumption: Approximately 350 gallons for each plane
Longest jump: From Attu Island to Paramashiru Island in the Kuriles of Japan
World's records: First to cross the China Sea by airplane; first to circumnavigate the globe by airplane.

In a sense Walter Peary circumnavigated the globe by walking around the Pole in latitude 90° North when he discovered the North Pole. In a more precise sense a circumnavigation would necessarily cut the Equator which the world fliers did not do.

One of the World's Oldest Industries

Toilers of the Sea Have Their Seasons of Romance and Adventure

By VICTOR MITCHELL

AGRICULTURE and fishing are undoubtedly the world's two oldest industries. Fishing, if not the older, is in some parts of the world the more important. The harvest of the sea has from the earliest times attracted men of all lands. John Cabot, the discoverer of Newfoundland, came back to England with wonderful tales of the wealth to be found in those western waters, and in 1510 a vessel arrived at Rouen in France to sell fish caught in the "Terre Neuve." In 1522 the English Government stationed warships in the Channel to protect the fleets returning from the Newfoundland fishing banks, and about twenty years later an act was passed to encourage the industry and imposing a fine on merchants buying fish from France. It was "provided furthermore that this act or anything contained therein shall not extend to any person which shall buy any fisshe in any parts of Iseland, Scotlands, Orkeney, Shatlande; Ireland, or Newfoundland." Whatever results accrued from this measure of protection, there is no doubt the industry went on developing until it reached very large proportions, and it is today one of the main sources of food supply.

The most important fishing centers in Great Britain are Grimsby in England and Aberdeen in Scotland. It was from Aberdeen that the first King Edward got supplies of salt herrings for his troops when he was carrying fire and sword through the northern country during those years of English aggression which terminated with the battle of Bannockburn. A fleet of several hundreds of splendidly equipped steam trawlers now land their catches at Aberdeen, which is a convenient center not only for the famous fishing grounds of the North Sea, but for a much wider area. Taking supplies of ice with them, a number of these vessels make regular trips as far as Iceland, the Faroe Islands, and the White Sea in Northern Russia, and it is by no means rare for some of them to shape their course as far as Newfoundland, like their hardy predecessors of the early sixteenth century. These sturdy little vessels withstand the fiercest gales that blow, and the crews who man them fear nothing; for they are of the Viking blood. It is rumored that some of the most modern types of British fishing vessels may soon be seen on the Great Lakes.

The introduction of mechanical fishing equipment, and the consequent rich hauls that have been made, have materially affected the simple race of fisher folk which inhabit the villages scattered around the British coast. So highly organized has the industry become, and so much centralized in the larger ports, that some of the smaller places have almost been depopulated. There are still many little hamlets, however, that would serve Sir Walter Scott as models for the Mussel Crag of the "Antiquary," and fishermen with wives who would make excellent prototypes of the redoubtable Maggie Mucklebackit, peddling their flukes and haddies, just as Maggie did, and as stoutly maintaining their price. A table delicacy in many lands is the so-called finnan haddie, but comparatively few are aware of its origin. Most people think that the finnan haddie disports itself in the briny deep like any other fish, until it gets caught; but no such thing. The haddock—to give it its full name—does not become a "finnan" until it has been put through a process of salting and smoking that imparts the golden color and fine flavor so much appreciated by connoisseurs. The original finnan haddie came from the village of Findon (locally pronounced "Finnan") a few miles south of Aberdeen. Here unto this day this haddie, par excellence, is smoked over the peat fire on the domestic hearth. Green hardwood is sometimes used for smoking, but nothing can excel the peat reek for imparting the piquant flavor so highly esteemed. Closely resembling the haddock is the whiting, which is often smoked and cured in the same manner, only an expert being able to tell the difference. Carrying on their backs well-laden baskets, or "creels," the fisher wives and lassies used to trudge for miles selling their "yellow fish" to the people of the countryside; and, despising trains and motor buses, some of them continue to do so.

At one time the white, or haddock, fishing along the Scottish coast used to be pursued in yawls manned by a crew of some half-dozen men, and was carried on but a short distance from the land, so that a fresh supply could be brought in each day, and sold fresh out of the sea, or smoked; but now most of the yawls have been converted into motor boats, and the fishermen go much farther afield. The old method of catching with baited hook and line is still followed, and the fish thus procured are of superior quality, and bring higher prices than those captured by the nets of the trawlers. The curing of the fish brought in by the trawling fleet is extensively carried on by a number of firms in the larger seaports. It is the "finnan haddies" packed by these concerns that find their way abroad, those which are home-cured by the fisher wives being locally consumed.

Owing to modern methods of catching, curing and marketing fish, some of the village communities that have followed the sea for many generations are rapidly decaying, and with them there is dying out a race of men and women whose rugged endurance, uprightness and fearlessness have no equal. Typical examples of this may be found along the shores of the Moray Firth where harbors once crowded with fishing boats now accommodate only a scattered few. This is also due to the consolidation of the industry in centers where there is ample dock accommodation and means of transportation to the various markets. But another reason is found in the great increase in the size of fishing craft. Herring boats, for example, have grown so much in bulk that their draught has become greater than the depth of water in the harbors originally built for them.

A section of Aberdeen fish market when the morning's catch has been landed.

The Scottish herring-fishing industry is still the largest of its kind in the world, and in the proper season many hundreds of boats fish from Aberdeen, Fraserburgh, Peterhead, Wick, Lerwick—in the Shetlands—and Stornoway and Castlebay in the Hebrides. The herring fleet setting sail from one of these ports on a fine summer evening is a sight never to be forgotten. As boat after boat is cast off from its moorings, and falls into the procession bound seaward, the long line of sepia-colored sails filling to the breeze makes a striking picture, the leading boats mere specks in the distance, and the stragglers gathering way as they pass beyond the harbor bar. When the fishing grounds are reached, sails are lowered, and nets are shot into the sea, the boat meanwhile drifting with tide and current among the shoals of silvery fish. Some times the night's catch is an abundant one, at others, like the fishermen on the Sea of Galilee, the crews "toil all night and catch nothing." But some truly miraculous draughts of herrings have been got off these coasts. Nets have been hauled on board so filled with fish that boats have sunk to the gunwales, and—like the men of Galilee—assistance has had to be sought from neighboring crews. To see the nets being hauled is fascinating. There is no more beautiful fish than the herring when first taken from its native element. Their scales gleam iridescently, like myriads of opals, and as the fishes are cast into the boat they give vent to a faint, chirping death song which is weird in the extreme. In those northern waters sudden and violent storms occasionally overtake the herring fleet, and there is scarcely a family of fisher folk but has suffered the loss that follows in the wake of the tempest.

"Wha'll buy my caller herrin'—
Ye may ca' them vulgar farin';
Wives and mithers, maist despairin',
Ca' them lives o' men."

As boat after boat arrives in port in the early morning, the scene around the harbor becomes one of extreme animation. The fish are sold by auction, and soon the finny harvest is conveyed to the curing stations near at hand. Large numbers of winsome Scottish lassies, many of them Gaelic-speaking maidens from the Hebrides, are engaged to handle the fish and pack them in barrels. The pickled herrings are exported to all parts of the world. The principal markets, prior to the Great War, were in Russia and Germany, but, at the present rate of European trade revival, it will take many years for the commerce with these countries to reach its former proportions.

Cod fishing is another important branch of the industry along the Scottish coast, and in the Highlands and islands. Thousands of tons of cod are landed at Aberdeen and elsewhere every year, and the splitting, salting and drying of these fish employs a very large number of girls. It is mainly in pursuit of the cod fishing that so many of the trawlers make the long voyages to Iceland, the Faroes, the White Sea, and other distant points. Besides cod, the deep-sea boats bring in enormous quantities of halibut, plaice, and haddock, which, together with other kinds, are packed in boxes with ice and dispatched to the London market, where, especially during the Lenten season, there is a great demand. Billingsgate gets a large proportion of its supplies from Aberdeen, special fish trains being run.

Not only do hundreds of home boats land their catches at Aberdeen, but German craft with fish from the Iceland grounds also land their cargoes there. This state of affairs led to a strike of trawl fishermen in the beginning of last year, and riotous scenes ensued. The main grievance was that the Germans were able to bring fish from Iceland and sell them at a much lower rate than the local boats were able to compete with, owing to the unparalleled depreciation of the German mark. Even if a German got but half the usual price for his fish, the big difference in the exchange enabled him to carry home a very handsome profit. This trouble has been adjusted by a limitation of the German landings and other regulations of the traffic.

As indicated, the modern expansion of the fishing industry has had the effect of putting many old-time followers of the craft out of business; but there is still scattered along the coast of Scotland a fair remnant of this class. The Canadian Government has now a scheme on hand to settle a number of them on the islands along the British Columbian coast, and doubtless, with new hopes and ambitions opened up to them, they will make excellent colonists. These toilers of the sea have up to recent years been a people apart, retaining many primitive characteristics. The perilous and precarious nature of their vocation has endowed them with a strange mixture of religion and recklessness, and this latter characteristic is not surprising when it is remembered that in some instances they are descended from the bold buccaneers of a former age. Now and then a great wave of religious fervor passes over them, which recalls the old-time camp meetings on this side of the Atlantic.

Above—A group of Scottish lassies cleaning and splitting fish for salting and smoking. Below—Unloading fish from steam trawlers at Aberdeen.

The bravery and endurance of these fishermen were put to the test during the late war when thousands, having perforce to abandon their peaceful calling, went as mine sweepers, crews of patrol boats, or joined the naval reserve. Manning their cockleshells of fishing craft they seemed afraid of nothing short of a dreadnought. There is the example of the steam fishing boat *Gowanlea*, of Fraserburg, which exchanged shot for shot from her tiny quick-firer with a big Austrian cruiser in the Adriatic—a pigmy tackling a giant, and getting away with it, although the diminutive vessel and her crew emerged from the scrap in a somewhat battered condition.

Face to face with Nature in all her moods, fishermen throughout the world are a courageous and self-reliant class.

BRIEFLY TOLD

"Free education is offered to all who will listen in on the radio. Professor Robert Emmons Rogers of the Massachusetts Institute of Technology is radiocasting from station WBZ, Boston, a series of eight lectures on American literature every Monday evening between 7:30 and 8:00 p. m. Eastern Standard Time. The course is offered by the Division of University Extension of the State of Massachusetts. Certificates will be awarded to those who finish the course and pass the written tests. Anyone anywhere within the reach of the radio voice of WBZ is eligible."

Bohemians fail to understand what gay artists and writers mean by "bohemian" as descriptive of a way of living. Real Bohemians say that the custom is due to the mistake of identifying Bohemians with gypsies.

"I never saw Bonaparte," said the Duke of Wellington, "though he was once, during the Battle of Waterloo, within a quarter of a mile of me. The day was dark—there was a good deal of rain in the air."

The Apache Indian of Arizona is a highway builder, using stone as he did a half-century ago. Many of the state's most scenic highways were made by Apache labor. The Apache is not a government charge, having left the reservation nearly twenty years ago.

One kilowatt hour of electrical energy will perform the following duties: Drive a sewing machine for 20 hours, clean 15 steel table knives for a year, clip 5 horses or 25 sheep and churn 440 pounds of butter.

The Roman Emperor Nero never executed certain persons incurring his disfavor. He merely told them to put themselves out of his way. A man with a death warrant in his hand would go to the public baths and, immersing himself in the "tepidarium" bath, permit a skilled physician to open the veins in his arms. While bleeding slowly and comparatively painlessly to death, he would converse cheerfully with his friends.

If thou takest a wife, let her be more contented than any of her fellow citizens. She will be attached to thee doubly, if her chain is pleasant. Do not repel her; grant that which pleases her; it is to her contentment that she appreciates thy direction.—Precepts of Ptah-Hotep, about 2500 B. C.

Real silver is said to be "hall marked." The term comes from the Company Hall of the Guild of Gold and Silversmiths, of London, where, six hundred years ago, gold and silver articles began to be assayed and marked with a stamp that vouched for their being genuine.

Every voter in New York State who became qualified to cast a ballot after January 1, 1922, by the attainment of his majority, naturalization or having moved into the state, must, before he can vote, have either a certificate showing he has graduated from the eighth grade or a certificate of literacy.

The largest clam bed in the United States lies off the southwest coast of Florida in the region of the Thousand Islands. It covers an area of 150 square miles, but there are very few clam fishermen, because there is little demand for the clams in that section.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

In a three-cent cake of yeast, it has been estimated that there are twenty-two times as many yeast cells as there are people in the entire world.

Fines collected from blaspheming miners, who agreed to stop swearing and to fine themselves if they broke their promise, have paid for a handsome clubhouse opened recently at Newbrancepeth, a Durham colliery village.

"Be not arrogant because of that which thou knowest; deal with the ignorant as with the learned; for the barriers of art are not closed, no artist being in possession of the perfection to which he should aspire."—From the Precepts of Ptah-Hotep, the oldest book yet discovered.

An Illinois law forbids the selling or buying of trillium, gentian, lady slippers, columbine, bloodroot and lotus.

Prohibition is likely to result in the sale of the Middlesex County Jail in Lowell, Massachusetts. The building will probably be sold and the money turned into the county treasury.

"We offered to fly the ZR-3 to the United States and back to Germany and then fly her back once more for delivery all at our own risk. We made this offer because we knew the efficiency and the great cruising ability of our ships and we believed that the transatlantic flight of the ZR-3 would justify us in saying that airships were safe means of transportation."—*Dr. Hugo Eckener,* commander of the ZR-3.

A St. Louis, Missouri, man claims to have found a cure for hay fever by "resorting" on top of a St. Louis skyscraper. He remained in the building for five weeks never going below the tenth floor.

Former Premier Clemenceau of France has presented to the city museum of Versailles the ring with which he sealed the Treaty of Versailles in 1919. The ring was also used by the foreign minister Favre when he signed the treaty with Germany in 1871, because Bismarck was unwilling to wait until the state seal was brought from Paris to Versailles.

Newcastle, England, was the birthplace of the first railroad. It was here that George Stephenson was born and conceived the idea of a locomotive to take the place of animals. It was also in the region of this town that coal was first mined.

London, with a slightly larger population but approximately the same area as New York, has nearly twice the number of police. London has 21,019 while New York has 12,917.

There are 25,000 miles of concrete road in the United States. California has 3,288 miles, the largest mileage of any state in the Union.

Mrs. Herbert Sheets, who lives in Quinton, New Jersey, has cooked on the same stove her husband gave her when they were married sixty-one years ago, on Washington's Birthday, 1863. Since that time she figures that she has prepared 67,000 meals for her family.

The largest lemon grove in the world is located near Santa Paula, California.

Hallowe'en, like Candlemas Day, and May Day, had its origin among the Druids, who at the time of Caesar's invasion of England taught their pagan religion, performed weird ceremonies, and offered human sacrifices in their temples in the north of the island.

If the present standard of living continues, the maximum number of inhabitants the earth can support will be reached in 300 years. America's limit is about 600,000,000 people.

A species of worms which lives only in ice and cannot live when the ice around them melts has been discovered by a scientific expedition in the Olympic Mountains. What they live on is a mystery, and although they have been photographed it is impossible to get any of them out of the mountains alive.

A foundation for the continuing of the work of Cecil Sharpe, who devoted his life to the preservation and revivication of the folk songs of England, has been established. He left a valuable library relating to old music dances and folklore which it is hoped will be made accessible to the public.

Ancient Egyptian noblemen speared fish in much the same manner as do Americans today. The Egyptian lord would sit in his boat while his wife or son paddled him about over the fish. The spear handle was tied to the wrist and the weapon was thrown at the fish.

The Kensington Rune Stone, one of the oldest records in American history, was discovered near Kensington, Minnesota, and appears to be very ancient in character. The assumption of the scientists who have been puzzling over its genuineness is that it was inscribed and left here by the Norsemen who were exploring this country as early as the year 1362.

The "Almanac de Gotha," which is published in Germany and is a Who's Who of royalty, contains in the new edition only one line referring to the Romanoff family of Russia. Before the war six pages were insufficient for the annals of that family.

Spruce, fir and pine lumber are being exported from Sweden to the United States.

Fox raising is becoming one of the most important industries of Southeastern Alaska, where many fox farms have been started. One of the largest is near Ketchikan.

Why Hearst Hired Elbert Hubbard; A Cartoon That Enraged Pulitzer; The Origin of the "Publicity Man"; Newspapers a "Nervous Habit"

By THOMAS L. MASSON

Preceding articles by Mr. Masson on the subject of newspapers appeared in the issues of October 18 and November 22.

IN PREVIOUS papers I dealt with the appalling waste of reading matter in the newspapers, the salaries paid, whether journalism can be considered a profession, the editorial page, and some matters of history. In the present paper I shall conclude with some personal reminiscences.

My friend, Roy L. McCardell, who is connected with the New York *Morning Telegraph,* and knows as much about newspapers as any man I know, some months ago, wrote an article for the *Saturday Evening Post,* in which he traced the rise of the press agent and the effect of this individual upon the so-called profession of journalism. As I was somewhat responsible for the incubation of the press agent, I will briefly tell the story of his first appearance, as far as I know.

Enter the Publicity Agent

BACK in 1912-1913, C. S. Mellen was president of the New York, New Haven and Hartford Railroad Company, and I was the acting editor of *Life,* the humorous weekly. I was obliged to use this railroad one summer, I think the summer of 1912, and was impressed with the poor management of the road. It happened that about this time a series of bad accidents confirmed my opinion. I thereupon started a campaign in *Life* under the general head of "Mellen's School of Courtesy" taking as a keynote the former Mr. Vanderbilt's celebrated saying, "The Public Be Damned." Securing the services of several artists, we managed to link up Mr. Mellen's personality with death heads. Among other pleasing bits was a long poem entitled "The Road That Vanderbilt," illustrated by E. W. Kemble, showing how the engineer was always to blame when a lot of people were killed. Mr. Mellen was quite naturally furious, and tried in every way possible to get us to stop. A rumor that his resignation would follow got into the papers, who now took up the hue and cry and from this on came the decline in the stock of the road and Mr. Mellen's final exit from the management. This was the culmination of the muckraking era, in which the celebrated, if not notorious, Thomas Lawson, in his "Frenzied Finance" and other articles in magazines had raked over so many corporations.

One of the first publicity agents to be appointed was a friend of mine who secured a position with the New Haven road. Thereafter it became his business, immediately following any criticism, to deal with it, still further following this up with publicity material. So effective was this method discovered to be, that since that time the press agent, or publicity agent, has grown to enormous proportions, and it is not too much to say that the business of getting one's self represented in the newspapers, whether it be an individual or a corporation, has been reduced to an almost absolute science. This, coupled with the power of advertising, undoubtedly constitutes a menace, as far as the actual truth is concerned.

When we consider that the newspapers, taken as a whole, are filled up with various propaganda, with "features," a large proportion of which are not only in the worst possible taste, but are crude and ugly and, with crime and frank indecency, it will be seen that the poor reader, in search of the actual news, is very much like a visitor to a crystal maze. At the same time it must be remembered that all readers themselves become very expert, not only leaping from headline to headline, but also ferreting out the particular news or items they want with the skill and precision of a Harlem goat in an open field of garbage.

What Are the Best Papers?

FURTHERMORE, and in defense of the papers, it must also be noted that in the best of them, throughout the year, there is published some of the most notable of the best current literature. In this fact lies a certain danger, for it tends to make the mass of people lean too exclusively upon the newspapers for all their reading, thus separating them almost entirely from classic sources. It is undoubtedly true that most of the current literature of the present day is but a very thin dilution of the great masters, who lie too often forgotten on dusty shelves.

What are the best papers? In 1921, a Southern editor, Greenville Talbott, polled a substantial number of newspaper offices in various parts of the country to get their votes and views as to those daily papers in America which would best assist him in interpreting the events of the day. The result was as follows:

New York *World.* Public service.
New York *Times.* News.
Boston *Evening Transcript.* Dramatic and literary.
Ohio *State Journal.* Editorial paragraphs.
New York *Sun.* Features and human interest.
New York *Tribune.* Typographical display.
St. Louis *Dispatch.* Use of art.
Christian Science Monitor. Ethics.
Atchison *Globe.* Personals.
Chicago *Tribune.* Merchandising and advertising.

Since this list was compiled the New York *Sun* has become an evening paper and the *Tribune* has become consolidated with the *Herald,* Ogden Reid having bought that paper from Mr. Munsey. Otherwise this list holds good for today, although the old Springfield *Republican,* which has just celebrated its hundredth anniversary, might well be added. Also the Kansas City *Star.*

Under the direction of Herbert Swope, the New York *World* has endeavored to emulate the example of the old *Sun* under Charles A. Dana, by adding to its staff a group of so-called "bright young men," although, as a matter of fact, some of them are not so young after all. Thus the *World* now has Heywood Broun, Franklin P. Adams, Laurance Stallings, Walter Lippmann (who conducts the editorial page), and more recently Will Rogers and Burton Rascoe. All this is, in a definite sense, carrying out the idea of the elder Pulitzer, who always insisted on getting the best men. Joseph Pulitzer purchased the New York *World* from Jay Gould in 1883. He is popularly supposed to be the founder of yellow journalism, yet it was not until the advent of Mr. Hearst in New York in 1896 that this term became so well defined. To secure large circulation, Pulitzer adopted the rule of stooping to conquer.

The "Garbage Wagon" Cartoon

ONE cartoon in *Life* exasperated him greatly. It was drawn by F. A. Richards, since deceased, and represented Mr. Pulitzer as the driver of a garbage wagon, while all the bystanders were holding their noses.

It happened that at this time some original material of mine had found its way into the *World* office, and the Sunday editor took great glee in publishing it in driblets, week after week, with my name attached as one of his most prominent contributors. Pulitzer's son Ralph was, I understood, going to Harvard at the time, and it was unpleasant to have his father pictured as the driver of a garbage wagon. Harvard in those days was not so common as it has since become (to paraphrase a well-known saying of Henry James about a certain hotel), it now being run "for the exclusiveness of the masses."

The really lively period, and the beginning of the yellow journalism of a later day, began with Mr. Hearst's appearance in New York in 1896. Hearst proceeded at once to engage all the ablest men he could lay hands on, at salaries much above what they were receiving. He thus took away a number of men from the *World* and the *Sun.* I recall quite vividly meeting one day the poet and humorist, R. K. Munkitterick, who had just taken a job with Hearst. He smiled when I condoled with him and replied:

Cockroaches at $75 a Month

"WHY even the cockroaches in the American office get seventy-five dollars a month."

Joseph Pulitzer was in a sense the most brilliant newspaper proprietor and editor we have had, but he was unbalanced and in his later years, when he became blind and conducted his vast properties from his yacht, his selfishness undoubtedly grew upon him. His blindness made him suspicious, and the extraordinary precautions he took to defend himself against possible fraud are pathetic in their extent. He had the Jewish idealism well developed, but it is in my opinion doubtful if, after all, his accomplishments have resulted in anything permanently beneficial either to art or to letters.

The fact is that all great editors are overestimated.

The aftermath of the Pulitzer-Hearst era is now seen to be gigantic aggregations of commercialized "news" which, while they may indeed be a reflection of the national consciousness, do little to raise the standards of character, and fasten upon the whole American people a nervous habit which, from the mental point of view, is almost if not quite as bad as the cigaret habit from the physical. Countless American citizens, every night and morning, pick up their newspapers and inhale them mentally, satisfying a morbid craving for something which is of no earthly consequence in itself, and which merely makes a void where there might be genuine substance.

A New School of News Writers

OWING to the enormous expense of production, the number of newspapers is undoubtedly decreasing, and I believe that, as the pressure of material grows, there will eventually come a revulsion of feeling and a new school of news writers will evolve who will interpret the events of the day from some fresh angle.

The most that can be said of Hearst and Pulitzer, taken as a whole, is that they have been largely instrumental in flooding the country with typography of an extremely doubtful nature. Mr. Hearst is by far our most astute newspaper proprietor. He draws and keeps very able men, and looking only for results his methods are wholly impersonal. The story is told that Elbert Hubbard, who formerly published the *Philistine* and who went down in the *Titanic,* "roasted" Hearst so hard that the latter was attracted to his writings and straightway employed him at a large salary.

Of the three most notable newspaper proprietors and editors who have appeared in this country within the past quarter-century—two of whom are still with us—namely, Joseph Pulitzer, W. R. Hearst and Adolph Ochs, Mr. Ochs is by far the ablest one, taking into consideration all factors.

A Newspaper Without a Murder

IF WE sweep aside all religious distinctions, regarding only method, Mr. Ochs's paper, the New York *Times,* may be regarded in much the same light as the ancient Jewish Sanhedrin, which was presided over by seventy-one members. In this instance, of course, Adolph Ochs himself is the "main guy." We have only to recall the Jewish ritual, which, of all the rituals of the world, is the most minute, to understand that, if the same ability which can comprehend all the minutiae of such a ritual is applied to the conduct of a great paper, what the result is certain to be. We see here rabbinical idealism and rabbinical technique united for the purpose of producing the most intricate and highly successful commercial news factory of the day, founded upon the idea that decency pays and that completeness of news reports, at whatever cost, after all yield the most lasting profits. It is the volume of advertising, of course, which makes such enormous production possible.

Whenever we lean too far in one direction, some one steps in, so to speak, with a counterirritant. The gradual growth of such vast aggregations of typography represented by the big metropolitan journals has therefore been accompanied by the daily illustrated newspaper in which the reader is fed with a series of badly printed reproductions of photographs "taken on the spot." So ignorant are some of the photographers, that a friend of mine who "knows" society is frequently called upon to supply the names of the prominent people photographed. In New York, J. Medill Patterson, of the Chicago *Tribune,* I believe was the backer of the *Daily News,* a tabloid paper which has achieved an enormous circulation, and which was started in New York some three or four years ago. More recently, Mr. Hearst has been competing with the *Mirror,* built on the same lines. Young Cornelius Vanderbilt, Jr., with an earnest and wholly laudable desire to produce something pictorially clean, on September 3, 1923, started the Los Angeles *Illustrated News,* which was an immediate success. Later he followed with the San Francisco *Illustrated Herald,* his idea being to continue probably in Detroit with a third, and eventually to establish a chain of illustrated newspapers, papers which can be read by families without infection. The great profits of the New York *Times,* the success of Mr. Vanderbilt's papers and the widespread vogue of the *Christian Science Monitor,* would seem to indicate that a large proportion of the American people are ready to encourage decency.

A story told me by a Christian Scientist the other day is rather interesting. He said there was a wealthy man in New York who had a very bright boy. This boy devoured the papers which were delivered at the house every day; but noticing that they had a bad influence over him, the father tried the experiment of replacing them with the *Monitor.* At the end of the third day when the father came home the boy greeted him with:

"Say, Pop, what's the matter? There hasn't been a murder this week."

Twelve Hundred Foreign Language Papers

DURING the war the question as to how much the foreign-language press should be encouraged in this country was largely discussed. It has recently been estimated that there are in America nearly, if not quite, ten million illiterates, that is, people grown who cannot read nor write. How many there are among the foreign-born who can read or write only in their own language is not known. There are, however, in this country approximately 1,200 papers published in foreign languages. Among these there are 244 German papers, 111 Italian, 168 French, 150 Spanish, 77 Czecho-Slovak, 52 Norwegian and Danish and 43 Yiddish. There is one Assyrian paper, published at Yonkers, New York. Including Honolulu and other possessions of ours, there are 17 Chinese papers. The fact that these foreign papers undoubtedly derive a large part of their support from those who prefer to read them rather than to learn to read English is undoubtedly a matter for consideration. Before making too drastic a change, however, it would doubtless be well for us, as a matter of national pride, first to see that our ten million illiterates are taught how to read and write.

Near or Real Conservation for Our Game?

The Question the Sportsmen of This Country Must Answer

By WILLARD G. VAN NAME

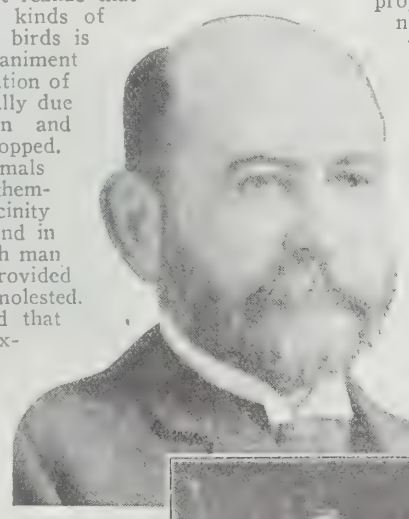
This marshy lake produces waterfowl, fish and fur. Drained at best the land would be no better than adjoining territory which is only good for pasturage.

STATISTICS collected by Dr. William T. Hornaday and published by the Permanent Wild Life Protection Fund (P. O. Address, Stamford, Connecticut), show that in the twenty-seven states for which full records were available, the number of licensed hunters increased 195 per cent during the period 1911 to 1922. In other parts of the United States a corresponding increase in the number of hunters has undoubtedly taken place.

In 1922, statistics show 4,495,007 persons took out licenses to hunt in the United States, and at a low estimate more than a million others hunted without licenses, either legally or illegally. Even if these killed only five birds or animals apiece *in the whole season*, this means a destruction of more than 25,000,000 birds and animals annually, besides those succumbing to other causes.

In view of such facts can we dismiss as a baseless alarmist opinion Dr. Hornaday's warning that the end of sport with gun and rifle in this country is rapidly approaching? Can shutting our eyes to the truth have any other result than to hasten that end?

There is nothing in which complete honesty and a square facing of the real facts is more imperatively demanded than in conservation work. We can deceive ourselves, but we cannot deceive nature! Fake "conservation"; protective laws which do not protect, or which are not enforced; game reservations which exist chiefly on paper, and similar makeshifts devised to get conservation without giving anything for it, these are what the American people have too often been satisfied with. We have trifled with game protection. We have let political, private and local interests block it, and we have shut our eyes to the fact that we are falling behind in the race with extermination.



First of all we must realize that the extinction of most kinds of our native animals and birds is not a necessary accompaniment of the increase of population of our country, but is usually due to needless persecution and neglect which can be stopped. Most of our wild animals and birds will adapt themselves to life in the vicinity of human habitations, and in the new conditions which man has brought about, provided they are not too much molested. We need to understand that the way to prevent the extermination of a game bird or animal is *not to let it get rare.* We must apply enough protective measures *while it is still common* and widely distributed, to keep it so. Every year the odds against all our wild creatures become greater. No amount of argument, no amount of testimony (some of it doubtless true), that game of certain kinds has increased in certain localities, can alter the fact that taking the country as a whole, our game birds and animals are diminishing not only in numbers, but what is even more significant, in the extent of the country over which they range.

No better proof of this is needed than the increasingly long list of species for which the state laws allow "no open season," because they are too near extinction. In Colorado, for instance, the present law allows no open season for the following:

> "Elk, antelope, sheep, does, fawns, abort, black or tufted-eared squirrel, quail (bobwhite and crested), pheasant, dove (1930); sage chicken (1926); doe, partridge, ptarmigan, wild turkey, swans, wood duck, eider ducks, bitterns, little brown, sandhill, and whooping cranes; grebes, gulls, herons, jaegers, loons, band-tailed pigeon, terns, and all shore birds (except Wilson snipe or jacksnipe, black-bellied or golden plovers, and yellowlegs)." (Extract from U. S. Dept. of Agriculture, Farmer's Bulletin No. 1444, p. 8.)

Are such laws passed in a land where game is increasing? The other states also have lists of game now entirely protected as far as legal killing is concerned. Does not this bear out Dr. Hornaday's warning that as far as our game is concerned we are like one who is consuming more than his income, and using up his capital?

We cannot escape the fact that destruction by man is the important factor that has brought the wild life of this country into its present desperate situation. Blaming it on other causes is merely trying to deceive ourselves. The sportsmen have got to kill less game, or they will soon be killing none at all. If we do not shorten open seasons, and reduce bag limits to what the reproductive powers of the game can stand, nature will soon impose her own closed season which will last all the year for every year, and her own bag limit; and we all know what that will be.

In attempting to remedy the situation the main difficulties to be contended with are inertia, procrastination and the usual habit of government bureaus and officials in this country of postponing action until it is too late to be effective.

The average sportsman does not realize how much his own interest is affected, nor feel any personal responsibility. He thinks that if he observes the state and Federal laws he has done his full duty, and he leaves the determination of what laws may be necessary to the officials charged with that task. That is just where the minority of hunters, the game butchers who think of nothing but the gratification of their lust for unlimited killing and who secretly, if not openly, resent all restrictions on it (and too often violate them when they dare), get their innings. We are not governed by majorities in this country, but by small minorities who get together and clamor for what they want until they get it.

The game butchers expect the game to last out their lifetime, and say that "posterity never did anything" for them. They interest themselves actively in game protection matters—in obstructing any new measure, however important, that will restrict their own slaughtering propensities, and in trying to break down the effectiveness of existing laws. They make more noise than the vastly greater majority of reasonable sportsmen, with the result that their clamor is listened to by legislators, and by state and Federal officials who fear their influence and votes. They have learned to their cost that the majority of sportsmen are usually too inert, too careless and too unorganized to stand by the officials who resist wastefulness.

It is to waking up this strong but inactive majority to a realization of its own interests and its own power, that Dr. Hornaday is now directing his efforts. Changes in the existing laws and bag limits are needed in very many cases and localities, but those that it is important to make at once are those that will most promptly and effectively put an end to the excessive slaughter of migratory game birds which is taking place in those states where these birds still occur in considerable numbers. Twenty-nine states have bag limits equal to the limits prescribed by the Federal law, which they are not permitted to exceed. To secure the reduction of these limits by amendment of the state laws would be a slow, and sometimes, owing to local opposition, a difficult process, but by reducing the Federal bag limits it could be done promptly and effectively for the whole country.

Though in the last half-dozen years there has been a very great increase in the number of hunters *no change whatever has been made in the bag limits allowed by the Federal migratory bird law except the backward step of increasing from 25 to 75 the daily limit of birds of the rail family that a hunter may kill.*

The authority and consequently the final responsibility for fixing bag limits on migratory game rests with the Secretary of Agriculture, but he is naturally guided in such matters by the recommendations of the Chief of the Biological Survey and of the Migratory Bird Treaty Act Advisory Board. The latter is composed largely of state officials and others regarded as authorities on game protection.

As a result of the do-nothing-until-it-is-too-late policy which has prevailed in this department—the same policy that has caused the extinction of the wild pigeon, and has brought a number of others of our native birds and animals where extinction within a few years is now inevitable—reductions in bag limits for the present shooting season were refused, and probably millions of ducks. geese and other wild fowl that will be badly needed next summer for breeding purposes will be sacrificed this hunting season, not for any justifiable sport or for any necessary use for food. It is simply to indulge the lust for killing possessed by certain people that it is impossible to designate by any term as complimentary as pot-hunter, since no useful purpose is any important motive in their slaughter of game. No man or no family can actually use twenty-five ducks, eight wild geese or eight brant in one day, or day after day, and there is no sense in allowing any man to kill more than he and his family can possibly use merely on the supposition that he gives it away.

The result of the excessive and wasteful bag limits allowed by the Federal law is that no less than twenty-nine states, including nearly all those where ducks are most plentiful, allow the killing of the full Federal limit of twenty-five a day throughout the open season, while those states which have reduced the bag limit very much below this are chiefly those where ducks have become so few that one would rarely be able to make a large bag anyway. This is a fine example of "conservation" on paper, as we are accustomed to practice it in this country. Little of it where it is needed, and plenty of it where it cannot interfere with destroying anything!

The Permanent Wild Life Protection Fund has not been alone in endeavoring to arouse the Department of Agriculture to action. The National Conference on Outdoor Recreation, which convened at Washington on May 22-24, 1924, at the call of President Coolidge, unanimously adopted the following resolution, its adoption having been moved by John B. Burnham, chairman of the Migratory Bird Treaty Act Advisory Board, and president of the American Game Protective Association:

> WHEREAS, Many destructive influences now are operating to diminish and exterminate game birds, mammals and fishes in the United States and Alaska; and among the most destructive of these are too liberal killing privileges, the decrease of hunting grounds, and the rapid increase of hunters, now be it
>
> RESOLVED, That the Federal and State Governments are hereby called upon, and urgently requested, to take such steps as may be necessary to secure promptly reductions in bag limits and open seasons, which will reduce the annual volume of game killing, both migratory and non-migratory, by large amounts where necessary.

A Sunday morning duck shoot on the Suisum Marshes on San Francisco Bay. Above—W. T. HORNADAY, leader in the Nation-Wide Movement to Reduce Bag Limits and Open Seasons.

There is another feature of the present situation of which the sportsmen may well take notice. The protection of our game birds and animals has been left in their charge, they being regarded as the ones chiefly interested in it. But the poor work they are making of the task is attracting the notice of the constantly increasing multitude of our citizens who are interested in some branch of nature study, and have come to love to see and study the lives of our wild neighbors without harming them.

That these are resenting more and more the killing, wounding and persecution to the point of extermination of these beautiful and interesting creatures merely for the amusement of certain people, is becoming increasingly evident. The time when people holding such views will outnumber the sportsmen may not be as far away as many of the latter suppose. If the sportsmen cannot give a better account of themselves in preserving our game than they have thus far, they may find it difficult to prevent the work being taken out of their control.

Mexican Skilled Craftsman Centuries Ago

The church of the "Lord of the Village," to whom in child-like faith the Indian brings his troubles and his griefs. At right —A squat god, whose memory the Indian conserves in the pattern of his vivid blankets

Mexico's Children Reached High Civilization When Their Spanish Conquerors Were Savages

By HELEN BOWYER

The psychology of the Indian forms the main theme of Helen Bowyer's second article.

WE HAVE said that they are Indian. Of the less than fifteen million inhabitants of the Republic of Mexico, probably not a million are of pure Spanish descent. Of the remainder, seven million have never had a drop of the white man's blood in their veins, while in the veins of the other seven the vast current of the native blood far outswells the thin rivulet from the three hundred thousand colonists, more or less, who, strung out through the three centuries of Spanish rule, contributed the only other strain worth noting that went to the making of the mixed breed.

So they are Indian, this mass of eight million children and youth who form the rising generation in Mexico. How will the fact of their race affect the destiny of these children—and ours?—for with the inevitable tightening of the world bond, the destiny of our children is bound up with theirs.

What does it mean to be Indian? Ten years from now, if all goes well, we may know more of the answer to that question than we know now. For in Mexico and Central America there are studies in progress that may give undreamed-of revelations not only as to the Indian but as to the whole past history of man. What reason have we for being dogmatic as to the precise locality where the human race first arose? Suppose it should have been on our own continent? In the jungle lands of Guatamala and Southern Mexico, the Carnegie Foundation has gone to uncover the remains of a civilization that leads back and back, perhaps, to ages when the Nile was yet untrod of man. But even if it stops short of that, even if it but supplements and rounds out things already known, it will rouse again our wonder at this red man who built his palaces and temples at a time as far back as the Golden Age of Greece, when the Latin who later enslaved him was unknown.

Beyond all question, the Indian is more unlike us than is any other race, and in the Anglo-Saxon civilization we are spreading through the earth, we are going to need, and need desperately, all the harmless unlikeness that we can conserve.

Mexico is the only big stretch of the world now left that is or ever can be Indian. There may be more red men outside the republic than within its borders but those outside are scattered thinly over a vast continent in which other racial dominance is crowding the Indian to ultimate extinction. Even the Mexican census of 1920 shows a net decrease of population for the republic of more than 4 per cent—and the chances are that this census understates the loss.

What sort of being is this Indian who is so unlike us and yet who may be such an asset in our world in the days even now at hand?

In the first place the Indian of Mexico is not the native of our own frontier traditions, living by hunting and the trap. For centuries, perhaps millenniums, before the Spaniard came, he was a tiller of the soil, a craftsman, a trader, and such he is today. Nor is he a warrior like our Iroquois. He will fight, of course, for the things he holds worth while. But left to himself no one is more peaceable, more gentle, more kindly disposed to all men. And above all the Indian, whether pure blood or dark *mestizo,* is not the lying, treacherous, back-stabbing villain of the movie or the border romance. There is treachery and lying and back-stabbing enough among them as there is among ourselves—probably more, proportionately—but beyond the border, as this side of it, life moves through the whole range of simple human feelings with good will and good faith as the requirements of any human intercourse at all.

The Indian of Mexico is a lover of his own locality. Of *country,* of the *great republic* to which he pays his *contribuciónes,* taxes, he knows nothing—not the eleven or twelve million of him who make up the pure bloods and the more primitive mixed breeds. But to his *tierra,* the little isolated homeland of village and surrounding fields in which his life took root, he feels a filial devotion that has in it something of infinite beauty, a beauty we have almost lost among the pavements and apartments of our ever-growing towns. To plant his frijoles and his maize in the little patch of ground where his father and his father's father planted theirs, to honor his saints and virgins in the ancient pink-washed church where they worshiped, and to sleep at length with them in the same little *panteon* with its wooden crosses leaning all awry—there is no state of life within his understanding for which he would exchange these satisfactions of his soul. And there is no reason for his ever being asked to make an exchange. Given health service and rural sanitation, given the length of life, the energy and hopefulness they bring in their train, what a paradise might he not make of that little, loved *tierra,* with its thatched and pyramided roofs, like a picture of the South Sea Islands and the blue line of the hills around it like the circle some giant magician had drawn round an enchanted spot.

Allied to his love of his *tierra* is his love of the soil itself.

He is, moreover, an artist-craftsman who pursues his art-craft as a necessary part of life. All the clothing, all the simple utensils and implements he uses, he makes, perforce, by hand, and into them, as an integral part of their outline, their pattern, he weaves and carves and molds a beauty, an authentic beauty, that makes art *per se,* "art for art's sake," meaningless and unreal. He is still kin to the red clay of his water jars, the reeds that grow beneath his fingers into baskets, the bit of bone that comes from his knife a rosary of his Lady of the Remedies or of his Holy Child. All the long, long history of his race—of which, in words, he could give you not one fact—lives in the squat gods woven in his vivid blankets, in the clay figures of those steeds, so gloriously caparisoned by

Temple the Indian built to his gods when the Latin who later enslaved him was a savage in the wilds of Spain.

which the Spaniards overthrew those gods, and in the feather-wrought picture of the snake-devouring eagle that became his country's emblem when it fought free from Spain.

The Mexican Indian is, besides, a singer, a maker of songs, of wild songs, of lovely songs, of eerie and blood-curdling songs—of songs that rise to God and Virgin, of songs that deal with witch and demon, of songs to woo a lover and hush a babe to sleep. And above all of *corridos,* ballads, song stories, improvised, word and music on the spot, by some primitive troubadour, caught up by another, changed and added to as inspiration seizes or words slip out of mind, growing till each crystallizes in a half-dozen versions deep within the hearts of a singing peasantry.

Often these *corridos,* these ballads of the people, gather round their heroes or their villains, their Maderos and Huertas, their Zapatas and their Villas, their martyrs, their bandits, their Robin Hoods. But only as they are *men* do they gather round them—not as they were makers or unmakers of a nation—round their bravado, their coolness or their cunning, round their dangers, their escapes, their deaths, round all those vivid, concrete things that so grip untutored souls—and that so grip our own.

If, as solemn voices throughout our country warn us, religion is another essential of any society worth the name of human, then the Indian of Mexico has this indispensable, has it profoundly, has it in every fiber of his life. God is no abstraction to him; He is the "Lord of the Village" to whose altar in some crumbling, brick-floored sanctuary he drags a broken limb to be healed, or hangs the tiny image of some burro which has strayed and must be found. And to Mary "tender Mother of the Mexicans" he puts up a *voto* beneath the organ loft, in memory of the time she cleared him of false accusation, or led him safely past the cliff edge that dark night when he had drunk too much. And when, on the road he returns your salutation with his "Good day, senorita, may you go with God," it is no mere stereotyped greeting he is giving—he is *really* commending you to the care of the Deity in whom he never doubts your faith to be as fervent and as childlike as his own.

And he commends you to the Deity not only because he is *Cristiano,* but also because he is affectionate and kind. If there is any way in which he himself can contribute to your care, your well-being, even your passing pleasure, nothing could afford him greater gratification. Do you exclaim over the flowers he has gathered down the road—and already so artistically arranged—"Take them, senorita, they are yours." Do you stop a little later to beg a cup of water from the barefoot mistress of some adobe hut, she will not stop her ministrations with the drink cool from her porous jar. Surely you are weary, should rest a little while. "Enter, enter, *niña,* here you have your own house." Is there some other Indian, some relative, some friend, some stranger, even, who is in want or in trouble, even though it be from his own fault. *"Pobrecito,* poor fellow," wells up from the Mexican heart, and as long as there is a scrap of tortilla dough upon the kneading stone or a mat to spread at night upon the floor, they are there for the unfortunate to share.

Springing, perhaps, from this fundamental affectionateness, the Indian manifests a charm, a grace of manner that throws a glamour over all the rounds of daily life. His speech alone is an enchantment. The tongue the Spaniard imposed upon him was already rich in courtliness, in polish, in phrases that appealed—the Indian took it, softened it with a thousand diminutives, a thousand expressions of deference and endearment and breathed in it the singing quality that differentiates the Spanish of Mexico from, for instance, the Spanish of Chile, where the red man is almost extinct. We could not so use any language, we have not the time nor the naïveté—but what a vacation it affords from the fine, efficient, workaday directness of our Anglo-Saxon speech.

We have all of us been enslaved, those of us who trace our blood back to the British Isles no less than the rest of us. The Romans enslaved our fathers, then the pirates from Anglia and Saxonland, then the Danes. Then William the Norman and his barons and upon our fathers' necks they trod as ruthlessly as Cortes and his *hidalgos* trod upon the Indians'. Is there any depth of contempt the Spaniard held for Montezuma's people that the Norman did not hold for us "Saxon swine"? Was there any depth of degradation to which we did not sink beneath the lash, the dungeon, the priestcraft and the serfdom of our foreign lords? Yet today the world is ours.

We need not carry the parallel so far as to suppose it will ever be the Indians'. Perhaps his day is past. Perhaps the day of all other peoples now existent is past or can never come as it came to Assyria, Greece, Rome, Carthage and to us. Perhaps the world is ours for ages, for a very long, long time. If so, we shall need the other peoples, and most of all, it may be, we shall need the Indian.

The country has had a troubled past, for hundreds of years it has been torn by internal strife, but—against extinction by the mere population pressure of white men—or black—Nature seems to have safeguarded the *indigene* of Mexico. Only in the jungles of the Gulf Coast could the Negro find that habitat where he flourishes en masse and while anywhere, through the beautiful country, from the cocoa palms of Vera Cruz to the snows of Popocatapetl the white man can direct his enterprises, can reside for months, even for years, it is perhaps only the Indian who can *people* those sun-flooded altitudes beyond the Rio Grande. And even he, it may be, can only continue to do it if we come to his assistance.

These are a few of the more obvious qualities of the Mexican Indian, the things that even the most casual eye can see. Are they worth conserving in a world coming inevitably under the standardization of a mechanical civilization? Are they worth developing, bringing to their highest levels in the eight million boys and girls who will make the Mexico of tomorrow?

It is for us to say.

New Mohammedanism's World-Wide Appeal

Turkey Assembling the Forces of Education and Industrial Organization; Children of the Prophet Are Gradually Shaping the Destinies of Empires

By THOMAS CAMERON TAYLOR

THE great Mohammedan territorial arch that sweeps from Equatorial West Africa to the heart of India, with Turkey as its keystone, includes five areas within which active warfare has been in progress of late. The reports of war operations at widely separated points of the Mohammedan realms have been read in some quarters as an expression of the reawakened spirit of Islam and an indication that the new Mohammedanism is to be even as the old—a fighting faith. Apart from the fact that at the great Mohammedan conference at Mecca last year the decision was in favor of Mohammedan organization as an economic and political force, there is the possibility of the observer being obsessed by the Mohammedan tradition. At that conference, there was frank recognition that tradition may become more of an obsession than an inspiration, especially such a tradition of conquest as is the heritage of the Mohammedan: that memories of greatness bring down no bombing airplanes.

And the Children of the Prophet have a great tradition indeed. Thirteen hundred and forty-three years ago, Mohammedanism blazed up in the Middle East and swept half the world. Spain was conquered in 713—the First Crusade came three hundred years later—and Mohammedanism hewed its way north through France to the line of the Loire, where the battle of Tours marked the first great check to the initial impulse of the warrior faith; but more than seven hundred years passed before the capture of Granada in 1490 brought the end of the Moorish kingdom in Spain. In that first surge of Mohammedanism, much-conquered Egypt had gone down again, the inhabitants (except some of the Coptic Christians who came to terms) being forcibly converted to Mohammedanism, expelled or massacred; all North Africa from the Nile west to the Atlantic seaboard had embraced the new faith; and from Arabia to India the Sword of Islam ruled.

Turkey as the Keystone

THE Moslem tide ebbed slowly for seven centuries, and no less slowly the lessons of the ebb came home to the Mohammedan mind, for only during the past decade, and only as the result of the intensive education conferred upon the Moslem races by the Christian peoples in the Great War, has there come the realization that a fighting faith and dauntless legions are not enough.

Turkey represents the fact that at last the Moslem world has learned the lesson of the centuries, and the keystone of the Mohammedan arch is to be a center of strength indeed to the whole structure if the aims of the new Turkish state are to be carried out. To envisage Turkey as assembling the best that the world can supply her with in education, in scientific equipment, in industrial organization for the independent production of the needs of a modern state; as a source of supply and strength to all parts of the great Mohammedan realm under all conditions in time to come—is to see Turkey as her present rulers see her, and to give pause to the tendency to view her efforts with a patronizing smile.

It is too early yet to weigh the Turkish rulers and find them wanting, and to declare them ill-advised in that, while enjoying huge military and diplomatic prestige, they seem suddenly to have relinquished the country's historic place at the head of Islam and to be shedding restrictions in a manner which will drive a wedge between them and the large mass of the orthodox Mohammedan peoples. Turkey has been laughed at on the strength of an outside declaration that in her blindness she has voluntarily altered her status from that of the head and front of Islam to that of a comparatively small state in Asia Minor. There is much interesting recent history to confirm the fact that blindness can never be associated with the modern Turk; and it may be noted, as a fact of importance in any present view of Turkey's policy, that the British King took the first opportunity, after the setting up of the new Turkish régime, to extend to it with marked cordiality a most friendly hand.

When Roosevelt Stopped Raisuli

REGARDING Turkey as the geographical heart of the Mohammedan world, and taking account of her resources and her ambition to achieve in education, in scientific development, in capacity to produce for peace or war, a position of independence, it is not difficult to accept the view that despite any temporary differences with orthodox Mohammedanism there may not be far distant the time when the whole Mohammedan world will turn to her inevitably as the leader and chief source of Mohammedan strength. She put her faith in princes aforetime, and had many promises of greatness by the help of the military power and instruments of war provided by other lands. They failed her. Latterly, she made cynical use of them all: German supplies against Britain, French supplies against Greece, Bolshevik supplies against Greece and almost against France, too.

Turkey is bent on upbuilding now a new center of world power, which shall possess ultimately the ability to meet the other nations on equal terms in scientific and social attainment and productive capacity for all purposes, and there is much to stimulate her ambition, for she holds a great place in Mohammedan history and constitutes an unrivaled center of the huge tract of practically unbroken Moslem territory which contains the 220,000,000 followers of the Prophet.

While it is remarkable that there should be so much fighting in progress in Mohammedan countries, and that so much of it is directed against Christian races, there are local and definite causes of hostility which remove the operations from any connection with broad Mohammedan policy. In the case of the war against Spain in North Africa, for example, there is reason to believe that it could have been ended long ago if the Spanish forces had been animated by the war spirit, and conditions at home and in the field had been conducive to action of firm character. War is the pastime of the forces opposing the troops of Spain; a game to be played wherever it may be played without consequences too grim. It was played on the Barbary coasts for years, till the nests of the pirates were smoked out. It was played against America until that day when, by cable, America was forever removed from the list of the nations that might be played with. Raisuli had seized an American subject. There was a long record of shipping seizures and hindrances and delays over there. Roosevelt cabled: "We want Pericardis alive or Raisuli dead." Evidence of some such force behind the troops of Spain would end the war play in that part of North Africa, it is believed.

> **This article is confined to the bare information obtained by a qualified observer from the surest sources, whose opinion is that in the matter of trade Turkey is worthy the prompt and close attention of America to a greater extent than obtains at present.**

The French are not finding much resistance to their operations in Morocco, and, indeed, any resistance encountered would require to be of important character before it became the subject of news reports; but there have been considerable departures of Arabs from French spheres of influence in North Africa during recent years, the Arabs claiming that they must be denationalized before they are accorded any rights under the administration. The point is alluded to as indicative of the nationalist feeling which is strengthening in Arab countries, and which has had recent active outlet in part of Trans-Jordania, where there has been sharp conflict and considerable loss of life. It is not to the benefit of settled peace conditions in the Middle East that the emergence of definite nationalist aspirations in the Arab countries should coincide with the conflict between Zionist aspirations in Palestine and the population-facts of that country. The position has contributed to the unifying of Arab feeling, however, and to the furtherance of the new Mohammedanism.

The God of Public Service

FIGHTING in the Sudan is reported, but it will be found that the trouble there is nationalism rather than aggressive Mohammedanism. When the Mahdi raised the Green Banner and drove the Egyptian administration from the Sudan, he was prepared to wipe out Egyptians, Turks, British, Germans, and everybody connected with a rule which the Sudan had found to be oppressive, corrupt, and of insatiate greed. He drew to himself the great ivory caravans of the Sudan which had been ruined by the Egyptian Government making of the ivory trade a monopoly. These caravans were joined by the slave-trading caravans, whose grievance was that the slave trade was being suppressed. The Mahdi united them and the people, and the fighting Dervish wiped out the Egyptian troops wherever they were met with. Egypt abandoned the Sudan for eleven years, but in those years the British were busy in Lower Egypt "making riflemen out of mud," and in due time, with British forces at their elbow, they helped to reconquer the Sudan, where the Egyptian and British flags have flown side by side ever since. As in Lower Egypt, so in the Sudan, the British have raised the only monuments built since the Arab conquest in the seventh century: monuments to the god Public Service, to the fame of an ideal of public welfare—the great irrigation works that have removed Egypt's misery. The Sudan is prospering amazingly, and free Egypt wants it all for itself now. It says so with frankness. It expresses fears that the British might some day cut down Egypt's share of the Nile waters. A greater fear may be that the riches of the Sudan, natural and cultivated, may flow increasingly southward through the British Colony of Kenya with which the Sudan merges indeterminately. In any case, the two flags are still flying there, and the British have stated that theirs is not coming down. Some of the Egyptian troops and agents there think differently. It is not a matter of Mohammedanism as such, meantime, it would appear.

Another Mohammedan land in which there has been recent fighting is Afghanistan, and, significantly enough, the news comes from Moscow. Before the British washed their hands of Afghanistan, they specifically charged the Moscow exponents of Bolshevism with anti-British activities there, and the charge was one which Ramsay MacDonald definitely hurled at Russia's representatives. On the whole, Soviet Russia has followed consistently a policy of conciliation in respect to all the Mohammedan countries in which she found pliant rulers. The treaty with Turkey marked the initiation of that policy, and in the districts and dependencies where her own population is Mohammedan—Russia has about 6,000,000 Moslems in her territories—the Bolsheviks have not forced matters, and there has been nothing resembling the crushing processes applied to the Christian regions. There have been reports for some time that the Amir of Afghanistan had developed, as a free ruler, characteristics of independence. With Afghanistan's freedom, however, power to import arms and ammunition through India was cut off. Russia became the new source of such supplies, and these seem to have got into the hands of a very large number of persons who are not in agreement with the Amir and in touch with Russian trade sources. The fighting which has taken place in Afghanistan, it is suggested, may also be ruled out as due in any way to a stirring of Mohammedanism.

Advancing the Banners of Islam

THE new Mohammedanism as a policy is based on the conviction that Mohammedanism as a religion is quite safe; that its spiritual content is adequate; that its power to advance by virtue of its inherent appeal is amply proved by the progress it is making throughout the world. To that progress testimony is especially offered by its spread in the frontier provinces of the Russian empire, in the equatorial regions of Africa, in India and in China. It is almost impossible to obtain accurate figures except perhaps in the case of India, where the children of the Prophet number 70,000,000, fanatics in a land of fanatics.

The most remarkable advance of Mohammedanism has been that made in China, and it continues no less remarkably. The Moslem estimate is that there are now 9,000,000 Mohammedans in China.

In Africa, north of the Equator, the number may be put at nearly 50,000,000.

"We are increasing everywhere. We hear of no decrease." So they said at Mecca last year. With this assurance that the Mohammedan faith is capable of flourishing wherever it has taken root, attention has turned to the place which Mohammedans hold in the political and economic structure of the great empires.

"The British have an Empire in West Africa which is held by a few White officers and some thousands of Mohammedan troops."

"The French have an Empire in North Africa which Mohammedans are helping them to hold against themselves."

"Mohammedan soldiers are assisting the British to hold India."

"Egypt and the Sudan, and parts of the British Empire in East Africa, are held by Mohammedan soldiers."

"The White traders of the world have brought in the fighting Mohammedan everywhere for use in their wars."

"Our laborers are toiling in all parts of the East for strangers."

"We could stop the trade of the world if our people knew that through them it could be done."

That is but an earnest of the talk that has gone on since the war in thousands of far-scattered centers. The Mohammedan may be slightly incoherent yet, but he is awake.

A Rich Field to Develop

IN THE light of what those selected quotations from an important report convey, the line now taken by Turkey assumes a definiteness and essential soundness which apparently the British were prompt to recognize. Among other things, the conference at Mecca declared for "the complete freedom of all Arab countries," but it resulted in something even more important than that declaration, for it opened up means of disseminating information, education, and unifying purpose throughout all the wide realm of Mohammedanism. A center whence such education could continuously pour was necessary, and Turkey, the natural center of the Mohammedan world, has set itself to the work.

The affiliations of Turkey place within her reach wide lands containing the richest resources of the world. To her, with careful handling, may be brought the friendly aid of more than 200,000,000 people, to their mutual advantage as they are increasingly assured. There is no greater anxiety in the mind of the responsible Turk in these days than that he may be left alone to educate, to organize for production, to develop on modern lines until he can look the modern world squarely in the face and without troubling to play off one jealous group of powers against another.

When Canada's Parliament Starts Its Business

Old-World Pageantry Features Beginning of Federal Session at Ottawa

By T. M. VESEY

COSTUME and ritual might well be described as the bow and stern anchors of British constitutional practice, and twice a year—at the opening and at the prorogation of Parliament—Ottawa is edified by the magnificent and impressive spectacle of Canada's Governor-General and statesmen nobly upholding British tradition.

These two annual ceremonials have more than a mere political significance, for they mark the opening and closing respectively of "the season" in the Canadian capital. So "the boast of heraldry and the pomp of power" are well in evidence on these occasions, and everybody "who is anybody" in Ottawa may be seen making for Parliament Hill—especially for the opening. And curiously enough, practically everybody in Ottawa *is* somebody. This collective and individual prestige of almost the entire city population is a most wonderful phenomenon.

Perhaps in no other capital in the world is there such a singular dearth of nonentities as in Ottawa: no Toms, Dicks, and Harrys, no *hoi polloi*, ragtag and bobtail, proletariat or tatterdemalion horde—in short, no "masses." At least, a stranger might be pardoned for gathering that impression. Everyone not only seems to have a local habitation and a name, but contrives to get it into the newspapers. There is nothing essentially snobbish about this, though. Indeed, it makes for as really sociable a "social set" as is to be found anywhere.

Interior of House of Commons, Ottawa, Canada.

The opening of Parliament is looked forward to eagerly by nearly all the residents of the city. During the week or so preceding it members and ministers and judges of the supreme court and all the sessional *entourage* descend upon the capital in ones, in twos and in half-dozens, and establish themselves as comfortably as possible for the three or four months of their stay.

The opening ceremony—which never varies—is interesting, if only as a survival, for it is modeled on that in use at Westminster. At a few minutes to three in the afternoon there comes to the ears of those assembled on Parliament Hill—in the Senate, the Commons and out on the open, snow-covered ground—the distant boom of a single field gun. The vice-regal party has left Rideau Hall, the official residence of Canada's Governor-General.

Governor-General Baron Byng of Vimy (farthest from the camera).

A moment later the Gentleman Usher of the Black Rod, dressed in his somewhat somber yet striking habiliments—he looks all black and silver and buckles—is to be seen on the steps of the House, beside the humble but useful Dominion police constable whose duty it is to open the doors of conveyances.

Everything is timed to take place "on the dot." At exactly three o'clock the mounted military escort sweeps down the curving drive. This escort is supplied by the Princess Louise Dragoon Guards, and two outriders, bearing lances from the glittering heads of which flutter tiny red and white pennons, precede the main body of troops.

The Governor-General, unless the weather is too inclement, uses an open sleigh, such as is seen a good deal during the winter season in the streets of Ottawa. It is a rather picturesque and Russian-looking vehicle, with its plenitude of buffalo robes and its coachman and footman in great fur capes and headdress not unlike the bearskin of the English Guards.

Lord Byng, who commanded the Canadian Corps in the war, always wears the uniform of a British general, with its feathered, cocked hat. Alighting, he takes his stand on the steps of the Parliament house and faces the gathered multitude and the drawn-up guard of honor. The quietude is abruptly broken by a sharp word of command, the metallic clash of the "present," and the military band blaring forth the opening bars of "God Save the King." The Governor-General stands at the salute, the soldiers at attention, and the onlookers with bared heads. Simultaneously with the ceasing of the music comes the crash of artillery close by, and to the accompaniment of a salute of nineteen guns Lord Byng is ushered into the Senate.

Prime Minister, Rt. Hon. William Lyon MacKenzie King.

The really gorgeous part of the ceremony of the opening of Parliament takes place in the famous Red Chamber, the Canadian Senate. Here is a brilliant assemblage indeed: statesmen in the black and gold of Windsor uniforms, headquarters staff officers booted and spurred and sabred and beribboned, naval staffs in handsome cocked hats, pillars of the hierarchy in rich purple, foreign consuls in all their ambassadorial regalia, judges in scarlet and ermine, and, last but by no means least resplendent, the beauty and feminine fashion of the capital—for the ladies are there in force.

The Senate Chamber has recently been redecorated, and is itself a blaze of red and gold, while a new canopy of gold and maroon has been erected. It is in this chamber that the Speech from the Throne is read by His Excellency.

The Speakers both of the House of Commons and of the Senate now wear for the occasion knee breeches, silk stockings and buckled shoes, just as at Westminster, except for the absence of the wig. It seems there is an etiquette in these things, for apparently the wig would not be *de rigeur* in the Dominion—or else the omission of it is a mark of Progress with a capital P.

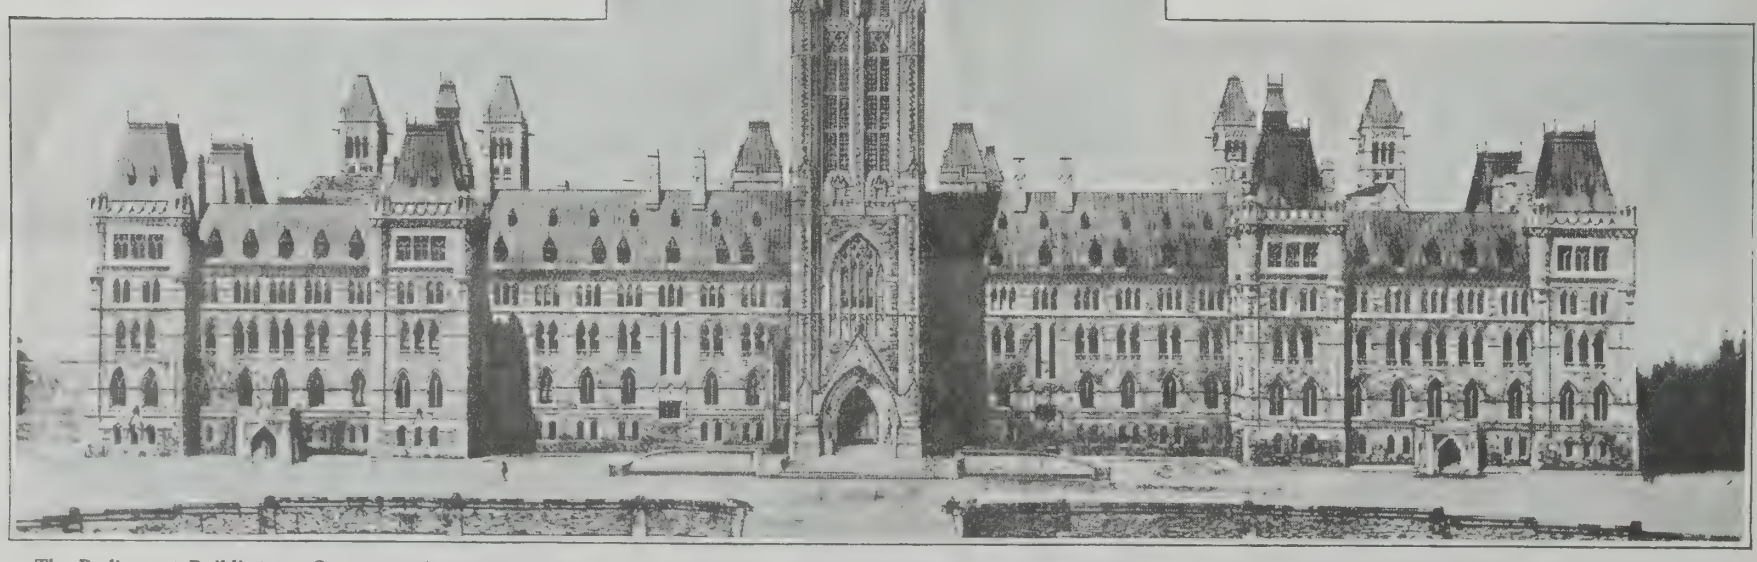
Before the Governor-General arrives the members of the House of Commons assemble in their own chamber, there to await the sonorous summons of the Black Rod. A knocking heralds this high dignitary's advent, and a voice, which desires "the immediate attendance of this honorable House in the chamber of the honorable, the Senate." Then the members, headed by the Sergeant-at-Arms carrying the mace, and preceded also by the Speaker, file down the corridor to the Senate, there to listen to the Speech from the Throne, which, of course, forecasts to some extent the probable legislative efforts of the coming session.

The members then return to their own legitimate sphere, and after new members are introduced the Prime Minister rises with the first bill of the session. This is just a blank piece of paper termed "a bill respecting the administration of the oaths of office," and it is in its first and last stage for the session. But it is not exactly a joke, this blank piece of paper called a parliamentary bill. It has, on the contrary, considerable serious significance, and is a historic document, in a sense. The idea behind it is that at the opening of every session of every Parliament the Commons has to assert its right to consider its own business before taking up the Crown's business as originating in the speech from the throne; hence the "bill respecting oaths."

It might seem a somewhat cumbersome method of re-establishing a right which never is and probably nevermore will be questioned; but after all it is something of an interlude, and the members have, for the nonce, nothing of more import to occupy their minds, since real business does not start until the beginning of the ensuing week.

As far as the spectacle outside the buildings is concerned, the whole thing is over in a few moments, but it is quite impressive while it lasts. There is a strong smell of cordite on the air, and the crowd vanishes almost as quickly as the smoke from the field pieces.

The ceremonial outside the House is repeated when the Governor-General leaves, and the final crashing of the guns of the Canadian Field Artillery denotes that the whirl of Ottawa gaiety is about to commence.



The Parliament Buildings at Ottawa, a picturesque group in the Gothic style of architecture. This picture represents the main or administration building, the tower of which can be seen for miles.

Mr. Ford's Page

THE dollar sign is one of the most deceptive symbols in our usage. It deceives because it gives us to understand that the dollar exists wherever the sign exists. A plant is valued at, say, $1,000,000, and no sooner do the figures appear than inexperienced minds conceive the notion that somewhere about that plant one million actual dollars may be found. A physical examination of the plant, however, would disclose only machinery and an organization of human skill for the supply of some community need.

Take four furnaces, fifty stamping machines, a conveyor system, a dozen annealing ovens, a pile of coal, elevators, trucks, buildings, iron and wood and sand—the actual physical inventory of a place—and you never see it expressed in these terms. It is always in $$$$$. Now there are no $$ there, as dollars. There are furnaces, machinery, ovens, trucks, elevators, materials and buildings. These things are valuable. They are intrinsically more valuable than dollars. That is, if you shoveled a building full of dollars, you would not have the same capacity for production and use as you would have if you filled the same building with machinery and an organization of human skill.

On a tax sheet, however, all this mechanical capacity is put down as "dollars," and on that basis a certain number of "dollars" are demanded of it.

The instance has been known in this country where the delusion that equipment is "dollars" has destroyed business through the tax demand.

It is becoming a question how far this translation of things into dollars, and making these the basis of taxation, can continue. When the fact becomes recognized that the dollars are not there, but that articles of use are there instead, public reaction to the true principles of taxation will be more intelligent. At present, a figure of $1,000,000 on the property roll looks like one million actual dollars, and as most people are not in possession of that amount, they readily agree that those who seem to be in possession of it should be made to give up as much as possible. If they have as much money as that, it will not be missed! Such is the common reasoning.

The same reasoning seems to be at the basis of what is called the inheritance tax. The inheritance is always expressed in dollars, yet the dollars are almost invariably never there. But here the old delusion reigns that the values inherited are so many dollars and that for the heir to part with a percentage of those dollars to the public funds is only right.

Such an idea, of course, is misrepresentative of the fact of most inheritances. What most heirs inherit these days is a job, a business to be maintained, a responsibility to be shouldered. To inherit the managing control of a factory or other business is to be saddled with a task upon the wise performance of which depends the employment of men and the livelihood of families. Unfortunately such an inheritance is designated as $$$$, when often it does not contain any dollars, but obligations and hard labor.

It is all part of the fallacy which has steered our country wrong on so many matters pertaining to industry—the fallacy that Business is all Money, and that Big Business means Big Money.

One way to get a correct angle on these matters is to penetrate behind the dollar sign to the thing itself. That will throw a lot of tax injustice into relief. When a business is on the point of expanding, suppose the income tax man should come along and say, "Give me your new machinery fund"—is the money which the government would get under such conditions of half as much use to the country as the factory expansion would have been, with its increase of employment and of national industrial resource? As a matter of fact, is it really dollars that are collected in such circumstances, or is it commodities that are confiscated?

Think of the inheritance tax as collectable in actual possessions rather than in money. Suppose the collector to come along and say, "We must take one of the furnaces, four of the ovens, two of the elevators, ten of the machines, 25 per cent of your coal pile, as an inheritance tax." That would be comprehensible on the theory that some wrong perpetrated against society was represented by the amount seized. It would be comprehensible on the theory that it is wrong to seize a living man's possessions, but right to take them from his children when he is dead. It would be comprehensible on the theory that government deliberately permits criminal increase of machinery and jobs while an industrial manager lives, but quickly abolishes machinery and jobs when the manager is no more.

And yet, such action would be far more just than the present one of leaving the heir with all the physical burden and industrial responsibility while crippling him in the financial department of the business. To cripple a concern financially is like seizing the coal from its bunkers. To collect the things which compose the concern and which the concern possesses, instead of the dollars of which the concern is not composed and which it does not possess, would be the logical thing to do if the so-called inheritance tax is founded on right principle; but the moment you suggest such a procedure you show the fallacy underlying the tax itself.

TAXES may be defined as a demand which everybody favors on the theory that somebody else is going to pay it. Government has done less to educate the people in the principle of taxes than in any other political subject. It is even worse than that, political emphasis has generally encouraged the delusion that taxes are always paid by someone else. The tariff tax, we are told, is paid by the importer; we know it is paid by the consumer. The property tax, we are told, is paid by the landlord; we know it is paid by the tenant. The commodity tax, it is asserted, is paid by the maker; it is paid by the user. It cannot be otherwise, since there is no source of wealth but the public as a whole, and it is the public as a whole that pays all the tax—even the big income tax.

The worst element of our whole tax situation is that it is never put squarely up to the people, either the proposal to tax, or the tax itself. People are for large income taxes and large inheritance taxes because they think that other people will have to pay them. For centuries governments have successfully concealed from the people the simple fact that the people themselves pay every tax that is levied. The foreign importer, we are told, pays the tariff tax. No, he adds it to his bill; we, the people, pay it. It is the same with every tax that is laid, and it cannot be otherwise, for the public energy is the source of all wealth. If there is a great business, public patronage built it. If taxation cripples that business, public patronage must rebuild it. If taxation prevents expansion, public prosperity suffers. Yet people are constantly being urged to favor this or that form of taxation—urged by politicians who would find means to spend ten times the national income if they could get it—and the reason assigned is that "other people" will have to pay it. The truth is that every person pays his share of every tax and it is industry that creates the wealth which pays all the taxes.

It is rather significant that the only forms of taxation submitted directly to the people are those forms which can be made to appear as payable by someone else. The appeal of class consciousness is largely utilized in such matters. It is right, of course, that the tax burden should be distributed according to the ability to bear it, but it is wrong that the tax function should be used as a propaganda for class feeling, class propaganda. There are no class divisions in the actual workings of any tax—*the people all pay it.* When the man of large means makes honest returns and pays large taxes, it is the public that has supplied the money. When the dishonest man evades the tax, it is still the public that pays the difference.

Only one or two facts about taxes seem to have gripped the public mind: one is that the power to tax is delegated to governments by their people; another is that the power to tax is the power to destroy. Basic as these facts are, their principles are not analyzed and applied. People feel the pinch and complain, but they do not seek to understand causes; they do not scrutinize the whole system critically; they think that what always has been, always will be, unreformed and unimproved. But the tax situation is not so hopeless as that. It will show signs of immediate improvement when the public attention is fully turned upon it.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

Let Wages Alone!

PRESIDENT COOLIDGE has let it be clearly understood that he does not favor the reduction of wages as a solution of the railway problem. He thus takes solid ground in the first big problem he has tackled since the election. It is always a confession of managerial inefficiency when the only way out of a difficulty is found in depleting the workingman's pay envelope. Why make the men stand the difference; what are the brains of managers for? Is it not yet sufficiently demonstrated in this country that the best service and the best wages and the lowest rates to the public spell larger business and profits? It is much more in order to propose a reduction in railroad rates, since rates have found means to become pretty high, while wages have gone up by slow degrees and only in response to pressing necessity. And they are not much above the line of American necessity even now.

It will be well for the government to resist every attempt to enlist its support in a movement for decreased wages anywhere. There is no more certain way to curtail the prosperity of the country than by reducing the people's ability to buy. The main foundation of our prosperity is the habit we have formed of expecting the American workingman to be able to purchase and use the commodities which he is employed in making. Any tendency toward changing that order is simply an attempt to force our people down to the level of the German workman.

Italy's Ambition

IN A Farnese villa on the Palatine Hill in Rome there lives a frail, little old man. This is Commendatore Senatore Boni, to whom, it is said, archeology is more than a science—it is a religion. The word archeology is dry-as-dust to most people, but in its best sense it means a delving into the past to rediscover ideas which can be made use of in the present. It is in this spirit that the little old man on the Palatine Hill is working.

Everyday appreciation for their rich national treasures in painting, sculpture and architecture is part of the national life of the Italians. It has checked the modern vandalism which for a time prevailed in Rome, and the disfigurements of the imperial monuments and Renaissance palaces which were perpetrated in the name of "progress" are no longer to be permitted. On the ruins of the Circus Maximus was built the gas-works, and structural outrages of a similar nature were allowed to pass unchallenged.

One may be practical and progressive without being destructive and vandalistic, and Senatore Boni, it seems, is a very practical man; and his desire to rescue ancient treasures from oblivion and to beautify their surroundings is the work of his life. His great chance has now come, for the government is anxious to commemorate in some endurable manner the advent of Fascism, and Mussolini suggested a great theater. "Why not remove the gas-works to another site and restore the Circus Maximus?" says Boni.

Now there is a possibility that the scheme may be carried out. The Circus Maximus was the largest auditorium of the then known world; epic contests like the chariot race in "Ben Hur" took place within its precincts. It was a symbol of the ancient empire's most vigorous period. It is to a reinvigorated Italy that Mussolini would like to see this splendid monument restored, and it is to Senatore Boni he turns for direction in the work.

There is something significant in this desire of Italy to throw off the sordid slough of misdirected effort and to dig to the roots of things in an endeavor to rebuild her ancient greatness. There is no doubt that Italy's most valuable asset in the past was her mastery of the fine arts, and a second Renaissance is now her greatest ambition.

The Training of Parents

TODAY we hear a good deal about the training of children; but what about the training of parents? It is too much the custom at the present day to place the blame for the young man or young woman who has gone wrong on the schools, the colleges, or the churches; but none of these institutions is originally charged with the upbringing of children. It is in the home that the child is raised, and it is in the home that it ought to be cared for. All other factors in the shaping of the character of the boy or girl, good or bad, are more or less external.

Why then should not more attention be devoted to the training of parents?

It has been asserted by one of the leaders in social welfare work in Chicago that there are in that city about 200,000 youths who are entirely beyond their parents' control. Almost every large city tells a similar story. One of the commonest things we hear today is that our young people are hurrying headlong to Hades. A leading criminologist of New York says that it is because the parents are showing them the way. He says that it is lack of religion, and that any religion is better than no religion at all. By religion is meant a system of ethics that have a divine sanction and that have directive and corrective influences.

When the home becomes a sleeping place and nothing more family life has decayed; when parents and children dine out (but not together), and the evenings are spent at entertainments where each member of the family goes his or her own way, it may be considered independence, and freedom, and various other things that are supposed to be characteristic of a free and enlightened age; but it is simply a wholesale smashing up of elements inestimably precious in our civilization.

It Was Not a Fake

AFTER "foreign correspondents" of United States newspapers had diligently carried Bolshevik propaganda by assuming that the Zinovieff letter which determined the British election was a "forgery," and by cabling to this country as many "explanations" of the letter as there are "explanations" of the so-called Protocols of the Wise Men of Zion, the British Government has declared the letter authentic, and upon that fact has overthrown the treaty made with Russia by the Ramsay MacDonald government.

It was never doubted that wise old Britain was more than a match for the utterly faithless and non-Russian rulers of modern Russia. Even Ramsay MacDonald, toward the end of his term, saw that there could be no plighted faith of any sort between a civilization bent on spreading its light, and a communist barbarism bent on destroying that light.

Concern for Britain need not trouble us, but there is a nearer question: how is it that the American press first gets the Bolshevik interpretation of these matters? How is it that our first news is replete, not with the knowledge of correspondents, but with inspired statements approved at Moscow? The New York *World* is one of the worst offenders in this respect and, of course, the papers that reproduce the *World's* dispatches from London have little choice but to pass it on.

The Bolsheviks have once more overplayed their hand. They have shown themselves incapable of understanding the normal mind of the rest of the world. By this sin Germany fell. There is a fine candor in Foreign Secretary Chamberlain's announcement to the Bolsheviks that the Zinovieff letter, and unquestioned official utterances in Russia, and the Bolshevik program actually in progress in Great Britain, form a perfect parallel. What Bolshevism desires against Christendom is finally clear.

The foreign secretary's letter ends with a curt refusal to discuss the matter further. But this is not the only thunderbolt that the new government has launched at the heads of the Soviet and its alter ego, the Third International, with its headquarters in Moscow; it has repudiated in brief but cutting terms the treaty made with Russia by the Ramsay MacDonald government.

Stanley Baldwin and his colleagues refuse to be fooled. They are fully awake to the activities of the international alien who, under a name to which he has no right, seeks to upset constitutional government not only in the British Isles but in every other part of the earth where he imagines his poison gas is likely to take effect.

Union vs. Union

THE country has been afforded the curious spectacle of the American Federation of Labor calling upon the Brotherhood of Locomotive Engineers to unionize their coal mines or incur the penalty of being declared "unfair"—whatever that may mean. There is no charge that the Brotherhood is not paying a proper scale of wages or providing proper working conditions; the charge is based on the Brotherhood's refusal to permit the unionizing of its mines.

Here we have the unusual circumstance of a great labor union going into business, but refusing to promote unionism in the business it controls. There must be some reason for this, and it is not difficult to trace. The Brotherhood knows that the coal troubles of the country have arisen from the obstructive leadership of the miners' unions. It knows also that the best mines in the country, regarded from the miners' and consumers' standpoint, are the non-union mines. It probably knows also that the strike has been used for purposes quite other than those announced to the strikers and the public.

There are so many more mines open in this country than the needs of the country require, and the whole industry has fallen into such a disorganized and unbusinesslike condition, that to save itself from destruction Mine Unionism has been using the strike to put mining district after mining district out of business, to consolidate union control in other districts. Most coal strikes are thus to be viewed in the light of battles deliberately provoked for the purpose of starving out the striking miners, closing down the mines, and all of this by design of union leadership. The only coal strikes the country ever hears of are in union mines, and the chief losers are the strikers. The great mining battles of a few years ago, when armies of gunmen were marshaled forcibly to unionize non-union fields, have been abandoned after the expenditure of millions of dollars of union funds—collected from workingmen—in fruitless attempts to establish unionism on a basis of terrorism.

The Brotherhood of Locomotive Engineers, in its capacity as mine-owner and employer, knows better than to jeopardize the safety and productiveness of engineers' funds by introducing into their coal territory the old stupidities of union miner leadership.

It will be a national service when the Brotherhood makes it clear to the public on just what principles it is acting in this matter. Needless to say, the threat of the A.F.L. may be expected to have no effect whatever.

Kings and Dictators

IBANEZ, the Spanish novelist whose fame with American readers is now widespread, reveals himself again in the guise of a political protestant against the policies of his King Alfonso. Extraordinary efforts have been made in recent years to give the world an acquaintance with Alfonso, and those who have met him report him to be a modern-minded man. But, after all, a king is judged by the progress of his country, and it seems to be at this point that the rage of Ibanez arises.

King Alfonso carried off the incident of the dictatorship very well. One wonders how a king feels when a dictator rises beside him and seizes the helm of state. There are a lot of little dictators along the southern edges of Europe these days, and their presence is a confession of a preceding incompetency. The kings may not feel so badly about the dictators as they might, because it was not from kings that the dictators seized the power, but from corrupt parliaments and ruling groups. But the presence of such parliaments and groups indicate that the kings were not on the job of ruling. Kings were not courageously interposing themselves between the people and the grafters. They were not insisting on their divine right to serve the general population, the burden-bearers of the nation.

What a fine opportunity there was in Italy and in Spain for a king to arise and rule, as in America we should have expected him to do. Kingcraft is not so much out-of-date, but kings do not seem to possess the gift as once they did. A king who should throw his weight against corruption, stand for equality of opportunity, give his active co-operation to industry and the enlargement of the people's life—such a king would be invincible. For no one rules so inevitably as he who rules by service. It was the ability to lead and to serve that gave kingship its start; the king was the man who knew most, led farthest, and served most wisely. The people elected him on these his merits.

The appearance of dictators proves that the elements of kingship are not dead, but they have somehow been left out in the making of most kings.

An American City Which Declared a Dividend

Knoxville Reorganized Its Finances and Gave Taxpayers Surprise of Their Lives

By HARRY HART

Airplane view of a portion of the retail and financial district of Knoxville. Many new buildings are being erected each month throughout this and other sections of the city.

IN THESE days, when so many municipalities are floundering in the bog of a constantly growing indebtedness, and the taxpayers resignedly look forward only to bigger deficits every year, which must be made good by them, it is refreshing to find one American municipality—possibly there may be others—which has succeeded in placing its financial affairs upon such a sound and efficient basis that the deficit has been converted into a surplus, and a dividend actually declared, payable to the stockholders—the taxpayers of the city.

The example of Knoxville, Tennessee, is timely and significant as showing that a city's finances can be handled just as intelligently, simply, and efficiently as those of any well-conducted business. While Knoxville has a city manager, the experience of this municipality in the reorganization of its financial department may be studied with profit by cities operating under different forms of government, for the simple reason that two and two make four under any type of municipal political organization.

Knoxville, although founded as far back as 1792, is one of the most progressive and modern cities of the Central South. It is the county seat of Knox County, situated 110 miles northeast of Chattanooga and 160 miles east of Nashville, at the head of steam navigation on the Tennessee River, and connected with South Knoxville by a fine steel bridge. It is located on the main lines of the Southern and Louisville & Nashville railway systems, eleven lines radiating from the city, with seventy-two passenger trains entering and leaving daily.

Knoxville is an important center of the lumber industry, its annual business under this head amounting to $2,500 000. The annual exports of marble total some $5,000,000; practically all of the famous Tennessee marble originating in the Knoxville district. Knoxville likewise is adjacent to the great Tennessee-Kentucky coal area, and does a coal business of some $20,000,000 each year. Zinc and copper mining also are conducted on an extensive scale in the Knoxville district, the annual export mounting to many millions of dollars' worth of these metals.

The city manager, Louis Brownlow, in explaining to the writer the circumstances attending the recent reorganization of the municipal finances, said:

"When the city manager charter came into effect at the beginning of Knoxville's fiscal year, October 1, 1923, the council was faced with the immediate task of preparing a budget. It had only the experience of former administrations to guide it. Taking the expenditures of the previous fiscal year as a basis, the council made up a budget which involved $500,000 reduction in expenditures. Then they estimated the revenues and levied a tax rate of $2.44 to balance the budget."

It appears that the city had a deficit from the preceding year amounting to $1,000,000. The tax rate for that year was $1.90, whereas based on existing assessments it should have been $2.93, to meet the expenditures actually made.

When the city manager took office last December there was installed an improved accounting system. By the middle of June the new system was producing daily reports which clearly indicated that there would be a surplus in revenues. On July 26, this surplus, after setting up adequate reserves for errors in assessments, slow collections, and the like, amounted to more than $300,000.

It was thereupon recommended to the council that a 10 per cent refund in taxes be ordered. It would have been easy, of course, to have retained all the surplus, but, as Mr. Brownlow explained to the writer, this probably would have encouraged extravagant expenditures and it was therefore decided that it would be better to make the refund direct to the taxpayers.

The report to the city council, setting forth in simple, non-technical language, the details of the reorganization of finances which made it possible to build up this large surplus, was as follows:

"To the Council of the City of Knoxville.

"Gentlemen:

"I have the honor to recommend that the Council pass an emergency ordinance providing for the refund of 10 per cent of the taxes already paid and yet to be paid on account of the tax levy for the fiscal year 1924.

"This refund will amount to 24.4 cents, and while the tax levy for the current year necessarily will remain at $2.44 per hundred of assessed valuation, the actual tax paid will be reduced from $2.44 to $2.196.

"When this Council assumed office the first of October, 1923, it was faced with the immediate task of preparing a budget under the strict budgetary provisions of the new Charter, and, according to law, the task had to be undertaken and accomplished immediately. Mr. Howell J. Davis, temporary City Manager, Councilman Keller and other members of the Council worked together on the preparation of the budget, and I, who at that time had not come to Knoxville, came here for two days' consultation in that connection.

"Without previous experience in the conduct of the City administration, it was impossible for the Council at that time to base their estimates upon anything except the experience of the previous administration as it was exhibited in the books and auditor's reports then available.

"It was determined from the first that the expenditures would be considerably reduced from the amount of the expenditure of the previous fiscal year, and this was done when the budget was adopted, providing for a gross expenditure of $3,826,823. Against the total of the appropriations made for the budget was placed an estimate of the revenues to be received, of exactly the same amount. The new Charter had abolished the City Tax Assessor and had provided for the use of the assessment figures of the county assessing authorities.

FUNDS	Balances Last Report	Receipts Today	Vouchers Issued Today	Balances Today
General Fund (Cash for general departmental purposes from which all budget expenses are paid.)	$687,966.53	$ 5,790.02	$ 4,125.00	$689,630.15
Permanent Improvements Fund—Oakwood Sewer (Cash to pay for constructing Oakwood Lateral sewer unit from sale of permanent improvement notes.)	$ 78,000.00			$ 78,000.00
Street Assessments Fund (Money collected from abutting property owners to pay their share of street improvemeot bonds.)	$ 4,404.53	$ 41.25		$ 4,445.78
Street Improvement Fund (Money obtained from sale of City's share of street improvement bonds to pay for paving.)	$ 54,367.55			$ 54,367.55
Floating Indebtedness Fund (Money obtained from sale of bonds to pay accumulated indebtedness of previous years. Most of this will be paid out by October 1st as notes become due.)	$929,062.07		$ 12,679.35	$916,382.72
Tennessee School for Deaf Fund (Money held to pay notes due to state on purchase price of Deaf and Dumb School Property as notes become due.)	$250,000.00			$250,000.00
TOTALS (All cash in banks and treasurer's office.)	$1,963,796.80	$ 5,831.27	$ 16,804.78	$1,972,826.80
Sinking Fund, Cash and Investments (Amount in cash and bonds held by Sinking Fund Board to pay at maturity general and corporate bonds of the city.)	$478,999.83			$478,999.83

"The figure used in the estimate upon which to base the tax rate was, in round numbers, $101,000,000, as against a total assessment of the previous year of $96,660,000. The actual assessment as ascertained for this year, still to be decreased by the elimination of some double assessments and errors, and still to be increased by further assessment of ad valorem taxes, now stands at $111,000,000 in round figures, or $10,000,000 more than the figures used in the estimate of revenues upon which the budget was based.

"On the other hand, although the appropriations made were reduced far below the actual expenditures of the previous year, it now becomes clear that it will not be necessary to expend all the money appropriated to the budget, although the appropriation for some purposes, such as streets, necessarily will be used up.

"The fact that the revenues were accruing in an amount sufficient to produce a surplus over and above the actual requirements of the year, was made manifest as soon as the new accounting system began, on June 18, to produce daily reports of the fiscal affairs of the city. These reports have been carefully analyzed, and the supporting figures checked through the books of the City.

"This report shows that on July 26 the revenues ascertained amounted to $4,166,937.84, or $303,114.84 in excess of the total budget requirements for the year. By revenues accrued, I do not mean, of course, actual cash collections, but I mean the revenues actually charged on the books in the form of taxes assessed, water bills, hospital bills, and so on. This amount also includes all assets inherited from the previous administration.

In other words, the books show, at the close of business on July 26, realizable revenue assets of $300,000 in excess of the total requirements of the current fiscal year.

"This figure does not represent the whole of the revenue surplus for the year. It will be added to by all of the revenue accruing for the remainder of the fiscal year, which will include further assessment of ad valorem taxes, water bills, hospital bills, inspection fees, court fines and other miscellaneous revenues of the City.

"Although I do not think it wise or prudent to base any action upon an estimate of these accruals, for purposes of information I desire to state that they probably will be in excess of $110,000. It also will not be necessary to expend all of the moneys originally appropriated in the budget, and to the extent that the budget appropriations are not spent, the revenue surplus will be increased.

"Whatever may be the eventual amount of the surplus, it would be improvident to base any action upon estimates further than to recognize the fact that the surplus inevitably will be increased above the $300,000 now shown as the balance of income accrued in excess of total requirements for the year.

"I believe that the prudent and economical administration of municipal affairs requires that the City should take from the citizens in the form of taxes no more than is necessary to conduct the business of the City for the tax period. *Not to overtax the people is as*

Eating the Correct Food Cheats the Doctor

Faulty Nutrition Declared the Principal Cause of Most of the Human Ills

By MARY E. BAYLEY

TO MOST of us nutrition means the question of something to eat. Our habits have been based on custom and not knowledge. And if we feel full and comfortable, we think we are well nourished.

There has been during the past few years a confusing array of advice and direction, appearing in books, magazines and newspapers, in an attempt to educate the housewife in matters relating to nutrition. Much of this has served only to confuse the public mind. It has not only tended away from simplicity, *but it has not embodied the new principles which scientific* research has firmly established. It has been based largely on the old view, universally accepted a few years ago. That satisfactory nutrition could not be secured without the solution each day of a scientific problem. That the housewife must be confronted with tables giving the fuel values and content of protein, fat and carbohydrates in foods; that she must visualize a hundred calorie portion of all the common foodstuffs. Also that she must keep rigidly in mind the special needs of different members of the family group. An attempt to follow this plan has resulted usually in the housewife providing such things as from experience she knew her family liked, giving them as much as they wanted, and in this way disposing of the subject of nutrition.

The White Flour Cult

WE CANNOT measure the value of all foods in terms of energy value. For many other things have to be considered. The caloric value (energy value) of food is, therefore, no longer considered the correct test to a nutritious diet. We now know that biological chemistry, which studies the effect of certain foods on life, is the correct test. Through this science there has been produced overwhelming evidence that "the keynote to successful nutrition is the selection of foods having unlike dietary properties, but so constituted as to supplement each other's deficiencies and to make a mixture which affords the most satisfactory amounts of each of the essential food elements rightly combined."

And what does this mean? Simply that it is necessary to keep in mind that most of our common foodstuffs are in one or more respects deficient in some degree. But in different classes of foods these shortcomings are not the same. Thus by using suitable combinations, which in the correct manner supplement each other's deficiencies, proper nutrition is secured. In other words, the proper balancing of the diet is the key to successful nutrition.

In recent decades Americans and some of the peoples of Europe have adopted a type of diet never before tried by man, at least not on an extensive scale. This diet consists primarily of bread made from refined white flour, cereals, potatoes, meats of the muscle type, and a large percentage of refined sugar, other things being secondary and of irregular additions.

While in this country we do not suffer from the terrible diseases that are caused by marked deficiencies in diet, we do know that pellagra, a distressing disease now afflicting no fewer than one hundred and seventy thousand persons in certain parts of the South, has as its predisposing cause faulty diet. We do know that rickets—a common disease of childhood—while not a deficiency disease in the same manner as those mentioned, is the result of faulty nutrition. And also we know that the round shoulders, flat chests, and poor teeth, seen so frequently in school children, are in large measure the result of faulty diet.

While the diet and mode of living of large numbers of persons is not sufficiently faulty to cause the health to fail completely, it may yet be of a character to bring the individual into a state of constitutional inferiority, or chronic nutritional instability. While the outward signs may be long in appearing, they will in later life be reflected in lowered vitality, early aging and low resistance to infection.

That diseases due to wrong dietary habits have increased is no longer a matter of guesswork. It is an established fact. While living conditions have through sanitation been improved, epidemics brought more or less under control, the infant mortality rate cut in half, and through preventive medicine, immunity produced against many diseases—the death rate from diseases affecting the heart, blood vessels and kidneys have increased. In fact the records show an increase of nearly 100 per cent in thirty years.

Diet Which Lacks Nutrition

THERE has also been an increase in nervous and digestive disorders. These diseases are increasing in people of all ages. While hardening of the arteries, kidney and heart degeneration are supposed to be old-age diseases, they now reach down into middle life. And among the four hundred and ten thousand persons who die annually from them, sixty thousand die under the age of forty years, one hundred and five thousand between the ages of forty and sixty and two hundred and forty-five thousand above the age of sixty.

That we can grow old because of food deficiency (lack of proper kinds of foods in proper amounts) on the one hand, or food excesses on the other, is now a well-recognized fact.

As a branch of preventive medicine, the study of the science of nutrition has assumed greater importance than ever; for in recent years new and surprising relations between food and health have become apparent.

It is only within the last few years that anyone could say what constituted a proper diet. It is, however, now known definitely that the regular diet of a large portion of the people in the United States and in some parts of Europe is falling short of maintaining proper nutrition. This knowledge has been gained wholly by experiments on animals and applying the results to human beings.

And now that it may be appreciated why certain combinations of food make good each other's deficiencies, let us examine some of the new facts which modern nutritional studies have brought to light.

First. There has been revealed the unsuspected fact that the leaf of the plant (leafy vegetables) has dietary properties which chemical analysis does not reveal. And this means: That green vegetables have taken a unique place in the diet. It has been found that the root vegetables (potato, carrot, turnip, beet and radish) have certain shortcomings in common and when foods of this class are used together, they do not greatly enhance each other's value.

Second. There is a remarkable difference between the dietary properties of leaves (leafy vegetables) or of milk, as contrasted with any of the ordinary seeds (peas and beans), tubers (potatoes), root vegetables (as sweet potato, carrot, turnip, beet, radish) and meats derived from muscle tissue of animals (ham, steak, roasts, and so forth). And what is this remarkable difference?

Simply that of all our common foodstuffs, milk and the leafy vegetables are the only two classes which are relatively rich in calcium, the principal element in lime. And this means that of all our foods these—milk and the leafy vegetables—are the only two classes that do not fall below the nutritive requirements of man in their supply of calcium.

A pound of the leaves of various plants contains from five to twenty-five times as much calcium as does a pound of whole wheat. The corn kernel contains less calcium than wheat, and rice contains much less than corn. Potatoes and fleshy roots are also poor in calcium; peas and beans, however, contain more than the cereal grains.

Shortage of Mineral Elements

WHILE it has long been known that there were several mineral elements which must be furnished by our food, it was not until recently that the significance of other facts was appreciated, namely, that most of our common foodstuffs did not contain enough of these mineral elements to meet the needs of the body, and that the body is surprisingly sensitive to a shortage of any one of the indispensable mineral elements.

As an example of the necessity of supplying to the body the maximum of its mineral needs it may be mentioned that:

> "Potassium is a constituent of all tissues of the body, but the relative amounts in different structures vary considerably. Only when there is a certain relation between the potassium, sodium and calcium concentration in the blood will the heart beat normally. Other functions of the mineral element could be mentioned, in the performance of which each plays a specific rôle and in the performance of which one element cannot be replaced by another without causing disturbances of metabolism or even death."

The root vegetables (sweet potato, carrot, turnip, beet, radish), potatoes, peas and beans, and lean meats (steak, ham, roast, and so on) are all poor in calcium. And the milling products of wheat, corn and rice are also poor in phosphorus and iron. And what is the significance of this?

Simply that these foods must be used in combination with calcium rich foods, such as milk or leafy vegetables, and the addition of meat or eggs cannot take their place. These two classes of foods (milk and leafy vegetables), since they tend strongly to correct the deficiencies in a cereal, potato, peas, beans and root vegetable diet, or one in which in addition to these, muscle meats are included, have been termed "The Protective Foods."

Eggs and the glandular organs of animals, such as liver, kidney, and so on, serve partially to correct the deficiencies of this type of diet, but they cannot take the place of milk or the leafy vegetables, because they are too poor in calcium.

The Great Importance of Milk

MODERN studies in nutrition have emphasized the great importance of milk. That milk is a complete food for the young and necessary in the diet of the growing child is a fact already too well known to need comment. It is, however, not so well known that milk is particularly valuable for the adult. It not only corrects in a remarkable way the deficiencies of those foods which form a large part of our diet, but, in its natural state (unheated) milk contains all three of the vitamines, fat soluble "A," water soluble "B" and water soluble "C." Its fat is the best source of vitamine "A" (fat soluble "A"). This substance is not found in any vegetable fats or oils and, with the exception of butter fat, is *abundant* among our common foodstuffs, only in the yolk of egg.

The leafy vegetables and the glandular organs (kidney, liver, and so on) are, however, a source of fat soluble "A." It is found also in lesser amounts in the root vegetables and legumes. Any diet containing whole milk, raw fruits and vegetables, especially the leafy vegetables and salads, will be rich in all the vitamines.

Fruits and those vegetables which can be eaten raw have a special and very important rôle in nutrition as carriers of anti-scorbutic substances. Fruits and vegetables also have great value as correctives of faulty elimination, whether taken raw or cooked. And in addition to these properties, fruits and vegetables when added to the diet "tend to the establishment of a proper acid base equilibrium in the various fluids of the body." The ash of fruits and vegetables is alkaline. Most seeds give an acid ash and meats are also of acid character.

"The meat and bread portion of our diet when oxidized in metabolism leads to the formation of an excess of acid over base-forming substances. It is now a well-established fact that a certain alkali reserve in the blood is essential to maintain its capacity to carry carbon dioxide to the lungs for elimination, and that a common pathological condition, acidosis, exists in which this reserve falls below normal."

It has also been discovered that there is a great difference in the nutritive value of proteins from different sources. The proteins of the cereals, of beans and peas, potatoes and other root vegetables, are of rather poor quality.

The second and concluding installment of this article will appear in a succeeding issue.

A Strange Little Songster By D. LANGE

THERE must be something impressive about a bird song which one can remember eighteen years, for such has been my experience with the song of the winter wren. I heard the song first in June, 1906, in an alder thicket on a wild stream some fifteen miles north of Lake Superior; and I did not hear it again and had no opportunity to study and enjoy it, until the summer of 1924 near Lake Anjigami and the Michipicoton River in Ontario.

The song is a well-modulated and well-sustained whistle; high-pitched, but not shrill. It comes unmistakably from a small bird, but it has none of the wiry, chirpy qualities and none of the lisping faintness characteristic of the warblers, which inhabit the same kind of wild forest. If the chattering notes of the house wren could be made really musical and more sustained, they would come near representing the song of the winter wren.

The wrens are all active and voluble songsters, but the only one who has a voice and real musical ability is the winter wren. It must, however, not be inferred that the pert little bird sings in winter. The unfortunate name was fixed on the bird nearly a century ago by Alexander Wilson, who became acquainted with it in its winter range near Philadelphia. I should like to call it the alder wren.

All the wrens, house wren, marsh wren and winter wren, remind me of lively children. Whenever one sees them they are going or coming or doing something. Other birds, including the active warblers, will at times perch quietly for five or ten minutes or longer. I have even seen a humming bird sit quietly on a dead twig for twenty minutes. But who has ever seen a wren sit still for five minutes?

It is well known that house wrens and even to a greater extent the marsh wrens build more nests than they ever use for raising their broods of young, and I discovered last summer in the wilds of Ontario, that the winter wren also builds at least one nest, which is not intended for eggs and young. The use of these nests has been a mystery.

By a fortunate accident I found two nests of the winter wren, both within about twenty miles of the northeastern bay of Lake Superior. The first one was tucked away under the log roof of a deserted lumber camp at the junction line of wall and roof. A small natural cavity was neatly closed with a partition of delicate green moss, leaving a round hole just big enough to admit the small bird. I found the nest on June 23. Two weeks later it contained no eggs and I did not see the wren near it. My first conclusion was that the nest had been abandoned.

But about July 1, I discovered another nest very close to my camp. In this case I saw the wren carry the same kind of green moss, and I both saw and heard him sing within a few feet of me. Knowing that the bird must have a nest close by, I watched him whenever I had an opportunity, and a few days later I saw him dart out from under the roots of a fallen tree on the trail to my spring. I knelt down and examined the roots carefully and discovered a neatly built nest with a front of short sticks and green moss, a neat round entrance hole, and a lining of fine moss; but this nest also was empty.

However, I expected it would soon contain eggs, because both my companion and I saw the bird come out of it several times, and he was singing daily within a few rods of the nest.

But the nest remained empty. About August 5, I met the family, about six in number, getting ready to start south, and then I began to wonder if I had not, after all, made a discovery, even if I had failed to find the nest in which the young were raised.

I believe the nest I found was built by the male to be used by him as a sort of bachelor's hall for an occasional rest and retreat. And I wonder if the winter wrens, and also the house and the marsh wrens when they get tired and sleepy do not resemble active children in this respect that they love to retire to a nice cozy corner? No place would be better adapted for this purpose than a cozy camp nest in a cool shady place, affording protection from the glaring sunlight as well as from wind and rain. And I wondered if Billy Wren kept the location of this rest camp secret from his rather querulous and temperamental mate.

America's Leading Keeper of Wild Animals

W. H. Blackburn Relates His Experiences With the Denizens of the Jungle

By C. R. ASCHEMEIER

THE National Zoological Park at Washington, D. C., is one of the show places of our nation. It was established by an act of Congress in April, 1890, and was placed under the direction of the Smithsonian Institution.

There are 170 acres, situated in beautiful Rock Creek Valley. Ned Hollister the superintendent, and an eminent mammalogist, died recently.

The interest of the public in the National Zoological Park is attested by the number of visitors. The average annual attendance is about two and a half million persons.

There are many other zoos in the country, and many other keepers of animals, but the national zoo is very fortunate in having a man of W. H. Blackburn's ability to supervise the care of its animals. But the animals destined to Mr. Blackburn's care are to be considered extremely lucky; for without doubt he thoroughly understands the wants and needs of any creature, sick or well. In truth, he is a man who loves animals.

It is customary for Mr. Blackburn to make one or more trips over the entire park each day regardless of the weather. Although the keepers under him are quite efficient, they are allotted only certain animals to take care of. There are at present about two thousand animals.

Mr. Blackburn was for many years an animal trainer for Barnum and Bailey. His specialty was the large "cats" (lions, tigers, leopards and pumas) and bears.

The most exciting incident of his career as a trainer happened in New York State. It was while giving a street parade for the benefit of two small towns, three miles apart.

Mr. Blackburn, attired in kilts, the dress of the Scottish Highlander, was in a cage with several lions, seated on a stool. There was one in particular that was exceedingly dangerous, and which refused to be struck with a whip. (A keeper before Mr. Blackburn tried it only once, and barely escaped with his life.)

Things were going along quite serenely. The parade had passed through one of the towns and was on its way to the other, when a terrific electrical storm broke forth. The cages consisted of two compartments, and Mr. Blackburn had succeeded in getting all but the bad fellow into the inner inclosure.

A run was made for the other town, and as the horses galloped briskly onward, the head keeper had the most exciting time of his long career. The lion came straight at him, and his stay on earth seemed limited.

The only means of defense Mr. Blackburn had was the stool on which he was seated. The lightning flashed with great frequency, and he dealt the lion several blows on the head with the stool, but without avail. All the while the lion kept his eyes tightly closed. Finally the animal got his head under Mr. Blackburn's kilt and crowded him into a corner, holding him there firmly. By an almost superhuman effort he extricated himself from the corner, but the lion with its head still covered stayed right with him.

Just as the parade reached the other town the storm ceased, and once the lightning and thunder was over the lion acted quite normally. The lion had been thoroughly frightened by the storm, and Mr. Blackburn by the lion.

Mr. Blackburn, when asked about the training of the large "cats," said that the ones who put up a fight were by far the best. Those who would lie in a corner were less intelligent, and bore close watching. There was no telling when they might attack in their stealthy way.

The first animals in the park were two Indian elephants presented by the Adam Forepaugh Shows people. There was no place to put them so they were chained by Mr. Blackburn to trees until autumn, when a suitable house and inclosure was ready for them. It meant carrying water up a hill, and those elephants could drink water, said Mr. Blackburn.

As people pass through the park and see the beautiful scenery little do they realize all that has been accomplished in transforming a wild, desolate place into one of the finest zoological gardens in the country.

In 1913, Mr. Blackburn was commissioned to go to Egypt and bring back a large shipment of animals. Among these were two African elephants, three large baboons and several camels and antelopes. Again he demonstrated his ability to handle animals by landing them in first-class condition.

In the shipment were also included two cheetahs or "hunting leopards." At that time they were the size of ordinary house cats. They have now been in the National Zoological Park eleven years, and are the only pair in the United States today.

There are other animals and birds quartered in the park, many of which are very rare. Among these are the California condors, of which the National Park has had three for more than twenty years. During that time they have laid three eggs.

There is also the ounce or snow leopard. This animal was offered to the park for $800. It was sick and could hardly stand, but Mr. Blackburn nursed it back to health. Today it is one of the stars of the zoo. There is also the Aard wolf, a toothless animal resembling a hyena more than a wolf. The long-eared fox also found in Africa is another rare animal.

Keeping animals alive, whether born at the park or imported from their native haunts, is far from being an easy task. But through the efficiency of Mr. Blackburn, all descriptions of animals have thrived well.

A feat performed by Mr. Blackburn was to keep a sloth, that queer ungainly animal from the Amazon Valley, alive for more than three years.

There are numerous other animals that have lived for years in the National Zoological Park, and in many instances they have multiplied to such an extent that it has been necessary to sell the surplus to other parks.

There is a young rhinoceros at present doing well at the park. It was a puny little thing on its arrival, and was only bought on the strength of Mr. Blackburn's ability to pull it through. It acted morosely and its life was despaired of. Mr. Blackburn at once hit on the idea of giving it a playmate. This happened to be an ordinary goat. An immediate change for the better was noticed in the baby rhinoceros. Prolonging the lives of animals means that less numbers of them have to leave their native haunts to supply parks and circuses.

Top—California condor. Center—W. H. Blackburn. Left—Pig-tailed monkey and young. Right—Young guanaco born at the park. Bottom left—"Ben" the Bengal tiger. Bottom right—A lion presented to Colonel Roosevelt, by the late King Menelik of Abyssinia.

Musk ox doing well at the Zoological Park. They are from Greenland.

A female African elephant brought back from Egypt in 1913 by Mr. Blackburn.

The Fascinating Romance of Fort Dearborn

Towering Skyscrapers Now Mark the Spot Where Indians Roamed Many Years Ago

By J. V. NASH

Fort Dearborn and the Kinzie House, 1831.

Site of old Fort Dearborn and John Kinzie's house, as it looks today.

AS THE visitor to Chicago rides in one of the new motor buses up Michigan boulevard and across the magnificent double-deck bascule bridge which recently replaced the old Rush street drawbridge across the Chicago River, connecting the north and south sides of the city, he finds himself in the midst of two mighty streams of motor traffic passing up and down between towering white skyscrapers and over the shadowy river with its burden of barges, whaleback steamers, and nondescript craft. Over this giant bridge there flows daily a volume of motor traffic said to be the greatest in the world.

Here, at this great focal point of a twentieth-century city of three million population, where all the wonders of a mighty modern metropolis crowd upon the view, it is difficult to realize that a brief century ago there stood an old log blockhouse with palisades, outside whose walls Indians and fur traders loitered and bargained.

The story of old Fort Dearborn is one of the most fascinating in the long history of pioneering in the western wilderness. Around this primitive blockhouse there grew up, in the short space of a single lifetime, the second largest city on the continent and the greatest railroad center in the country.

Although the fort itself, the nucleus of modern Chicago, was not erected until 1803, the site had long been one of historic interest.

The first white men who are known to have visited the spot where Chicago now stands were two Frenchmen, Louis Joliet and Jacques Marquette. Chicago has always been known as the city of youth, and it is significant that the first white visitors to its site were young men, Joliet being in his twenties and Marquette in his thirties at the time.

In 1672 Colbert, minister of Louis XIV, sent instructions to the governor at Quebec to arrange for an expedition to explore "the great river" and ascertain the location of its outlet. In the Jesuit records of French Canada, dating from this time, we find the following reference to this expedition:

> "The Count Frontenac, our governor, and Monsieur Talon, then our intendant, recognizing the importance of this discovery . . . . appointed for this undertaking Sieur Joliet, whom they considered very fit for so great an enterprise; and they were well pleased that Father Marquette should be of the party."

GENERAL HENRY DEARBORN.

The party, consisting of Joliet and Marquette with five other men, started in two canoes from the mission of Saint Ignace, which Father Marquette had established at the Straits of Mackinac. Joliet had already explored Lake Superior, had brought to Quebec some specimens of copper, and when stopping at Saint Ignace had made the acquaintance of Father Marquette. The two had discussed the subject of the mysterious river, about which Joliet had heard much from some wandering Indians who came from the south and who called themselves the Illini. They had even extended an invitation to him to visit their villages, which they said lay "thirty days' march distant."

It was on May 17, 1673, that the party, leaving Saint Ignace, started paddling its way down Lake Michigan and reached the mouth of the Fox River at the head of Green Bay, where stood the mission of St. Francis Xavier. Green Bay itself had been discovered in 1634 by the explorer Jean Nicolet, who first made the passage through the Straits of Mackinac into Lake Michigan, and when he reached Wisconsin was firmly persuaded that he had arrived in China, and to make himself feel at home donned a gorgeous mandarin's robe which he had brought along for the purpose.

The expedition made its way down the Mississippi to the mouth of the Arkansas. Then the explorers found it necessary to turn back. They ascended the Illinois River to the Desplaines, from which, by a very short portage, they reached the Chicago River, and floated out upon Lake Michigan. This was in September, 1673. The party then returned safely to Quebec. On Marquette's map, which is still in existence, we can trace in roughly accurate outline, "Lac Huron," "Lac Superieur" or "Lac de Tracy," and "Lac des Ilinois" (Lake Michigan).

Six years later, in 1679, the Sieur La Salle, at the head of an expedition numbering seventeen, came down through the Straits of Mackinac into Lake Michigan, and skirted round the southern end of the lake, looking for a more favorable river route into the interior. He believed that he had found it when he discovered the St. Joseph River, where the city of St. Joseph, Michigan, now stands. Paddling up this stream, he crossed the portage into the Kankakee, thence to the Illinois River, and at a point near where Peoria now stands he built a fort. The following year he led another expedition over the same route.

Toward the end of 1681, with a much larger party, La Salle traversed the Chicago-Desplaines route which Joliet and Marquette had opened, into the Illinois and thence down the Mississippi clear to its outlet in the Gulf of Mexico, upon whose sparkling salt waters he gazed on April 7, 1682.

While engaged in an attempt to found a colony in what is now Texas, on the shores of the Gulf, La Salle was killed in a quarrel, on March 19, 1687. The same year a party of five survivors of La Salle's ill-fated Texas expedition, after enduring much hardship, reached the site of Chicago and spent some time in the vicinity. Joutel, one of the party, has left an interesting account of the region. He tells how the party eked out its scanty provisions with "a kind of manna," which seemingly refers to maple sirup, and wild onions, which grew in profusion in the surrounding woods, and from which, he adds, the region takes its name, Chicago.

There is such overwhelming evidence of the derivation of Chicago from the Indian name for the wild onion, that one can no longer take seriously such fanciful stories as that it was derived from two Latin words, "circum" and "ago," whence "Circago" and finally "Chicago," signifying "I busy myself about"—in allusion to the strenuous life which the situation of the place necessitated, prophetic of the future city's tireless activity. Cadillac, the French commander at Mackinac, in a report dated 1695, mentions "Chicagou" and explicitly states that the name signified "river of the wild onion." Again, an English treaty with the Indians in 1773 refers to "Chicagou or Garlick Creek."

The name Chicago, through all the vicissitudes of spasmodic pioneering, Indian warfare, the war between the French and English, and the American Revolution, stuck to the creek and portage at the southwestern extremity of Lake Michigan. In various crude spellings it appears on maps and documents all through the more than one hundred years which elapsed between the time of La Salle's letter of 1683 and the establishment of Fort Dearborn in 1803.

Long before the end of the eighteenth century there were already several more or less permanent residents on the site of Chicago, but there was only one building which could be dignified by the title of "house." This was the structure which became famous in after years as the Kinzie dwelling. It stood on the north side of the river, near the mouth, and directly opposite the point where the fort was later built; in other words, about at the northern abutment of the magnificent new Michigan boulevard Link Bridge.

In the early history of Chicago, one of the greatest "melting pots" on the continent today, we find significant foreshadowings of that cosmopolitanism which was to become one of its most distinguishing characteristics. Indians, French, English, French-Indian and English-Indian crossbreeds and Americans of a variety of racial origins figure in the chronicle of those days.

Most interesting of all, however, is the fact that the first "white man" (using the term in a broad sense) to establish himself in Chicago and build a substantial house there was a black man. This individual was named Jean Baptiste Point de Saible; he hailed from the French West Indies, and apparently had come up the Mississippi by way of New Orleans and the French settlements along the river.

It was some time before 1779 that De Saible erected the comfortable house at the mouth of the Chicago River which later became the home of John Kinzie. De Saible had acquired a fortune in the Indian trade. He is described by an early Chicago pioneer who remembered him as "pretty wealthy," and it is added that he "drank freely."

When De Saible settled at Chicago, the territory had passed out of the hands of France and into the possession of England. The British commander at Mackinac, Colonel De Peyster, seems to have kept a watch on De Saible, whom he reported as being "much in the French interest." De Saible, however, was not molested, and

The wild onion, Chi-kaug-ong, from which Chicago took its name, and which still flourishes in the vicinity.

The Old Kinzie House, Chicago.

Manhattan Goes to See World War Plays

Lurid Dramas Which Recall the Days of Mud, Misery, Machine Guns and Massacre

Glory and Grog Accessories of Emotional Romances of Pre-Armistice Days

By PETER SCHUYLER

"ON THE eleventh hour of the eleventh day of the eleventh month" of 1918 the Great War ended. As a topic for the Manhattan stage it has just commenced. Already there have been major actions, gas attacks, retreats, and much very bad language. Of course The Wisest (?) City in the World had a few stray breaths from the battlefields before but they have been only breaths. "Three Faces East" was a spy drama in an English setting; "The Better 'Ole" was a roaring comedy of the shell holes; the other "war plays" were simply pegs upon which enterprising dramatists hung an assortment of tattered theatrical ideas in the effort to acquire a few dollars from a frenzied nation. Until "What Price Glory?" burst on the Manhattan showgoers the citizenry of the island for a real knowledge of the fray had to content itself with parades of returned divisions from the other side, scandals connected with the operation of the Veterans Bureau, and the contemplation of neighborhood casualties. The play at the Plymouth Theater has brought the war home to Manhattan with a bang.

Dirt, Blood and Degradation

IT WAS written by two newspapermen, Maxwell Anderson and Laurence Stallings. Mr. Stallings served as an officer in the Marine Corps and lost a leg "over there." Evidently he knows something about what he has written. Evidently also, the loss of his leg has not deprived him of his kick. The result is a disillusionizing picture of war for those who need disillusionment and an attempted stripping off of all the fancy frippery that is supposed to go with it. Here are no blaring bands, no fluttering flags, no lovely nurses pillowing wounded soldiers in their sheltering arms. It is all dirt, blood, degradation, and futility. By the same token, it is the most incredibly overestimated play which Manhattan has seen in a long time and a totally unsatisfying one. It has been declared by its hysterical admirers as a smashing attack on the common concept of the glory of the soldier's life. It has been the object of an attack by governmental officials because it was supposed to be bringing the uniform of the American soldier into disgrace and disrepute. It has been censored by the local watchdogs of Manhattan stage morality as a stench crying to the city hall for removal. The net—and perhaps expected—result has been to pack the Plymouth Theater to the doors at every performance, to make ridiculous the dignity of the municipal and governmental big wigs, and to do nothing else except attract a lot of silly people to a play, which, under the best of conditions, should never receive more than vagrant interest. That it will end any or all war is doubtful. At the head of the street whereon "What Price Glory?" is located there is a recruiting station for a field artillery regiment which seems to be doing good business, night and day.

The Captain and the Sergeant

TRUTHFULLY speaking, "What Price Glory?" is no more a war play than is "Camille." It might just as well have been called "What Price Ladies?" "What Price Cognac?" or what price anything. True, the characters in it are soldiers but they are not concerned about the fighting or the winning of the war. The battle rages, between a lieutenant of marines and the top sergeant of his company, for the favor of a blowzy French maiden, the daughter of the village saloon keeper. The enmity between the two men is not engendered by this one item, nor confined to an area back of the lines in France. Wherever this particular detachment of battleship policemen has served there has always broken out a bitter feud between captain and sergeant. And always over a woman. The captain wins his shoulder bars in the course of time. The sergeant is "busted" repeatedly but he always manages to capture the ladies at issue from his superior. Then they meet in France and the perennial conflict is renewed. The course of this affair constitutes the story of the play. There is no drama in it but much grand and lofty profanity between the warring suitors. The dear old war is dragged in to make atmosphere and a cellar in a disputed town is turned into a lecture hall where the differing viewpoints of the professional soldiers are exposed. The talk drifts from the existence of the soul to topics expletively military. Soldiers die—center stage—the sergeant gets a flesh wound and a ticket to the rear where rests the blowzy French maiden who is beautifully indifferent which of her admirers survives the ordeal of fire, cognac, and the military police. The high moment of the evening arrives when the captain comes back from the line, very drunk, and finds his light-o-love seated on the top sergeant's sound knee. The sergeant is also drunk. Both gentlemen get drunker and decide that things have come to such an amatory impasse that they must shoot it out. So they play "blackjack"—a further proof that this is a real war play—and the winner is to get possession of a Colt's .45 which he is to have the right to empty into the loser while that unhappy individual is trying to break all existing sprinting records down the road.

For once the captain wins but the sergeant escapes. Before the blowzy French maiden has the chance to reward the victor his company is ordered back into the line and the disappointed captain, drunk and all, has to lead his exhausted warriors back to the killing of more Germans. Right here is the spot in which the authors rise to heights of patriotism never reached by that well-known press agent of "The Star Spangled Banner," George M. Cohan. As the woozy captain staggers to the head of the column to start on the way to his bloody job leaving the blowzy French maiden to the alcoholic embrace of the top sergeant, the latter, filled with the widely advertised spirit of the marines, also staggers off to tag onto the rear of the column. This despite the fact that he is clad only in a pair of Red Cross pajama pants and a "salvaged" French smock. No gas mask, no "hump," no equipment, no tin hat, none of the regulation advance equipment has Sergeant Quirt. He has not even a grenade in the pocket of his Red Cross pajama pants. But full of fight, grog, and the yearning for glory, he staggers on to join his outfit, abandoning the blowzy French maiden to the next batch of replacements coming up the line. Perhaps Messrs. Stallings and Anderson wished to convey the impression that it was to be the "top kick's" last quest for glory. Certainly they send him out to fight the Boche as poorly stocked with weapons as ever was a soldier, even on the Manhattan stage.

Telling It to the Marines

AS may be imagined the play was received with a whoop of delight by the critics who rejoiced at the "vigor," the "unusualness," and "the strength" of the piece. One of the best known of the first-night chroniclers fainted dead away in his report from sheer ecstacy of emotion. Ladies, who don't mind bad language when they have to pay three dollars and thirty cents an evening to hear it but who call the nearest cop when they have to listen to the angry dialog of teamsters caught in a Manhattan traffic jam, flocked to the theater. A lot of ex-service men attended to hear once again the old familiar strains of combat zone conversation. The curious, the prurient, the sensation seekers assembled in paying quantity because they are just that, and "What Price Glory?" became overnight the one and only dramatic success in town. It is reported that Arthur Hopkins, who also produced Eugene O'Neill's luridly lined, "The Hairy Ape," exhibiting an unsuspected inferiority complex, printed a note of quasi-apology for the language used by the playwrights in the first-night programs. Mr. Hopkins is not bashful in the cause of the freedom of the artistic conscience but he doubtless disliked to bring the police about his ears before the show got a running start. Or it may have been the showmanship of the day which is prone to warn its audiences that they are about to see something pretty stiff.

The discriminating few, after seeing the drama, say, "If this is one of the results of war we are for everlasting peace."

That the authors of "What Price Glory?" have taken advantage of what is called "stage license" is apparent to anyone who saw even a little bit of the Big Show. No place on earth except on the platform of a theater does a captain stand in his company headquarters, exchange sarcastic comments with a brigadier general, and score laughs at the expense of his superior. Perhaps that sort of thing goes on in the marines but it is a trifle too much to believe. The blistering conversation between the captain and his top sergeant could, and probably would, happen especially since they had for years been both non-commissioned officers between whom rank was a simple matter of good or bad luck, being "made" or being busted. As presented by Mr. Hopkins and as written by Messrs. Stallings and Anderson "What Price Glory?" most of the time bears an intimate relationship to that variety burlesque of a decade ago, "The Battle of Too Soon."

His Hated Rival

THE other "war drama" which has engaged the attention of Manhattanites is an importation from England called "Havoc." It was a great success in London—where the original company was dutifully left. "Havoc" is the same sort of piece as "What Price Glory?" inasmuch as "the Front" is used to stimulate interest in the story. A society butterfly has the habit of getting engaged to the officer in the Sam Brown belt nearest her. When the happy man gets back to his job the butterfly sends him a note, on robin's egg blue stationery, saying that she has made a mistake and that she really doesn't love him. When the play opens the butterfly has got herself caught in an engagement with a Captain Dunton, a soldier by profession and inclination. On leave to London comes Lieutenant Chappell, a subordinate of Dunton's and his bosom friend. He is also an old sweetheart of the butterfly. She, having been disappointed in a dance appointment, proceeds to fan into flame the almost dead fire of the lieutenant's affection. He, bound by a sense of fair play, comradely feeling, and *esprit de corps* tries to escape the lady's wiles. But she bowls him over and sends him back to his company commander with the news that he has taken the boss' place in her heart. The captain, like a true warrior, flies into a rage at his friend and wants to kill him. But since even in the Great War captains did not shoot their lieutenants over a lady's change of mind Dunton finds another way to get rid of his rival. He orders him to hold a position when the order is to withdraw and practically condemns him to death because there are five thousand Germans on the job and less than a score of Britishers. But the playwright gets the blinded lieutenant through to the rear where the captain's little plot is disclosed. The latter, overcome with remorse when the lieutenant to save him, declares that he misunderstood the order, retires into the next room and conveniently blows out his brains. The blind lieutenant hunts up the society butterfly (who has just made a date on the telephone to go partying with a colonel) and after giving her a piece of his mind in which he asks her to consider the "havoc" she has wrought, is led out into sunshine and the married state by the sister of the captain who blew out his brains.

Women and Cognac

IT CAN be seen without very much effort that both "What Price Glory?" and "Havoc" are not war plays at all. If you believe their authors and follow the plots you are compelled to the conclusion that it is not poison gas, nor high explosives, nor flame throwers, nor "potato mashers," nor machine guns, nor rifles that do the really bloody work of war. It is women and cognac.

Everything however serves a purpose and "What Price Glory?" has done something. As a result of the blast of disapproval from the Brooklyn Navy Yard, the Department of Justice, Mayor Hylan's announcement chamber, and the police commissioner's dungeon on Mulbery street, the program at the Plymouth now contains the following note:

"I am presenting 'What Price Glory?' exactly as it has been given at the Plymouth Theater for every performance, except for the elimination of three expressions that are used in the best families and by our noblest public officials.

ARTHUR HOPKINS."

War certainly is what Sherman is supposed to have said it was—if you care to ask Mr. Hopkins.

The Fascinating Romance of Fort Dearborn

Concluded from page 12

when the Illinois territory became a part of the United States, in 1783, he lived on undisturbed in his home by the river. Altogether, De Saible resided in Chicago more than eighteen years, until 1797, when he sold his house to a French trader named Le Mai and took up his residence among the Peoria Indians, with whom he was on terms of great intimacy.

De Saible was practically the only permanent resident of Chicago when the American flag first flew over the Illinois territory, although at this time or shortly after there were one or two squatters round about. Nearby, a certain Pettell had occupied a cabin since 1790, while in the rear of De Saible's house a small building housed Antoine Ouilmette, a Frenchman, and his Indian wife, a member of the Potawatami tribe who some years later, under one of the Indian treaties, was awarded a tract of land fourteen miles north on the lake shore, where the aristocratic suburb of Wilmette now stands. Out on the north branch of the river a trader named Guarie maintained a post. Such was the population of Chicago and its environs when the United States began its history.

At last, in 1803, the United States Government decided to build a fort at the mouth of the Chicago River. At that time the most important frontier settlement was Detroit, and it was from Detroit that, early in the year just mentioned, the schooner *Tracy*, a U. S. Government vessel of ninety tons, set sail for the southern end of Lake Michigan with building material and supplies. A company of sixty-six men and three commissioned officers had been assigned to the new outpost. The small size of the vessel, however, made it necessary for all but the commanding officer, Captain John Whistler and his family, to make the trip overland, which they did, under Lieutenant James S. Swearingen.

The little vessel proceeded through the Straits of Mackinac and coasted down Lake Michigan, stopping at St. Joseph, where Captain Whistler and his family disembarked and rowed over to Chicago. The Whistler party consisted of the Captain and his wife, a grown-up son, Lieutenant William Whistler, just married, with his wife, and Captain Whistler's two-year-old son, George Washington Whistler. The schooner, the Whistler family, and the men who had come overland all reached Chicago about the same time.

In the person of Captain Whistler, the Irish may be said to have first arrived in Chicago. The Captain had had an extraordinary career. He was born in Ireland, had joined the British army, and was a member of one of the British regiments sent over by George III to put down the American Revolution. Captain Whistler was among the prisoners of war taken by the Americans when Burgoyne's army surrendered after the Battle of Saratoga in 1777.

He liked his captors and their country so well, however, that after peace was declared he decided to become an American citizen. He then settled in Maryland, where he married. Later he joined the American Army and was actively engaged in the Indian campaigns in the West. His naming of his younger son after George Washington shows his devotion to the country of his adoption. The Captain became the progenitor of a very distinguished family. The son, George Washington Whistler, was graduated from West Point and was later an engineer in the service of the Russian government. A daughter married the son of John Kinzie, the famous "first citizen" of Chicago. A grandson was the illustrious artist, James McNeill Whistler, who, while he lived in England, was always proud of the fact that, as he used to say, his grandfather "founded Chicago."

The honor of being the civilian founder of the modern city of Chicago is, however, generally accorded to John Kinzie, who, like Captain Whistler, had begun life as a British subject, having been born in Canada, about 1763, of Scotch parents. The name was originally McKenzie, but John's young playmates, finding McKenzie a difficult name to pronounce, were accustomed to call him "little Johnny Kinzie." When the boy grew up, he kept the name Kinzie. His father dying when John was young, the boy was taken by his mother and stepfather to New York. At ten years of age he worked his way back alone to Quebec, where he secured employment with a silversmith and in time became an expert in that craft.

Some years later the family moved to Detroit, where John now rejoined his relatives. He became greatly interested in the Indians, learned their language, won a warm place in their hearts, and soon established himself as a successful Indian trader. He built a number of trading posts, the farthest west of which was at St. Joseph, Michigan. From there he crossed to Chicago in 1804, bought the De Saible house from Le Mai, to which he added a veranda and planted four Lombardy poplars in front, and became the leading civilian resident.

John Kinzie, through his fair dealing with and brotherly spirit toward the Indians, exercised an extraordinary influence among them; so much so, that even when bloody wars were in progress he moved about in perfect safety. He was known by the Indian name of Shawneawkee, meaning "the silverman."

The name of "Dearborn," which was given to the little fort where Chicago now stands, is one of somewhat frequent occurrence in what was formerly the old Northwest Territory. Just as the United States is personified in Uncle Sam, and New York City in Father Knickerbocker, so Chicago in cartoon and story is represented by "Dad Dearborn."

It happens, strangely enough, that the man who has been thus signally honored, was never himself, so far as it is known, a resident of or even a visitor to the Northwest Territory.

General Henry Dearborn was, however, a distinguished officer in the Revolution. He was a native of New Hampshire, and as a young man took part in the Battle of Bunker Hill.

Nine years after the establishment of Fort Dearborn there occurred the dreadful event which is known in Chicago history as the Fort Dearborn Massacre. This was an incident of the War of 1812, which broke out in June of that year, and which in turn was involved with the Napoleonic Wars then raging in Europe. The Indians along the western frontier were largely in sympathy with England, the result being that the outlying American posts found themselves in great danger.

On July 29, 1812, General Hull, in charge of the American Northwestern Army at Detroit, dispatched a letter to Captain Heald, commanding at Fort Dearborn, in which he ordered the evacuation of the post. The letter read as follows:

> "It is with regret I order the evacuation of your post, owing to the want of provisions only, a neglect of the Commandant of Detroit. You will therefore destroy all arms and ammunition; but the goods of the Factory you may give to the friendly Indians who may be desirous of escorting you to Fort Wayne, and to the poor and needy of your post. I am informed this day that Mackinac and the Island of St. Joseph's will be evacuated on account of the scarcity of provisions, and I hope in my next to give you an account of the surrender of the British at Malden, as I expect 600 men here by the beginning of Sept. (Signed) Brigadier Gen. Hull."

Captain Heald, according to the wording of this letter, was left practically without discretion, and decided to carry out the instructions to the letter. The Indians were outwardly friendly, and Captain Heald bargained with them for an escort to Fort Wayne. Mr. Kinzie, who well understood the real temper of the Indians, was filled with foreboding and tried to convince the commander of the risk involved in leaving the fort under such conditions.

The Indians were greatly incensed by the destruction of the surplus arms and powder before the evacuation. The instructions were specific, however, and Captain Heald was resolved to obey them. And so, against the remonstrances of his officers, who regarded the adventure as certain death, he went ahead with his plans.

On the morning of August 15, 1812—a warm, sultry day—the little company, to the strains of the "Dead March," set out from the fort, which the Indians immediately fell upon and looted, wantonly shooting the cattle. Besides the men of the garrison, and a friendly Miami Indian escort which had come with a Captain Wells from Fort Wayne, there were a number of women and children, the younger ones riding in the wagons containing provisions and equipment.

The cavalcade made its way southward among the sand dunes, close to the lake shore, while the escort promised by the Potawatamis moved along some hundreds of yards to the west. John Kinzie had been warned by a friendly chief not to go with the party but to cross with his family by boat to St. Joseph. But Mr. Kinzie hoped that by his presence he might help to insure the safety of the company, and while he placed his family in the boat he himself went with the garrison. Ouilmette, with his family, remained at Chicago, being treated by the Indians as one of themselves and fearing no danger.

The procession had progressed only about two or three miles when the younger men of the Potawatamis could no longer be restrained; turning, they closed in upon the little company and began killing indiscriminately. The men resisted bravely, but their ammunition soon gave out and they were borne down by weight of numbers, while the friendly Miamis fled on their horses.

Space does not permit a detailed account of the many distressing scenes which that August day witnessed. Many of the company, both men and women, were killed outright, others were badly wounded, and, most pathetic of all, of the eighteen children, twelve were murdered and few of the others were ever heard of again. Further resistance being useless, a parley was held with the Indians and the survivors surrendered on the best terms obtainable. John Kinzie was of great service in helping the unfortunate survivors; Ouilmette, also, was able to assist some of the fugitives. The men who surrendered to the Indians were taken to Detroit, which was then in British hands, and became prisoners of war, suffering great hardship during the winter.

Among the little children in the wagons was an infant of six months. The others in that wagon were tomahawked, but this baby was saved by its mother having concealed it under a shawl. Mother and child spent some time as prisoners among the Indians but finally regained their liberty. The child grew up and after marriage moved to California, where, as a Mrs. Winans, she survived into the twentieth century, dying in 1903 at the age of more than ninety years.

During the continuance of the war, Chicago was left without a garrison. In 1815, however, peace was declared, the following year Fort Dearborn was rebuilt and remanned, and John Kinzie with his family returned to Chicago and reoccupied the old home. Mr. Kinzie survived until the year 1828, but it was not until the thirties that the old house, after half a century's existence, disappeared from view; while the fort itself held on until the middle of the century, when it was swept away by the rapidly growing city of Chicago, already echoing with the eloquence of Lincoln and Douglas.

An American City Which Declared a Dividend

Concluded from page 9

much a moral obligation as it is to levy a tax sufficient to meet the proper expenditures and obligations without piling up debts such as have so seriously impaired the credit of the City in the past.

"I believe, therefore, that it will be wise at this time to pass an appropriation ordinance refunding to the taxpayers 10 per cent of the amount of taxes paid this year, which would require an aggregate appropriation of $280,000 in round numbers. The total amount of the taxes assessed for this year, as it stood on July 25, was $2,747,573.32. The amount of taxes collected on account of 1924 tax abstract, as of July 25, was $519,473.30. The passage of the appropriation, then, would mean that approximately $52,000 would be returned in cash to those who have already paid their taxes, and approximately $228,000 would be rebated upon the tax bills as they are paid.

"Since the annual budget under our Charter must be made up in September or October, and since the tax assessment is not completed until the following June, it is impossible to fix a tax rate that will exactly represent the requirements of the City. Taking this rebate into consideration, the further accrual of revenue for the remainder of the fiscal year and savings in the expenditure under the budget will produce a surplus of revenue assets which the Council may apply when the actual amount is ascertained, to the reduction of next year's tax rate.

"Fortunately, the books and records of the City are now so kept that the exact status of the revenue and expenditures is automatically revealed every day.

"I have the honor, therefore, to recommend the passage of the emergency ordinance which is submitted herewith.

"Louis Brownlow, City Manager."

The city council after careful consideration approved these recommendations. So it was that a few days later the taxpayers of Knoxville received the following unusual communication:

"To the Taxpayers of Knoxville:

"The Council finds that partly by reason of underestimating the revenue to be expected and by reason of the efficient management of our administration officers and their diligent development of our various sources of revenue, the City has a surplus in its revenue assets. What the exact amount of this surplus will be at the end of the fiscal year cannot now be accurately determined, and the Council would prefer to deal with facts as they are now ascertained, and not base any action upon an estimate, however carefully made, of the operations of the remaining two months of the fiscal year.

"However, the Council has ascertained from the City Manager and the Director of Finance that additional revenues are accruing and that the expenditures will be less than was provided by the budget. It also finds from the certificate of the Director of Finance that there is at this time a surplus in accrued revenues of $300,000.00 in round numbers, already accrued, over and above all of the requirements to meet the budget in full, should every dollar be expended.

"The Council had nothing to guide it when it took office except the experience of the previous fiscal years and it made its estimates of revenues and expenditures accordingly, substantially reducing the expenditures at the outset and basing its estimate of the revenues upon the best obtainable information.

"Now that a modern system of municipal accounting has been installed and we are able to learn from day to day the exact financial status of the City, we find that we are able at this time to refund to the taxpayers 10 per cent of the amount of the tax levied. To those taxpayers who have already paid their taxes, this will be refunded by check; and those who have not yet paid will have 10 per cent deducted from the amount of the tax bill.

"We are glad to be able to make this refund, because we believe it to be our duty so to manage the affairs of the City that no more money will be taken from the taxpayers than is necessary economically to operate the business of the municipality, just as we believe that it is equally our obligation to levy a tax sufficient to meet the operating expenses of each fiscal year without piling up a deficit in the form of floating debt."

The new method of handling the city's finances was proving so successful that after this 10 per cent dividend was declared, it became evident that further benefits to the taxpayers would be forthcoming.

"Revenues to accrue during the remainder of the fiscal year, and savings on account of under-expenditures in the budget," says Mr. Brownlow, "will bring the city to the end of the fiscal year with a surplus of approximately $300,000 in its current realizable assets, and make possible a reduction of the tax rate for next year to $2.10."

One of the most interesting features of the system now in vogue at Knoxville is the daily financial statement showing the exact condition of the city's finances, for the information of the taxpayers—a statement so simple and clear that all who run may read and understand.

In the Knoxville daily papers of August 3 the city published, in a double-page spread, a copy of the municipal financial statement, as of July 26. The statement was accompanied by the following explanatory preface, signed by John C. Bordens, director of finance:

"How Your City Keeps Its Books.

"Daily Financial Statement,

"City of Knoxville,

"Covering Fiscal Year to Saturday, July 26, 1924.

"The City Council was able to refund 10 per cent of this year's taxes, thereby reducing the tax rate in effect from $2.44 to $2.196 because it had exact information of the financial state of the city. This information was obtainable only because the new system of bookkeeping produces a daily report showing how the City's affairs stand at the close of every day's business.

"Your bank knows how much money you have on deposit every day.

"Any taxpayer can now know where the City's business stands every day."

International Science Briefs

By DR. ARVID REUTERDAHL
President, Ramsey Institute of Technology, St. Paul, Minnesota.

Work of the Forest Products Laboratory

CARLILE P. WINSLOW, director of the Forest Products Laboratory.

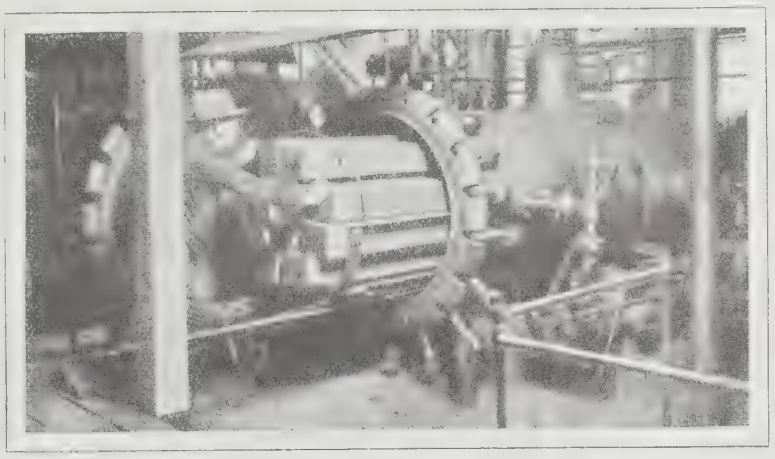
OUR country is a consumer of vast quantities of raw material. As a nation we are reckless in our use of Nature's generous donations to our comfort and well-being. Periodically, protesting voices are heard against this dangerous lavishness of those material essentials which constitute the very backbone of modern life. Nature is an inexorable banker. Some day, if we persist in withdrawing our funds from the bank, *Nature,* without making systematic deposits, of at least sufficient magnitude to neutralize our withdrawals, we will find ourselves without funds and our account with this relentless banker will be permanently closed.

William B. Greeley, Forester, United States Forest Service, is the authority for the following statements: "We need six and one-quarter million cords of wood a year to make our newspapers, magazines, books, pasteboard boxes, and other products manufactured from wood pulp. We are meeting this need at present only by importing a third of our paper or paper-making material from Canada. We require from one hundred to one hundred twenty-five million railroad ties each year to keep up and extend our railroad lines, aside from enormous quantities of timber used in other forms for railroad construction and the building of cars. At least six billion feet of timber is necessary yearly for boxes, crates, and barrels, a requirement which is steadily increasing. All told, we demand of our forests about fifty-six billion feet of timber yearly, aside from well over one hundred million cords of small material for fuel and various chemical products. There is nothing comparable to this enormous use of wood in the history of the world.

"The original forests of the United States are supposed to have covered eight hundred twenty-two million acres. Over two-thirds of this area has been culled, cut-over, or burnt. There are left today about four hundred sixty-three million acres of forest and cut-over land of all sorts, which contain about two thousand two hundred and fourteen billion feet of timber of merchantable sizes. Three-fifths of the timber originally in the United States is gone. All told we are taking about five times the amount of wood out of our forests every year that we are growing in them. We are cutting more of every class of timber than we are growing. We are using up the trees too small for the sawmill, but upon which our future lumber supply depends, three and one-half times as fast as they are being produced. Of still greater significance is the fact that the timber left is not in the right place. The crux of timber depletion is the exhaustion, or partial exhaustion, of the forests most available to the great bulk of our population, agriculture, and manufactures."

These statements, quoted in full because of their importance, coming from an authority like Mr. Greeley, ought to arouse our nation to a solemn realization of the dangers involved in the continuation of frenzied and uncurbed extravagance. If the national consciousness is once thoroughly awakened to the perils involved in this heedless waste then the ravages of this disease will be checked by the application of the remedy which has long been known.

Honest and unselfish scientists, engaged in the study and dissemination of the truth concerning the ignorant waste of raw materials, are missionaries that force us to consider the great problems of human existence impartially and independently of temporary private gain at the expense of the whole and the long run.



Preservative treatment of ties at the Forest Products Laboratory. Ties entering the preservation cylinder.

Not long ago the writer had the opportunity to hear a discourse on the subject of the intelligent, that is, scientific, use of forest products. The man who delivered the address was a scientific missionary sent out by the Forest Products Laboratory located at Madison, Wisconsin. The writer refers to R. C. Tuttle, one of whose principal duties consists in informing our citizens about the great work—great, because it is intelligent and good—done by the Forest Products Laboratory. Through the foresight of one of America's most progressive universities, the University of Wisconsin, this branch of our Forest Service was provided with a home in a building erected by this institution. The present director of this eminently useful research laboratory is Carlile P. Winslow, to whom great credit is due for the excellent service rendered under the depressing difficulties of the grossly inadequate financial budget provided by our Federal Government. It is the duty of every citizen to insist that the Forest Products Laboratory and all similar departmental branches of our government are given adequate support. It is high time that such departments, which constitute the mainsprings of our national life, be liberated from the evil and depressing effects of corrupt political greed.

The following facts are stated in justification of our insistence that the Forest Products Laboratory has already earned its right to the appreciative support of every citizen of our country:

The timber used in building and construction annually costs about $200,000,000. The investigations and recommendations of the Forest Products Laboratory, in this item alone, have effected an annual saving of $4,000,000. A conservative estimate of the saving in shipment losses and damages is $1,000,000 a year. This research laboratory, through its development of water-resisting glues and plywood for airplanes saved the War Department $6,000,000 during the war period. Researches dealing with the use of hull fiber and second-cut cotton linters for pulp and paper have made available 200,000 tons for this purpose and have resulted in the establishment of large plants with potential production of 300 tons a day and an annual sales value of $15,000,000. Improved methods of turpentining developed by the Forest Service resulted in increased yields and less injury to timber with net savings, aggregating $4,000,000 a year. These items alone represent an aggregate saving and increase in production of $30,000,000 per annum.

A new use for wood waste was discovered by the members of the staff of the Forest Products Laboratory. It was found that ordinary white pine sawdust could be chemically transformed into a carbohydrate stock food, equivalent to one-half the food value of barley and similar stock foods. This new food, a miracle of chemical research, can be produced at a cost of about $7.00 a ton.

This laboratory is a national reservoir of facts which are constantly available to any of our citizens. The inadequate annual appropriations made by the Congress of the United States, are, however, insufficient for the proper support of this eminently valuable departmental work.

At the present time the Forest Products Laboratory is equipped to conduct intensive research in all lines of wood utilization. It is, moreover, the only organization of this kind in the country. Its cooperative service is available to industries at a minimum cost. This institution does not promote one product against another. Its purpose is directed, not toward exploitation of special interests, but to a far greater end which will enable the public, as well as the industries, to put wood to its best use. Another excellent feature of its program is the free dissemination, through its publications, of the result of the research work of the Laboratory, which is not subject to private patent.

There is no doubt that the timber resources of a country are among its most valuable assets, and in no country in the world are these resources of more importance than in the United States. The President has recently pointed out that unless there is a change in the manner of handling our supply of forest trees, the country will be practically denuded within another half-century.

It is not so very many years ago since trees were treated as so many gigantic weeds which had to be rooted up and burnt without rhyme or reason.

One of the miracles of chemistry—converting sawdust to a carbohydrate stock food having a food value equivalent to one-half that of barley.

Testing finished paper in the pulp and paper laboratory.

BRIEFLY TOLD

Policemen in New York City who "cuss out" citizens are fined one day's pay.

The average unemployment in the United States, year in and year out, is 10 to 12 per cent. In numbers, American unemployment affects from one to six million persons.

Ancient Egyptians had incubators for hatching chickens. The eggs were placed in temperate ovens and turned much as are those hatched in the modern incubator.

Last year organic heart disease killed nearly three times as many persons in New York City as did tuberculosis; more than twice as many as cancer; more than half again as many as pneumonia.

The first man to use electric lights on the American stage was Bolossy Kiralfy, a veteran theatrical producer, who introduced this manner of lighting more than fifty years ago in his first New York playhouse. He was assisted by Thomas Edison, who has among his cherished possessions a program of that show on which appears, "Novel electric effects by the Edison Electric Light Company, under the personal direction of Mr. Thomas Edison."

Doctor A. Von Wilke, of Berlin, declares in an essay concerning international language that English is becoming the language used for that purpose. French, which has been used in former times, is losing its prominence.

It has been discovered by an archeologist that gloves were worn by both the ancient Egyptians and the ancient Hebrews.

So far as is known, the building which really deserves the distinction of being the largest building in the world is the eight-story warehouse of the United States army base in Brooklyn. It contains fifty-two acres of floor space, nearly twice that of the Equitable Building in New York City.

Approximately twenty thousand elephants are killed annually for their ivory.

Their financial allowance suddenly cut off by the war in China, many Chinese students in the United States who depended on the Boxer indemnity money to carry them through college are now seeking part-time employment so they can stay in school. This affects about four hundred and twenty-five students.

Drops of water, asserted by natural scientists to be more than ten million years old, preserved in quartz, is exhibited in Field Museum, Chicago. The water is clear and sparkling in its crystal container. It was found imprisoned in crystal quartz in rock formations near Bahi, Brazil.

The Rev. Dr. Charles D. Dane, pastor of St. Mark's Congregational Church in New York City, has resigned because "an active minority in the church insists upon desecrating the house of God by using it for modern mixed dancing," he announced.

"There is no glory in war, either in its conduct or method. . . . We know that war does not end war; that war is not a means of solving international disputes or bringing peace to a troubled world."—*Sir Arthur Curri,* former commander of the Canadian corps.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

A flawless emerald (and there are very few without flaws) is worth, carat for carat, three times the value of a similar diamond.

Flooded workings in a Pennsylvania coal mine gave a mule the first opportunity to view sunshine that he has had in fifteen years. He at first refused to budge from the conveyor that brought him to the sunlight and it required force to get him to his new lodging place, where he was afraid to venture forth for several days.

The opossum is the sole survivor in North America of the ancient race of comparatively unintelligent creatures known as marsupials—animals which carried their young after birth in a pouch or pocket.

Every twenty-eight minutes in the day and night a human life is sacrificed to violence in New York City.

President Alvaro Obregon of Mexico plans to reside and manage his plantations at Navojoa, Sonora, at the completion of his term of office.

When the Emir of Katsina visited the London Zoological Gardens the lions, hyenas and jackals rose up, began to growl, followed with their eyes every movement of the native chiefs, and from time to time made springs at the bars. The Emir was not surprised. "The lions know," he said, "that we are accustomed to hunt them."

Twelve-inch phonograph records that play for 100 minutes and reproduce entire operas by aid of radio loudspeakers without the noise of needle-scratching have been produced by an inventor of Berlin, Germany.

A shipment of 3,000 tons of corn from Argentina, received in Tacoma, Washington, revealed that corn from the South American Republic could be laid down in Washington cheaper than corn from Iowa.

"The whiter the bread, the sooner you're dead," is a catchy slogan that has a great deal of truth in it.

Columbus was seventy days coming to America in a ship weighing 100 tons and carrying a crew of fifty-two. Dr. Hugo Eckener in eighty hours came to America in an airship weighing ninety tons and capable of carrying a crew of eighty-three.

A new glacier with a mile-wide ice field has been discovered in the Olympic peninsula of Washington.

The deepest spot in any ocean has just been sounded in the Pacific about fifty miles off the Japanese coast. A Japanese warship has reported the lead sank to a depth of 32,644 feet, more than six and one-fourth miles, without touching bottom.

By a new French invention, the pilot of an airplane in case of accident pulls a lever, the fuselage opens like a big umbrella, and plane and passengers float down to earth.

An entire city block has been purchased on Washington Heights, New York City, the loftiest section of the metropolis, and a twenty-four story Romanesque cathedral known as Broadway Temple will be erected by the Methodist Episcopal Church. This will be a modern apartment house capable of housing five hundred persons, with playgrounds on the roof. The money derived from rentals will be put toward the cost of the building and to help other churches.

Thirty per cent of the fires in a downtown Manhattan wholesalers' district are of incendiary origin, according to Assistant Fire Chief Thomas J. J. Hayes. He says fires vary with the business seasons. When trade is brisk fires are few, but when goods cannot be sold they seek to sell them to the insurance companies by arson.

Recently a moose walked into the city of Montreal after wandering down from the Laurentian Mountains north of the city. He entered the thick woods on the slopes of the Riviere des Prairies, swam the river, and found himself in the heart of civilization.

Statistics of 78,500 oil wells drilled east of the Rocky Mountains in three years show that 83.78 per cent are of problematic value; that the big gushers are less than one per cent.

The origin of the term bootlegging had its inception in the West where sundry gentry peddled booze unlawfully among the Indians, carrying the liquid fire in the leg of their boots to conceal it from the Federal officers.

The habit of touching wood when we have boasted of our good luck is a throwback to the ancient tree worshipers. The primitive belief was that spirits resided in trees and wood was touched to call the attention of the tree spirit to the fact that his influence was recognized, and that he might not feel slighted and change good fortune into bad.

There are 30,000 different kinds of fishes in the Amazon rivers, among them many species found nowhere else.

An innovation that promises to revolutionize golf is the lighting of the courses by means of floodlight projectors, the artificial light being so brilliant that the players have no difficulty in following the balls.

It costs about $45,000 to build one mile of the best concrete road, twenty-four feet wide.

Mohammedans will eat no meat unless a prayer is uttered while one of their own religion cuts the throat of the animal.

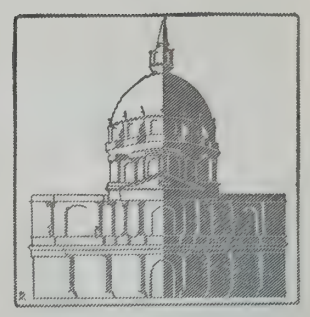
American Pilgrim in Paris

Seeing the Sights With Chauffeur as Guide; Almost a Duel in the Cathedral of Notre Dame



Dome des Invalides, Paris.

ALLAN L. BENSON

I SPEAK a little English, but no French. I was told in London that I would nevertheless have no trouble in Paris because taxicab drivers, waiters, clerks in the stores and thousands of others speak English.

The first man to whom I spoke after reaching Paris was a taxicab driver. I told him I wanted to go to the Hotel Chatham. He did not understand. I repeated the name, again and again. Apparently he had never heard of the place. As I continued to repeat the name, I wondered why anybody in London should be so stupid as to engage hotel accommodations for me at a place so obscure and perhaps so distant from the railroad station that Paris taxicab drivers had never heard of it. The driver finally called a chauffeur from another taxi and asked him if he could make anything out of my jumble of noises. He couldn't. But he had an idea. He produced a paper and pencil and handed them to me. While the two men looked over my shoulder, I printed in large capital letters:

H-O-T-E-L C-H-A-T-H-A-M

I had barely finished the last letter when the second driver, in a sort of "Oh,-I-am-beginning-to-understand-this-fathead" tone exclaimed: "Ah, ze Hotel Shot Tom."

The place I wanted was one of the best-known hotels in Paris, two blocks from the Grand Opera House, which is the center of everything. We were there in five minutes.

I soon found that there are two ways to make one's

"The driver called another chauffeur and asked him if he could make anything from my jumble of noises."

self understood in Paris—as far as vocal communication is concerned—to pick up what French words one can and mix them in with one's English, or to stick to English. At dinner, the first evening, I heard a stout American lady use about six times the only French word she knew and that settled me. "Oui" was her word. Forty-six words from the Mississippi Valley and then "Oui." "I'll have some filét of sole, salad with French dressing and a bottle of Evian, *oui.*" On every side, one heard such painful attempts to be French. I decided to take a tip from an old globe-trotter that I met in the Savage Club in London. "The reason," said he with a mischievous smile, "why English is spoken more than any other language in the world is because the English are so terribly obstinate. They refuse to speak any language but their own."

I refused to speak anything but English in Paris and the waiter who seemed not to understand soon got a terrible stare and the inquiry: "Don't you speak English?" I found no French waiter who would not admit that he spoke English perfectly; and, as a matter of fact, most of the hotel waiters did speak and understand sufficiently well to enable us to do business; but I kept out of restaurants unless I was with someone who could speak French.

The toughest bird I found, so far as speaking English was concerned, was a chauffeur with whom I spent my second day in Paris. After dinner, the evening of my arrival, I had ventured forth a few blocks from my hotel and, turning a corner, all at once the Place de la Concorde burst upon my view. The beauty of the spectacle was so overwhelming that I resolved to attempt to do no work until I had devoted a day to sightseeing. So I went back to the hotel and told the clerk that I wanted a car for the next day and a chauffeur who could speak English. At 9 o'clock the next morning, the car was at the door. I was apologetically told, however, that while the chauffeur could speak some English, he was not what might be called an expert at it. I soon discovered that this was but a very moderate statement of the fact. He could speak no more English than I could Chinese. But the hotel man gave him a list of places to visit and we started.

Our first stop was at the beautiful cathedral that is building at the highest point in Paris—the cathedral of the Sacred Heart, or Sacre-Coeur, as the French call it. I am not much interested in cathedrals, unless they are old enough to have an historic pull—and this one still smelled of mortar. But it was very impressive and I was glad of an opportunity to spend a few minutes in it. My French chauffeur, however, seemed to think that I had come to Paris particularly to see this place. He picked up an old man to act as a guide and we started on a tour of extended if not critical investigation. I was shown every nook and cranny of the place, which the old man, in very broken English, explained the best he could, and then taken to the basement. The basement was darker than pitch when we entered it, but the old man switched on a light from time to time as he pointed out beautiful marble statues of various past local dignitaries of the church. The old gentleman knew enough English so I could have stopped him at any time, but he was so very nice that I hadn't the heart to do it. I spent two hours in the place where I expected to remain 10 minutes—but I saw Sacre-Coeur. I'll say I did.

On our way out I asked my French chauffeur if he would take me to Napoleon's tomb. He looked at me in a dazed sort of way and I repeated the request. "Napoleon, Napoleon," I exclaimed, thinking he would understand the word and catch my idea. Nothing doing. Apparently he had never heard of Napoleon. "Then take me wherever you please," I added. He did not understand that, either, but he took me.

In a few minutes I was set down in front of what I recognized as the Cathedral of Notre Dame. By a few dexterous motions of the hands, shoulders and eyebrows, the chauffeur and I made each other understand that he would park his car and wait for me.

I stood outside a little while to look at this wonderful monument to a past age. The first stone was laid in 1163. The first generation that worked on the building lived, died and made way for the second. The second lived, died and made way for the third. So on for ten generations. The last workers could have said that their great-great grandfathers helped to build Notre Dame and still have omitted reference to several other generations who also helped. The work went on for almost 300 years. Christopher Columbus was perhaps a baby when the job was done. The same building that stands there on an island in the Seine was almost 300 years old when Washington was born.

I passed into the darkened interior. A guide flew to me like a piece of iron to a magnet. He was dressed in clerical garb. He was short, stout, round-faced and about 45 years old. He was pleasant, agreeable, informed, and spoke English well. Before we had gone far, I noticed that my guide seemed to be the object of some remarks from a Frenchman who was traveling with a party chaperoned by another guide. Soon the remarks grew into what seemed to be bordering upon a quarrel. They appeared to be slamming each other in French. Suddenly my guide shifted to English.

"What do I care what you think?" he said to the other fellow. "I have my customer here to attend to. I must speak English to him. You seem to think because you were wounded in the war that you can dictate to me. I also was wounded. I show you my papers. See them? I was wounded, too. If you do not like, I know how to handle a gun," and, pausing a second, he added, "as you do."

Great cats, what was about to happen—a challenge to a duel? Think of coming into Notre Dame, of all places in the world, and hearing men quarreling and hinting about broadcasting bullets at each other. I asked my guide what it was all about. He said the Frenchman was angry because he was speaking English to me. He had a guide who was speaking French to him, so the matter was not very clear to me. I set it down as one of the strange things that may happen to one when he is far from home and among people whom he does not understand.

To me, the most interesting thing in the cathedral was the place where Napoleon crowned himself and Josephine. It is in the center on a raised platform with a step or two leading to it. I saw a huge painting of the scene in the Louvre a day or two later and it was so true to detail that again I seemed standing in Notre Dame. In the cathedral, I also saw the robe that Napoleon wore at his coronation, while in the Louvre I saw his crown and one of his swords. At Versailles, I saw two of Napoleon's gorgeous carriages, laden with golden trappings and bearing the letter "N." One of these carriages was the one in which Napoleon and Marie Louise rode away after their marriage.

In Notre Dame is a collection of church jewels and gold plate that is equaled perhaps at no other place except the Vatican. My guide told me that I was very fortunate in being able to see these; at any rate, I saw them. One piece contained 700 diamonds, ranging in size from a bean up to a hickory nut, and a ruby in the center as large as a black walnut. After seeing so many jewels, the solid gold plates and things did not seem to amount to much. But the guide knew his business and, when interest was flagging, produced something to create a thrill. It was the golden chalice from which Louis XVI drank his last communion before he was taken away to be beheaded.

We left the chamber of jewels and gold to go back into the main body of the cathedral. The guide was pointing out the beautiful rose windows when he suddenly digressed to call attention to the fact that in one of the alcoves a wedding ceremony was taking place. He then told me that weddings take place in the cathedral every day. If the bride and groom don't amount to much, a small alcove in the rear for them. If they are almost somebody, they get a better place. If they are real people, with plenty of money, they face the preacher where Josephine faced Napoleon.

The rose windows are the most beautiful things in the cathedral. There are four of them, each 45 feet in diameter. Each is pieced together of innumerable bits of rose-colored glass. The effect of the sunlight falling through these tinted panes is exquisite. During the war, the French removed each of these pieces of glass and put them where the Germans could not shatter them.

As I came out, I saw my chauffeur sleeping behind the wheel of his car, waiting for me. I woke him up and away we went. After a mile or so, he suddenly let up on the gas, threw on the brakes and began pointing to a gilded dome on the left bank of the Seine. I tried to get what he said but couldn't understand a word of it. Finally, I made up my mind that he was telling me of something wonderful about the building with the gold dome and asking me if I did not want to visit it. I shook my head. Refusal seemed almost to drive him frantic. "Grand," "magnifique" were sandwiched in between every other word, and again he raised questioning eyes as to whether I would fall for what he wanted to show. I made a rapid calculation and came to the conclusion that this Frenchman was trying to lead me to another cathedral, and, knowing that nowhere in the world could there be another Notre Dame, I told him that I did not want to go. I shook my head and motioned him to go on. He went, but he was the sickest looking Frenchman that I ever saw. Plain disgust was written all over his face.

The next day, I found out what it was all about. He had been pointing to Napoleon's tomb and urging me to visit it and I wouldn't do it!

We continued on to the Bois de Boulogne, the great park of Paris, where I had luncheon at the Pre Catlan, a little marble palace, set in the woods, that serves as a restaurant. On the way, we passed through the Avenue de la President Wilson, a short residential street, with a statue of George Washington at one end of it. We also passed through the Rue Franklin on which Franklin lived when he was Minister to France during the American Revolution.

The Bois de Boulogne is quite different from American parks. It is really a forest with beautiful winding roads through it. It is on rolling ground and contains two small lakes. The woods are permitted to remain wild. There is no such display of ornamental flower beds as one would see in an American or an English park. In fact, there are but very few flowers. I think we have more beautiful parks in America than I saw in France or England. Detroit's Belle Isle, it seems to me, is the most beautiful of all, with Golden Gate Park, in San Francisco, second. St. James Park in London, with its lake, swans, flowers and trees impressed me more than the Bois de Boulogne.

The way back to Paris leads through the Arc de Triomphe and down the Champs Élysées, the most famous street in the French capital. The Arc de Triomphe, which was built by Napoleon to commemorate the victories of the "Grande Armee," makes our Washington arch in New York look pretty sick. The French arch is much larger and is so proportioned that it is impressive when one is standing near it or views it from a distance. It makes a splended picture when seen from a point far down the Champs Élysées. The Germans marched their army through it when they took Paris in 1870. Later the French draped a heavy chain around it so that this might not so easily happen again.

Under the left arch France's Unknown Soldier is buried. A flaming torch is set at the head of his grave. It is the duty of a government employe to keep oil in this torch so that it shall never go out. I stood beside it windy nights. The torch flickered but kept burning. It burns throughout all the storms of winter. It is the French idea that this eternal fire shall symbolize French memory—that it never forgets. Since the torch was lighted, the question has arisen in some minds whether it is a good thing. Men have wondered whether it may not cause France to remember some things that she might better forget—her eternal grudge against Germany. Maybe the torch is a good thing—at any rate, it has never gone out since it was lighted by the Minister of War three years ago and may burn for centuries.

The second and concluding installment of this article will appear next week.

"Paris exists chiefly to cater to tourists."

Elmer Bowman—"A Vanishing Species"

Veteran Louisiana Hunter Says That Game Is Making Its Last Stand

By MAX BENTLEY

FOUR little duck boats, in single file, turned from the main channel of the Sabine River and glided into the submerged forest on the Louisiana side. The dense palmetto stand marking the low east bank—submerged now as the spring rise came down—noiselessly parted to let the procession through, then closed again to swallow it from sight. With a quite human gesture the graceful green plants straightened up and shook the water from their fan-shaped spikes. They seemed to be standing watchful vigil for the dark forest host behind them.

The duck boats carried an expedition of muskrat hunters and buffalo fishermen: six professionals who lived there, and one prairie amateur. In the bow of the first boat, heading the procession by right of authority, was Elmer Bowman: seventy, grizzled and leathery, but marvelously wise in the ways of Nature's wild folk, and wielding his paddle like a boy. His followers were his two sons, Robbie, the elder and next in line of succession, and the boy Homer, aged fourteen; two sons-in-law, Hudson Larison and Henry Underwood; Hudson's father, Mister Larison; and the prairie amateur, myself. We were loaded down with rat traps, hoop nets, trot lines, lanterns, thermos bottles, and sharp knives. A day of action was ahead. At midnight Louisiana would clamp down on the Elmer Bowman fisher-hunter-trapper colony, and on the 10,000 other fur trappers of the state, with her annual nine months' closed season.

The fish were "knocking" that day. Elmer confidently led the way down a sun-speckled avenue of gums, maples and swamp dogwoods, and tied up to a tall cypress bearing the initials, roughly burnt into the bark, "E. B." This section of the submerged forest was Elmer's domain—leased land for whose trapping and fishing privileges he paid 10 per cent of his catch. In no time Robbie Bowman had two dozen traps set, nets were swishing through the water, and fifteen-pound buffalo fish were being dropped into an improvised "hog pen" made with wire netting strung from our island out around a group of trees in the shallow water nearby.

The buffalo is a stupid hog-mouthed blunderer that wallows into your net and inertly hangs there until you take him out. He grows to size and not to reason. A dozen big buffalo will fill a duck boat to the swamping point, and lie there with no more show of resistance than a feeble waving of gills and tails. And yet, I saw Henry Underwood extract the heart of one captive. He carelessly tossed it into the growing heap of bloody fish refuse whence I rescued it and placed it on a stump. The great thing beat steadily for forty-five minutes before it suddenly fluttered and failed—one beat a second, drawing itself up between every beat with a peculiar violent indrawing resembling nothing so startlingly as a shudder of agony and reproach.

Elmer and I talked of many things.

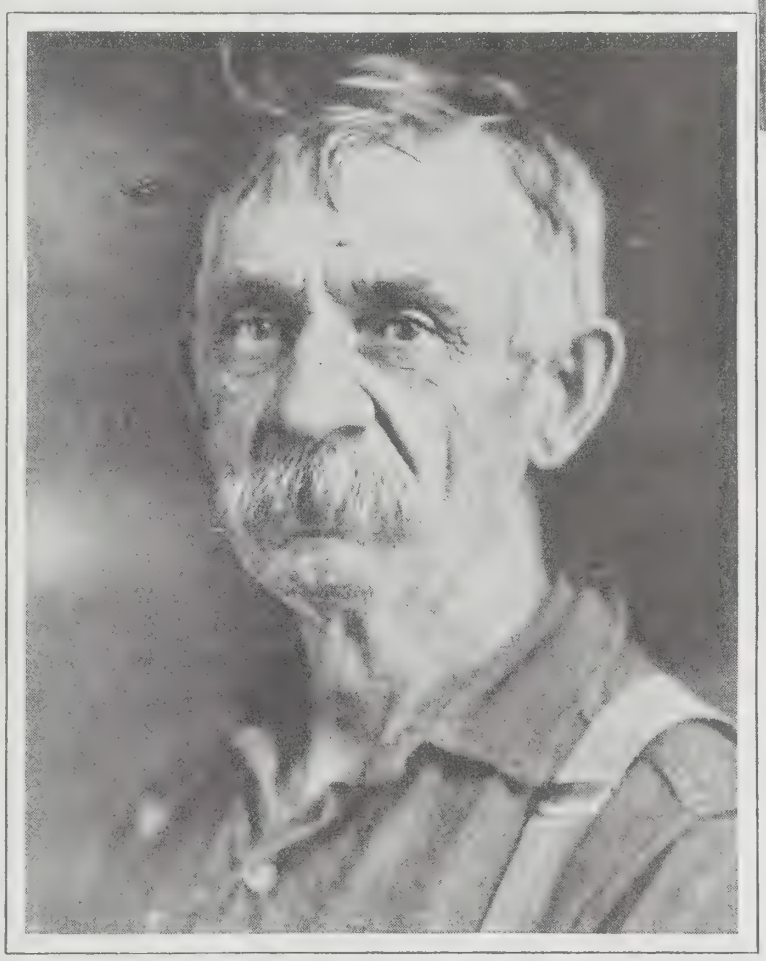
"Our last day," he said regretfully. "Of course the fish had to start knockin' today. It's hard on us that observe the law. Here's the season ending on rats and coon and fifteenth of February, just when the fur is getting prime. Louisiana clamps down on you, but along comes Texas without a single law. I take the trouble to get a permit from Louisiana to trap till the first of March, but these French *cajans* will slide over to the Texas side and trap till summer, taking the old shes full of young. Rats litter down here four or five times a year, but those fellows never consider that. They catch 'em in season and out season. When the buffaler fish begins to spawn and shoves over to the deeper water of the Texas side, them fellows will follow and make a killing; and when I start fishin' again April fifteenth there won't be none left. What's a law-abidin' family like ours to do? We trap and fish for our living—I've got a menagerie of fifteen people on my hands—and it's hard to see those poachers slide in under us."

"Why don't you slide over to Texas, too?" I inquired. Elmer looked at me solemnly.

"I've trapped right here for twenty-three years," he said. "Most of my children was born on this river. My married darters and their children lives in this fleet. In Indiany, whar I was born, I trapped as a lad and stuck to it till the game was all gone, and then I followed it south. When I come down here there never was such a place for game. Millions of rats and coons and possums and mink and skunk. All the rivers was crowded with fish. The Canada goose was so thick you could knock him down with an oar. I've seen the sky black for two miles square with ducks and geese going home in the spring. Things would stay like that if Texas would hook up with Louisiana and protect the game, but Texas hasn't done a durned thing. Right here the game is making its last stand. It can't go south, the Gulf's in the way, so what's left is headed west for Texas, and God help 'em."

Elmer did not put his figures too strongly. The Louisiana and Texas lowlands where roam the Bowmans are the last refuge, on a large scale, of the wild fur bearers which once thronged this continent. Remnants of the species, responding to some instinct which bade them desert their ancestral haunts before extinction overtook them, followed the great rivers southward, finally reaching the Mississippi delta in terribly diminished numbers. They have pushed on to a new home which, while it may lack much in satisfying the eye—even the eye of an animal—is, at the same time, as near man-proof as a beneficent Nature and Louisiana's fine conservation laws can make it.

It is a land of reedy marshes; of tidewater swamps and lakes; of wide rivers with low banks and great estuaries and deltas; crowded with stands of alluvial hardwoods whose branches interlace as their water-soaked roots give them tremendous height and limb spread and all but blot out the sun. "Rich in the complexity of its ancient forest growth, the bewildering labyrinths of its bayous, its tangled thickets of palmetto and sedges and grasses, its uncertain lights and shadows," it is at once hostile to the lust of the indiscriminate killer and friendly to the fleeing wild life, especially the water-loving species.



Elmer Bowman, a professional hunter, fisher, trapper of the Louisiana marshes.

The muskrat breeds prodigiously in the marshes. Great numbers—millions annually—are taken by the trappers for their fur. If the marsh is the natural home of the muskrat, the gaunt *cajan,* with his melancholy eyes and soft speech, finds in it something which satisfies his yearning for a pastoral solitude such as his ancestors knew, in a happier day, in their beloved Acadie. Being French, he is a natural trapper. If it was not a foreknowledge of the appearance of Southern Louisiana (picked up, perchance, from some roving sea captain), surely it was instinct that led thither a handful of the little band of Grand Pre exiles dispersed to the winds by their British conquerors in 1755. Their descendants have clung to the French speech, but curiously mixing its liquid smoothness with bits of terse and matter-of-fact English, and producing what one would be tempted to call a jargon if it were not so musical. Elmer Bowman himself is not French, nor *cajan* French, but most of the 10,000 Louisianians engaged in setting and running traps are.

It is not only the rat which propagates in vast numbers: for sheer prodigality of wild life of every species indigenous to a temperate wet climate the coastal belt joining Louisiana and Texas is not equaled by any large stretch anywhere on this continent. In the spring and autumn of the year floods on the rivers—peculiarly on the low-banked Sabine—interpose an effectual bar to the unlicensed hunter, and allow the water-loving animals to increase uninterruptedly. The fur-bearing species lack much in richness and luster of pelt, since the climate is balmy throughout the year barring an occasional "norther," but they make it up in frank numbers.

As for rats, the catch must be made quickly or not at all because the climate *is* so mild and rainy. The rat is like the humankind: when the day is warm and wet he has the impulse to stay indoors, while a cold and clear day can be depended on to bring him out.

Trapping conditions are conspicuously dissimilar from those prevailing in the Far North. The Acadian trapper of Louisiana falls short of the heroic stature of the fiction-delineated "breed" of "God's Country"—the one running his traps so fleetly that the tail ornament of his squirrel cap stands out stiffly behind and is, on occasion, frozen thus by the poetically suggestive and meteorologically improbable "cracking silence." What the *cajan* lacks in physique, complexion and picturesqueness of adornment he overcomes in downright elbow grease. The cracking sound resounding through the Louisiana region is simply the herald of his progress as he flounders through the marsh.

Skinning muskrats.

He flounders through mud and water, and grasses and rushes so thickly woven together that, unless he knows how to lift his booted feet and where to lower them, he is liable to sit down suddenly and violently, and wet the seat of his breeches, and lose his traps along with his temper. Even without an avoidable mishap, not to lose one's traps is something of an art. A bit of marshland looks like every other bit, and the traps are laid just under the surface of the water and covered with debris; and even a seasoned trapper who "senses" the lay of the region through long residence will not deem it a loss of caste to tie red flannel rags to conspicuous reeds along his trap run.

Rat houses are built of reeds and stalks, and on flats—inversely, oases in the marsh. The premises are mowed as clean as a hay field, the resemblance to which is emphasized by stacks of collected vegetation topping, in rounded form, the under-water corridors and chambers. Entrances are strategically made from below the water line, while the chambers are above, the whole bearing a rough and makeshift resemblance to beaver houses, except that there is no hard mud covering. The entrances are merely holes in the mud. They are found at some distances from the houses, leading to them by well-tunneled labyrinths. Here Mother Rat raises her young and stores her food reserve of succulent cattail stems. Nature has endowed these aquatic rodents with webbed hind feet and laterally compressed tails which at once literally drive them through the water and regulate their direction. Thus endowed, and with such a vast habitat for their peculiar amphibious preference, they have increased in numbers rather than decreased.

Mink and raccoon prefer the higher lake region toward the interior; in the marshes they never acquire a heavy or glossy pelt. The matter of food, which is the first consideration of all animals from man down, governs their choice of a home. While they are fish eaters, their real preference is for corn, fruits, eggs, and even the flesh of poultry and birds. Early in the spring, when their young are born, they will not be found blundering into traps, but in dense swamp thickets with high, dry and hollow stumps suited to the needs of a growing family.

While the skunk gravitates to the hills or about small streams in dry and brushy country, the opossum claims for his propagation ground the semi-dry hammock lands in the first level above the swamps and marshes. The skunk is utterly indifferent of man (like the porcupine, he carries his protection with him), but the possum is a discreet little animal restricting his range to corn fields and potato patches near the hollow stump which gives him snug shelter.

The coastal islands fringing the Gulf of Mexico are an ideal breeding ground for wild fowl of which, only among the geese and duck and brant, the annual kill in Louisiana is from 2,000,000 to 3,000,000 birds. The land is mainly submerged woodland with close growths of rushes, grasses, sedges and reeds, interspersed with dense stands of cypress, tupelos, ash, maple and willow, and with contiguous mainland stretches of long-leaf pine flats wedging in from the north. The pine flats are remarkable for the blending of upland and swamp-loving birds, including the yellow-bellied cuckoo, red-bellied woodpecker, white-eyed vireo, hooded warbler, water thrush and snipe, with such dry-land habitants as the

When Co-operation Has No Strings to It

How Southern Rice-Growers Made a Big Success When Sapiro Was Left Out

By ROBERT MORGAN

No Sapiro co-operative organization studied in these columns has been a success. We are still waiting for word of one Sapiro group that is a success. Mr. Sapiro in his "come on" speeches usually refers to "the great success we made in California," but he never says that *he* made it or that it was made under his system. Honest and wise co-operation has its examples of success. Sapiro agents, misrepresenting the attitude of this paper, contend that we are against all co-operative movements. This is sheer untruth, as the record shows.

However, to bring a little cheerful variety into the gloomily monotonous story of Sapiro co-operative failures, we tell this week the story of a big co-operative success. Needless to say, it is not the story of a Sapiro group.

THE greatest cereal crop in the world is rice. Probably two-thirds of the population of the world depend upon it for the greater part of their daily food, many millions consuming as much as one pound a day each, the year around. Japan alone consumed, in the fiscal year of 1923-24, a total of 65,800,000 "koku," and a koku is 5.12 bushels, an aggregate of 336,896,000 bushels of rice. This is only a part of the vast quantity of rice consumed in the entire Orient, including China, Japan, India, Korea, Formosa, Indo-China, and the islands. By contrast, it may be said that the figures for the crop year of 1922-23—the last available—show that the people of the United States consumed 581,316,600 pounds, a per capita average of 5.29 pounds, as against the Oriental millions whose average annual consumption is 365 pounds or more per capita.

Four states in the United States produce approximately two billion pounds of rice a year. The exact figures for the 1922-23 crop of Arkansas, Louisiana, Texas, and California were 1,917,319,000 pounds, with other states of small production making up the balance. Of the crop just mentioned, 1,578,919,000 pounds were produced by the three southern states, and 338,400,000 pounds by California, virtually all of it in the Sacramento Valley.

The figures for the 1923-24 crop in the South are not at hand, but the California rice fields produced approximately 260,000,000 pounds of paddy in the last crop. The value of this crop, based on the average price of 2.8 cents a pound, was $7,280,000.

Had the crop in the southern states been sold at the same price, it would have brought to the grower $44,209,732, *but the southern crop was handled under the "fixed price," "orderly-marketing" plan of Aaron Sapiro,* with the result that it averaged 2.46 cents a pound as compared with the 2.82 cents actually obtained by the method followed by the Rice Growers' Association of California for its members.

Rice fields being flooded. Rice is the only cereal which requires a great amount of water during the early period of its growth and "heading."

This means that the Sapiro Plan cost the rice-producers of Louisiana, Arkansas, and Texas $5,368,325 on the 1922-23 crop, since they actually received for it $38,841,407, instead of the $44,209,732 they could have received had their crop been handled on the same system as that of the California rice-growers, a system, it should be said, which differs fundamentally and radically from that of the Sapiro Plan.

The Arkansas Rice Growers' Co-operative Association was started on January 26, 1921, as a farm bureau project, based on the Sapiro Plan. The Louisiana Farm Bureau Rice Growers' Co-operative Association was organized along the same lines early in 1922, and an association also based on the Sapiro Plan was put into operation in East Texas a little later. The Pacific Rice Growers' Association was organized in California in 1915. It is not clear that Aaron Sapiro, just then beginning to push himself forward as the savior of the American farmer, actually organized this association, but the one-year contract used had a basic resemblance to that formulated by him a year later for use in other co-operatives. In any event, after five years of varying degrees of grief, this association found itself up against the stone wall of refusal by the millers to deal with it. Reasons back of this refusal were partly economic, partly due to previous experiences of the millers with the association, and partly to fear in the minds of the millers as to uncertainty of prices.

In October, 1921, the members of the association decided to take matters into their own hands, resume control of their association, and reorganize it for their own benefit. This plan, when rigidly adhered to, and when carried out by competent men, has resulted in the reformation of some Sapiro Plan co-operatives; *but not all of them have been or can be so saved to the farmer.* Thus, the new Rice Growers' Association of California began operations in the autumn of 1921, with Ralph P. Merritt, later destined to save the raisin-growers of California from disaster, as president and general manager.

According to "Co-operative Marketing, the Golden Rule in Agriculture," before referred to in these articles as written by Herman Steen:

> "The old contract was replaced with one covering five years, the chief provisions of which were similar. Title in the rice was passed to the association on delivery, but the original plan of selling each lot separately was retained, as was also that of *referring all bids to growers before acceptance.* It would seem that this plan could not prevent dumping of rice on the market immediately after harvest, but it did. * * * * The association handled more than 1,500,000 bags (150,000,000 pounds) of the 1921 crop and sold them for an average of $2.65, *which was almost 40 cents per bag higher than was netted by unorganized rice growers in Texas and Louisiana.*"

Two factors of success in co-operative marketing thus were introduced immediately into the California rice-growing field by Mr. Merritt, one, that of selling each grower's rice separately, and, even more important, second, that of allowing the grower to accept or reject the price offered for his rice. These two features are never permitted in the Sapiro Plan associations, for if they were allowed, the producer would remain in control of his product and his association.

The Louisiana, Arkansas, and East Texas rice-growers are having troubles of their own with their Sapiro Plan organizations. The inside story of these associations has not been told; indeed, it is doubtful if that of the Arkansas organization ever will be made clear, even to its own members, but the general history of disaster which has followed other Sapiro Plan co-operative marketing associations will be the same in the southern states. It is obvious from correspondence in the hands of the writer that the rice-growers of the South do not yet know why they have received nearly half a cent a pound less for their rice than did their California brothers.

The history of the Rice Growers' Association of California, since its reorganization in 1921, however, is one of success, based on accurate, honest, fair business methods, and the realization that no bargain is good unless it is fair to both sides.

The result of this different method of operation became apparent at the end of the first year in which it was tried. In the crop year of 1919-1920, the average operating *loss* a month was $2,993.61, or $35,923.32 for the year. In the crop year of 1920-21, the operating *loss* fell from the above figure to $301.59 a month, or about $3 600 a year, but the operating expense increased from $7,993.61 a month to $10,958.20 a month. To carry these figures further, the average operating *loss* for this association from September, 1920, to October, 1921, when the reorganization was accomplished, was $2,585.88 a month, on an average operating expense of $10,796.89. That is to say, on an operating expense of $129,562.68 for the year, the loss to the rice-growers was $31,030.56, or approximately *24 per cent.*

But when the association was reorganized, put on a business basis, and taken away from the theoretically correct but practically unsound methods under which it had been operating, these changes occurred:

From October, 1921, to the end of June, 1922, operating expenses were reduced from $10,796.89 a month of the preceding year, to $7,255.55 a month, and the operating loss which had handicapped the association for the past two and one-half years or more, was converted into an operating *surplus* of $1,957.02 a month. From the end of June, 1922, to the end of June, 1923, this operating *surplus* averaged $1,040.19 a month, while the average operating expense a month was reduced again, this time to $6,397.14. From the end of June, 1923, to the end of June, 1924, the operating *surplus* averaged $446.26 a month, while the average monthly operating expense was cut *more than $1,300,* to $5,055.09.

As has been brought out repeatedly in this series of articles, one of the principal causes of the uniform chain of disasters befalling the Sapiro Plan co-operative marketing associations has been extravagance and waste, in operating expenditures. The above figures, which are official, and taken from the 1924 Yearbook of the Rice Growers' Association of California, demonstrate clearly just what can be done with the operating expenses of a co-operative association when men familiar with business methods, merchandising, and the direction of workers, are put into the executive positions in such organizations, with free hands to correct the irregularities and incompetencies of the plan under which the associations are operating. That this revival of the rice association was no result of a combination of fortuitous circumstances is evidenced by the similar result obtained by the same man and his assistants in the raisin-growers' association, previously described in these columns. But it is unfortunate that the farmers of the United States should first have to sustain loss upon loss at the hands of Jewish managers before they turn to competent American business men and methods to regain for them the proceeds of their labor.

In resigning from the presidency of the rice-growers' organization to take on the work of restoring the raisin-growers' association, Mr. Merritt discussed the rice-growers' condition this year as follows:

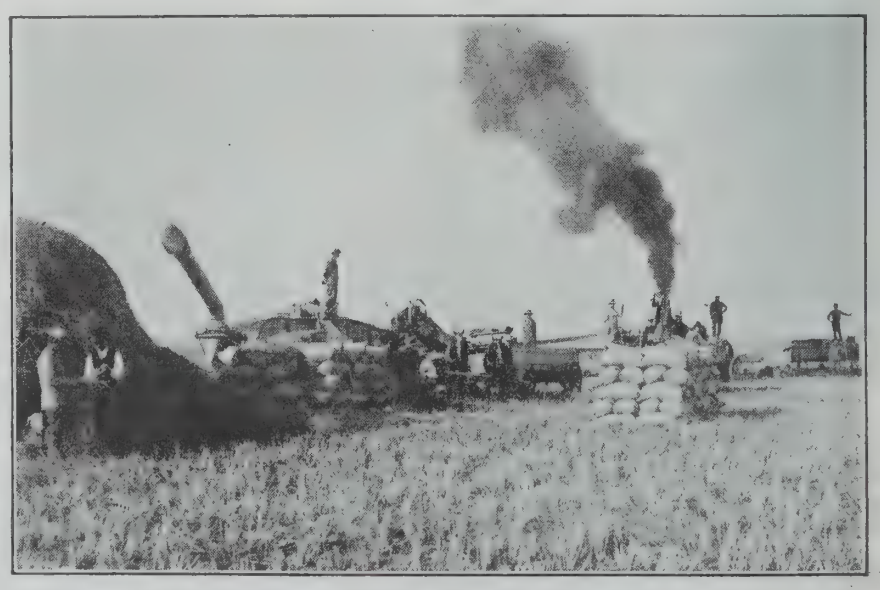
> "This organization was built upon co-operative principles applied to the needs of the industry. It was created overnight to meet an emergency which threatened the life of the rice industry, representing an annual income to the state of eight to ten millions of dollars. For three years, the Rice Growers' Association of California has acted as agent in loaning millions of dollars to its members, developing new and heretofore unknown markets for its product, creating the first accurate body of information obtainable anywhere in the world upon the values and volume of rice moving in the world, building its merchandising upon sound business principles, paying the debts of its predecessor organization, and reducing its own operating expenses, so that today its credit is established, its bills are paid, it has an available balance for future emergencies, and 90 per cent of the crop for this year—as of the last two years—is sold three months before the succeeding harvest."

"Co-operative marketing," continues Mr. Merritt in the same letter to the board of directors of the rice-growers' association, "is the basis of salvation of the farmer, *but co-operative marketing involves a sacred trusteeship on the part of its leaders to guide wisely, speak courageously, and deal fairly with the membership, and with those with whom the organization has business dealings.*"

This, in a few words, summarizes the solution of the problem of co-operative marketing, whether it be of rice, potatoes, prunes, or eggs.

Price-fixing had no place in the program adopted by

(Concluded on page 14)



Threshing rice amid the stubble of the rice field. The threshing process for this, the largest cereal crop in the world, is not different from that for barley, wheat or other grain.

Shall Black or White Dominate South Africa?

White Civilization May Be Imperiled by the Teeming Native Population

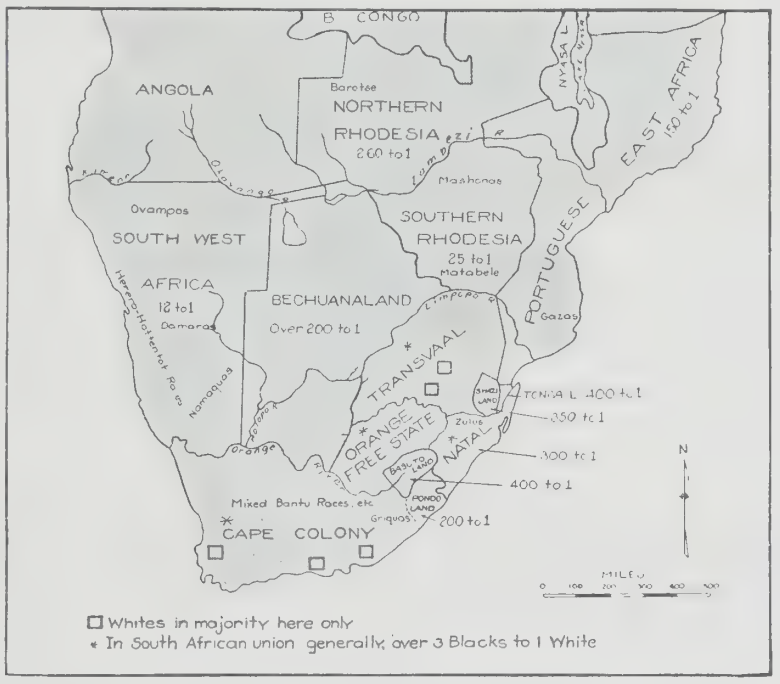
By THOMAS CAMERON TAYLOR

"THE Black Peril!" . . . . Some of the British newspapers have been carrying that heading lately, usually over quotations from colored publications issued in America and elsewhere. "We are 120,000,000 in Africa; the Whites are less than 2,000.000; why don't we drive them out?" As an example of the utterances which are claiming attention in Britain, the foregoing will suffice.

It is evident, however, that the new Nationalist administration which has emerged in South Africa is disturbed by its color problem. When Jan Smuts was overthrown, the tendency in comment was to emphasize his European activities, and the change in the complexion of the government even gave rise to questions as to whether the Union of South Africa would drop the British connection. To experienced Africanders who realize that Nationalism in South Africa now comprises large bodies of Dutch and British, and is less anti-British than just South African, the change in administration meant that South Africa had developed toward Europe—the whole of Europe—the American feeling, and was inclined to look more closely after her own affairs, being more interested in the future of South Africa than in the past of Europe.

While the electoral upturn showed that South African Labor had taken the first opportunity of striking back at the representatives of an administration which upon an exciting occasion had laid hold upon union funds and dealt with striking crowds in no tender manner, the Nationalism with which Labor was associated in bringing about a change of government is as old as the Great Trek and indicative of the merging of the White nationalities in South Africa which has been going on since the Boer War. Behind the new administration are powerful ultra-conservative or *back-veld* influences represented by the old Boer farming class, traditionally other than lily-handed in dealing with the subject races, and open in criticism of "British spoiling the Blacks." With grave problems affecting the huge native population of South Africa moving irresistibly toward that stage of clamancy, the declaration now made by the minister of justice of the Nationalist government assumes first importance: "The South African Government must do its duty in preserving White civilization in South Africa."

The challenge to the existence of White civilization which the Nationalist administration in South Africa now seems disposed to accept is not merely the challenge of numbers, important and even basic as that aspect of the matter is. Economic factors are operating. The effects of education—that forced and unbalancing "education" conferred by the Great War—are becoming apparent. Racial consciousness in the Blacks is deepening. Political possibilities are being impressed upon them from many sides. There is a stirring toward greater unity in the teeming masses, a recognition of a common interest. South Africa, in short, is facing very hard facts. That the aim of the new government is a large accession to the White population of the country may be gathered from another declaration made by the spokesman of the administration already quoted: "The mines must employ more White labor."



Map indicating the proportion of Black to White population in South Africa.

The challenge of numbers, however, is too great to be met other than partially, pending widespread industrial and irrigational development. Throughout the South African Union the Blacks are in a majority of 3 to 1, and their numbers are increasing rapidly, while there is no expansion of White population. In round numbers, there are 7,000,000 colored persons to 1,500,000 Whites. Great reserves, rapidly filling to overflowing with teeming thousands of vitally unimpaired Black peoples, are set upon the edges of the broad lands where the Whites are thinly scattered on quiet farm or in hamlet little less quiet. The large White contingents in the mining centers are offset in most cases by the concentrations of colored labor in these.

It is a startling fact that *only at five widely separated points are Whites in a majority in the whole of South Africa;* and it is now 272 years since Van Riebeek, a gallant Hollander, made the first White settlement there. A glance at the conditions in the important native territories will serve to show that while the general ratio of 3 Blacks to 1 White may hold good as far as the Union is concerned, the impression conveyed by those figures is misleading as an indication of the footing of the respective races.

Right in the center of the country lies Basutoland, the most highly organized and most powerful native district in South Africa. It does not belong to the Union, and it has raised in half a century a mighty people under what is practically self-government, the control of the Protectorate exercised direct from Downing Street being light. (By the way, when there was talk of the Nationalist government possibly dropping the British connection, no mention was made of the Basuto or of the fact that in the Boer War there were 100,000 men in Basutoland ready to take the field for the British, and surprised that they were not used.) Formed of tribes driven into the mountains by victorious Zulu legions, they were molded by Chief Moshesh into a people who later successfully defied the greatest of the Zulu generals.

Later still, the Basutos administered to the British probably the greatest lesson they ever received in South Africa. It came at a time when the British were claiming sovereignty over the trekking Boers wherever they went, and the lesson of the hard struggle between British and Basutos was that without the co-operation of the Whites in all the newly settled areas, the Whites in South Africa were lost; for the Boers looked on at the fighting, and, to put the matter mildly, did not assist in any way toward the security of the British supply lines. One of the results was the setting up of the Transvaal Republic.

The British have cherished Basutoland since then, and, thanks to enlightened chiefs, the people stand high in the scale of life. Basutoland is probably the only land in the world where prohibition is a fact. Packed into the 12,000 square miles of mountain and valley which constitute Basutoland are 500,000 persons, living in independence. *There are more than 400 Blacks to 1 White there.*

After a journey through Basutoland, the impression of a packed population of vigorous people remains dominant. Every long valley has its crops; each little patch of pasture has its contingent of hardy little ponies or cattle, sheep or goats—merry groups of urchins, very shiny of body and often innocent of clothing, guarding the animals. The hillsides are terraced for cultivation wherever that is humanly possible.

In the early dawn, when the smoke from the fires reveals the position of the clustering kraals perched on the slopes of the mountains, one realizes that Basutoland has not forgotten the fighting days, and needs every suitable patch of lower ground for the growing of food. *It is over half a century since Lerothodi decreed that no liquor of intoxicating character should enter the country.* In that time the population has trebled. A friendly people, clean. The necessity of employing some of the people at home has led to the opening up of coal and iron mines in the territory. *Basutoland has had a native press for more than thirty years.* "They are the Scots of South Africa," says a trader who has spent many years in their midst.

As an aggressive, fighting people, the neighboring Zulus have a record which places them easily first in South Africa, and they have earned a reputation which places them second to none in the matter of unreliability. "One never can tell" with the Zulus. A people that has lived by war, that has risen to undisputed sway thereby and gone down fighting, the Zulus are often troubled by memories of departed power. They have been in a measure slow to interest themselves sincerely or deeply in the things of peace, and have shown on occasion disturbing susceptibility to rhetoric and rumor. Against both Boers and British they have traditions of victory—victory short-lived—which do them no good. The Zulu outburst at the close of the Boer War is well remembered in South Africa.

To the northward, that branch of the Zulu people known as the Matabele provided a surprise just before the Boer War. "The Matabele and the Mashona will never unite, and neither can act alone. The Matabele has enslaved the Mashona, has treated him as a dog, regards him as such, and will never associate with him in any enterprise, least of all the noblest of Matabele enterprises—war." So ran the comforting legend in young Rhodesia till the lesson came, and the Africander remembers it always when there is talk of the security which may lie in tribal differences and traditions. When their "day" came, Mashona and Matabele swept Rhodesia as comrades in arms, and South Africa as a whole, politically riven as it was, did not fail to profit by the lesson of that remarkable alliance.

In Zululand proper, it has been estimated, there are about 300 Blacks to 1 White; in Southern Rhodesia, 25 to 1; in Northern Rhodesia, 260 to 1. The native affairs in the Union must always be a consideration of importance to Rhodesia, owing to the tribal affiliations of the Matabele and the Zulu.

All the problems outthrown by deepening race consciousness and extending native organization are very much to the fore now in the mind of the Africander, and he is anything but comfortably unconscious of his powerful neighbors, or comfortably trustful in the separation of native territories by large tracts of White country. On the east of him, the comparatively quiet Amapondomisi are estimated as being, in their special area, 200 to 1 White; the Swazis, 350 to 1; the Tongas, 400 to 1; the Gaza, farther up, 150 to 1. To westward the Bechuanas, 200 to 1, are still regarded as being under the spell of the late remarkable King Khama, and safe; and thence, right to the western seaboard, lies the Union's mandated territory, Southwest Africa, where it is estimated there are 12 Blacks to 1 White. The Herero peoples of Southwest Africa were discovered to have great fighting qualities, the discovery being made by the Germans at a cost of the lives of 5,000 German soldiers and $60,000,000. That was the most recent struggle participated in by a native race in South Africa. In the Cape Colony, where for many years the native has enjoyed the franchise conferred by the British—to beat the Dutch, it is alleged, but in any case conferred—one finds the Black tribes multiplying amazingly. It is important to note that of all the Black races known to the country since the time of the first White settlement, only one, the aboriginal Bushman, now living in small numbers on the edge of the Kalahari Desert, has decayed. Local decadence of natives in the vicinity of industrial centers is negligible.

The Africander is not in the slightest degree appalled, however, by the challenge of numbers. The non-expansion of the White race in South Africa, and the economic conditions which have hampered that expansion, are of graver concern to him at this time. There is much more in the new Nationalist administration's purpose to have more White labor employed at the mines than a desire to bolster their present Labor allies by adding to the White population likely to vote Labor. Nationalism has freely declared that South Africa has been the loser by the fact that its principal industries have been in the hands of people at a distance who care nothing for the welfare of the country as a whole as long as there is an abundance of cheap labor for the mines and dividends are assured. That cheap labor is Black labor. When, at the close of the Boer War, the native had so much cash in hand for services with the British army, and there was a falling-off in offerings of Black labor for the mines, Chinese were introduced for a time. For many years there have been flowing into native hands large sums of money annually for work at the mines. The native is not a spender. He can go back to his kraal after his term at the mines and rest for months on end, without disposing of the major portion of his savings. Native money has been steadily edging ahead in the acquisition of farms, of land, of property in other forms; and native demand for the recognition which goes with the possession of property is growing. This cheap labor is in abundance. Not only at the mines but in every activity it is presented in increasing volume as the teeming reserves spill over. There is practically no place for White unskilled labor, and for a long time there was no offering of White unskilled labor to speak of. Conditions have changed. Surplus White population from the farms has to a large extent spread itself over the newer territories. The country Africander, Dutch or British Colonial, is a man of the open country. He has found grazing lands and farming country after his own heart in the Rhodesias and in Southwest Africa; but the surplus of the farm population which was unequipped with capital has drifted to the towns, added itself to the growth of the White industrial classes there, and heaped upon the South African government its most embarrassing problem—for there has not been industrial expansion sufficient to absorb those elements in the field of skilled employment. And if their dislike to competing with the native in the unskilled field be successfully met, they are excluded by the cheapness of the Black labor when cheapness is the determining consideration.

Such are the economic conditions obtaining at the present stage of the development of South Africa, and hampering expansion of White population. Much industrial expansion is in prospect, and the Nationalists claim that it should have been farther ahead but for the lack of vital interest in the country of those controlling its great industries. The charge to that alleged interest in dividends only the fact that while the increasing native millions have steadily waxed wealthy under the conditions accepted as suitable by the mine-owners, the White population has developed a class for which the country holds no opening, and for which there is nothing but the bondage of a distressing poverty, or departure.

Not only is it the Nationalist contention that the acceptance of conditions which were satisfactory to the Africanders-by-dividends because they made certain a supply of cheap Black labor for the mines is responsible for the lack of balanced development now imperiling the very existence of White civilization in South Africa. There is frank admission that it is the misfortune of South Africa that she is faced with inability to make proper provision for the maintenance of White population *and the encouragement of its expansion*, at a time when the strength and resources of the native millions are feeling the sweep of new impulses under an unceas-

High Cost of Watching Other People Play

Over a Billion Dollars Spent to Watch the Season's Epoch-Making Contests

By PAUL MACDONALD

THE United States spends more on sport each year than all the other countries of the world combined. Americans spend little more than any of the other leading nations of the world to *play*—that is, to *play themselves* (not so much, at least, as the British Empire), but we spend millions and millions and millions of dollars *to watch others play*. The gross amount reaches well over the *billion dollar mark*.

Our national preference to watch paid experts perform in various athletic lines marks us a nation of sport enthusiasts rather than participants. To watch the skilled performances of others is more pleasant to us than to engage in competition ourselves, but we pay a staggering price for this preference.

On December 31 will close the most successful sports year in the history of the United States. In 1924, the United States attained to world supremacy in sport. Among our victories at the Olympic Games were those of the track and field events, tennis, swimming, trap shooting, and rowing. We retained the Davis Cup, symbolic of world supremacy in tennis, defending this trophy with the loss of but one set, a feat that had been accomplished but three times previously in the history of international tennis competition. We retained international supremacy in polo and led the world in golf. Three international match events in thoroughbred racing returned American horses winners over Epinard, fleetest equine of Europe. American boxers successfully defended their championships against invading challengers. In brief, the United States came near gaining world supremacy in all the major and minor sports. It was the most successful year any nation has ever experienced in sports.

When the Prince Saw Polo

THERE was a great deal to see in sports in this country during 1924 and since there was more to see and more people than ever before were anxious to watch, the expenditure of money reached an amount that no one can accurately tabulate. There has been nothing similar in the history of the world.

Those who discuss the high cost of sport usually point to a world series that lasted seven days and showed gate receipts totaling more than a million dollars, to an international polo match of two games that cost more than a million, and to football games where the receipts were more than $200,000. But, these events are but a drop in the bucket. They become insignificant in the face of total expenditure.

The polo matches on the Hempstead Plains where stands the Meadow Brook Club at Westbury, Long Island, cost more than $500,000. From a social standpoint it was the most brilliant sports event of the year. Among the spectators was the Prince of Wales and several society leaders of the British Empire. Society in this country was either there in person or represented. The gate receipts came near the half-million mark. The amount spent to play the two games and the amount spent to see them was about $1,000,000.

But several more million were spent that do not enter into the chief figures. Thousands traveled long distances to attend the matches. A fortune was spent in ocean passages and railway fares. But the greatest expense came in wardrobe. Designers and dressmakers were busy for weeks preparing costumes for the polo matches. No one is able to say how much money was spent on dress for these matches but the sum will reach into millions. As a matter of fact the expense of staging the international matches between Great Britain and the United States is so great that the men who rule polo in this country and on the other side decided that challenge matches would hereafter be played only every three years.

Polo, known to few persons, comparatively speaking, costs many millions each year. Polo has made rapid headway. It is played extensively on the East and West coasts, in the Middle West and in the extreme South in the winter season. It is still a class sport and threatens to continue so. It costs too much money ever to become popular. Expensiveness will insure its exclusiveness. Only the wealthy can indulge in it. Polo teams need ponies and good polo ponies cost "good" money. The Prince of Wales, who brought a string of ponies to this country, sold them at auction after the international matches ended. Two of these ponies brought $10,000 each. A ball player may have two dozen bats but he will use only one or two out of the lot. A polo player may have a few dozen ponies (and most of them have that many) but his preference will rest with three or four.

In a large Mid-Western city a wealthy manufacturer became a polo enthusiast a few years ago and organized a team. He was the financial backer. He bought a large tract of land, built stables, laid out three polo fields, stands, and so forth, and finally gathered a string of seventy-six ponies. In its second year this one team showed an investment of approximately $500,000. Among the seventy-six ponies the chief backer would ride only four; he did not care for the others, although he bought pony after pony.

A stupendous sum of money is invested in polo in this country. There is no chance to get back this money unless a sudden trend makes the real estate desirable and valuable for residence lots. Crowds at polo matches are usually small. The amount of money realized in receipts each year by any team (with the exception of the International Four) is hardly enough to buy one crack polo pony. Among the chief items of expense is that of wardrobe (even at club matches), traveling expenses and the social functions which usually follow the games.

Turn to the world series of more recent date. The official figures of Commissioner K. M. Landis show that more than $1,000,000 was taken in at the gates of the Washington and New York ball parks for the seven games. Mr. Landis' figures represent the face value of tickets but the people that saw the games in Washington (where four of them were played) paid more than the indicated sum. The day before the series opened in Washington *tickets were selling at two and three times their face value*. Never in the history of baseball have scalpers reaped such a harvest.

The gate receipts represented but part of the money spent to see the world series. Many who attended came from afar. Some foreign countries and every state in the Union were represented. A fortune was spent in railroad fare. Automobile travel added a staggering sum. Hotel bills formed a large item.

But, considering baseball as a whole, the amount spent on a world series is but a small fraction of the money spent on the sport. There are sixteen major league teams and while attendance figures are not given out for publication, you can estimate what the owners of these sixteen major league teams received during the recent season by considering what one team is known to have done. The Detroit club, finishing third in the American League, played to more than 1,000,000 persons on its home park alone. One-half the games, of course, were played away from home. The average attendance of every game the team played in Detroit was about 14,000. On this basis an estimate of 16,000,000 as an attendance figure is very conservative.

Besides the sixteen major league teams there are innumerable other leagues in organized baseball. These carry various classifications but that has nothing to do with attendance. Nearly every recognized league in the land made good profits in 1924. It was a big season even for the minors.

Besides the recognized minor leagues there are a few leagues known as "outlaws." Organized baseball will not deal with them. But they draw crowds just the same.

Next comes a group of leagues that play games two and three times a week. Then there are the twilight leagues, made possible by daylight savings time. These leagues are equipped with good playing material. Many of them have star college players and others have men that jumped from organized baseball. Games start at six o'clock and in many sections the "twilighters" outdraw the organized team playing in the afternoon.

To this group of organizations must be added the semi-pro groups. They play on Saturdays, Sundays, and holidays. Admission is charged to their games. Most of them have big followings and rivalry is often more intense between these organizations than in the organized baseball sections.

The secret of the millions upon millions of dollars spent on viewing ball games in this country rests in the income tax office and it would take a corps of Federal experts quite some time to figure it all out. And then the total would not be correct, for in many instances the baseball receipts do not appear definitely as such but become part of general sums.

On the other side of the gate is the terrific cost of upkeep. Think of what it costs to send these teams around the country! Railroad fares and hotel bills mount into fortunes each year. Anyone would be independently wealthy as would his children and grandchildren, if he had the money the teams of either major league spend annually on railroad fares and hotel bills. Add to this the sum spent by the many minors and semi-pros.

Stadiums Are Springing Up

THE property owned by ball clubs in the United States is worth more than entire towns, and towns of considerable size at that. To draw well the ball park must be conveniently located, as near as possible to the center of the city. Real estate so situated in the large cities that support major league teams is worth a great deal of money. Try to estimate the land value of the two parks in New York City and the one in Brooklyn, the two in Philadelphia, two in Chicago, two in Boston and two in St. Louis. Then there are Cleveland, Cincinnati, Washington, Pittsburgh, and Detroit. The last-named city has its ball park less than a mile from the city hall. These parks cover more than 16 city blocks of choice real estate. And on nearly all of them now rest stadiums that cost from $500,000 up.

The next three leagues are the International, the American Association and the Pacific Coast. Right behind them, in popular rating, comes the Southern Association. These four leagues have thirty-two clubs representing cities from coast to coast and border to border. There are huge fortunes tied up in real estate in these leagues. The thirty-two parks represent mammoth real estate holdings. Then come the Western League, Texas League and Eastern League. After them a long list of other leagues, graded down according to their importance. They all own land buildings.

The cost of keeping up these plants is enormous. The New York Giants of the National League must take in $550,000 at the gate before they can begin to make profits in any season. Their annual expenses are $550,000. The cost of putting the New York Yankees on the field is about the same. Other major league teams are not under the same terrific expense but none of them has expenses less than $250,000 a season. Most of them spend nearer half a million dollars than a quarter million.

With this upkeep, it is evident that the gate receipts must be enormous to enable the club owners to make large profits. It becomes apparent that the public pays millions of dollars to see baseball played in this country.

America's next largest investment in sports comes in football. It is only in comparatively recent times that football has been a powerful magnet.

There are more than 300 college and university football teams. More than 300 played this year. To see them play the public paid many millions.

No ball game was ever played before a crowd as large as that which saw Michigan and Illinois battle in the new stadium at Urbana, Illinois, in October. Nor did as many people ever see a single ball game as attended the Iowa-Illinois game in November. The gate receipts at football games mount away over those at ball games, except at a world series. The top price for box seats at nearly all major ball parks is $1.25. The price of seats at football games is twice that much, with extra prices for box seats where they are available.

None of the major educational institutions would think of building a stadium now with a seating capacity of less than 60,000. The mammoth structures completed this year and those contemplated for the near future, all seat more than 60,000, and architectural plans are so drawn that additional seats may be built to bring the capacity of the stadium above the 100,000 mark if conditions demand such an increase in future years.

Stadiums are arising in the East, Middle West, Far West and South. The construction is in response to public demand. Most of the new stadiums cost around $1,000,000. Some that will be built in the next five years will cost considerably more.

The money spent in building stadiums is little when compared to the money spent by those that fill them. Here the cost mounts higher than in any other sport. To begin with, few colleges or universities are adjacent to large cities. Most of our leading institutions are lodged next to villages.

Football Enthusiasm Growing

THE most stupendous stadium dedicated this year belongs to the University of Illinois, located at Urbana, and Urbana has Champaign as a twin village. The populations of Urbana and Champaign are exceedingly small and Chicago is the nearest city of consequence. But Illinois managed to get more than 70,000 persons into her stadium on a few occasions this autumn. On the day of the game dozens of special trains rolled into Champaign and Urbana bringing crowds from various distant points in the Middle West. The price of admission produced total gate receipts running well over $100,000 at each of these games, but this was small in comparison with the sums spent by multitudes to reach the stadium. Again the national cost of sport must take account of large traveling expenses.

In football the enthusiast will go on long journeys to see his favorite team play. There is not the same condition in baseball. No matter where you live in the United States there is a league team in some town or city fairly close by and the long railroad journey is not necessary. Only in a world series does the long jaunt take place. But football has a personal attachment that baseball can never claim. The man who graduated from a college will follow that college in football and he will travel hundreds of miles to see the varsity eleven of his alma mater perform in an important game. He has a personal interest in the team. He is still part of the college and he will always be part of it and so is the team. It is one for all and all for one. So each autumn thousands and thousands of men journey thousands and thousands of miles back to the old campus to the familiar scenes of college days. Once more they sit up in the stands and follow the swing of the cheer leaders, sing the old songs, yell the old yells, implore the eleven men on the field to "fight 'em varsity" or "hold 'em varsity," whatever the exact situation on the field may demand. The expense cuts quite deep into the bank accounts of the old grads but they do not mind it. They hear the quavering voice of conscience but they silence that. They call this another vacation and they feel they simply had to have the vacation. A bit of an expense, true, but one must pay for health.

All over this land are varsity teams that play two months each year to millions of spectators. And for the millions that see these games there are millions more who raise bitter complaint because they are unable to see them. The supply of seats is unequal to the demand at every big game. A university that can take care of but 50,000 spectators and finds the demand for seats exceeding 100,000 (as frequently happens) is assailed from all sides by those that were unable to buy. That is why so many universities are praying and paying for stadiums that seat 100,000 or more. Whatever the total attendance at football games this year happened to be, it could have been at least 30 per cent larger had all those who asked for seats received them and had there been a chance to care for those that did not ask because they decided it was of no use.

The vast sums taken in at football games enable college sports to continue on a large scale. At nearly all the colleges and universities it is football that makes the athletic wheel go round. The money taken in at the gate is used to defray the expenses of other sports. Nearly all college ball teams are a heavy loss to the institutions they represent. Track and field athletics are another financial burden on the colleges, or would be, except for the money taken in at football games. For some reason the public does not care for track and field games. Only a few persons attend national and intercollegiate meets. The public simply does not take to them. But as track and field sports are among the most beneficial that can be indulged in it is wise to

(Concluded on page 14)

Mr. Ford's Page

SPEAKING of taxes again, there is truth in the saying that life in the United States is worth whatever it may cost, worth twice or three times the tax cost of living in any other country, and yet to rest the matter there is to violate a fundamental American principle and form an alliance with national wastefulness. The quality of our American life can never become too high, but its cost in taxes may easily become so.

Taxes have risen higher and higher, the tone of protest keeping pace, and spasmodic efforts at reduction have been made, but it is a question whether the people are any nearer an understanding of the tax problem than they ever were. Yet the power to tax, being a power granted by the people, a power which originally and fundamentally is their own, some effort ought to be made by them to understand this power, why they delegated it, how it is used, and how its use can be controlled.

What are taxes supposed to represent? The cost of governing us. What does "governing us" mean? The maintenance of legislatures for the making of laws which are supposed to render life more harmoniously livable; the setting up of courts to restore the equilibrium of justice wherever it has been broken; the organization and upkeep of the national defense; the support of national internal services like the post office; in brief, federally speaking, to administer the public affairs common to all the states.

This is about all that our government duties have ever consisted in. They have not greatly changed during the last 75 years. That is to say, people who lived 75 years ago got just about as much legislation, protection and service as we do today who pay more. And where we get more it is not that which has caused the rise in taxes.

Once upon a time the work of governing was the sole business of government, but nowadays the mere business of being a government is a bigger business than governing is. With no production at all, with only overhead, government has become itself an enormous charge upon the people. That is, considered in its merely ornamental and not in its useful aspects. The cost of maintaining it at a standstill would be so great, that some day a critic may arise to say that the difference between overhead and production cost measures the real worth of the government to the people.

And yet, making allowance for the average lack of managerial ability in political positions, it would probably be possible to make out a fairly good case for the situation as it is. For one of the causes of high taxation is the persistent zeal with which our people have been inoculated with the doctrine of "let the government do it."

It all comes back to the people at last. They ought to know what is going on, and they don't know. What is more they don't want to be told, unless there is some tag of political sensation attached to it. They push the business of government as far from them as possible, and only recognize its existence when the cost begins to pinch.

This pushing back movement has been going on a long time. Cities have been saying, Let the county do it. Counties have been saying, Let the state do it. States have been saying, Let the national government do it. All classes of people, seeking special privilege, have echoed the cry, Let the Government do it! And as a result there has grown up in this country a professional class that is only too ready to foster these cries, for it means centralization, it means bureaus, it means colossal faddism, it means jobs galore, and it means no responsibility.

It should be said, however, that these remarks do not apply to the constructive activities under government auspices. It would be pleasant to say that these activities are undertaken by the government itself, but they are not; they are carried by men who are not in any sense politicians and who are thinking of the scientific welfare of the nation, and not at all of personal or partisan preference. We refer to the scientific men in the employ of government departments, who are dealing with the fundamental problems which eventually have more effect than laws can have upon the public life. These men are underpaid in almost every instance. Their niggardly appropriations are often the first ones to be cut down by men who do not understand their importance. This work could be extended and all necessary funds supplied it, without it being so much as a drop in the pond of federal tax expenditures.

But in other departments the same defense of usefulness cannot be made. The government has been induced by lobbyists to enter upon sentimental (miscalled humanitarian) enterprises which never get any farther than the installation of officeholders at Washington. It is now quite a recognized custom to have the government itself support the army of propagandists at the capitol by providing them with their own bureaus, jobs which pay expenses. The art of making insignificant minorities appear like imposing and threatening majorities has been developed to perfection at Washington, and eventually ways are found to make Mr. John Citizen foot the bill, for the results.

Once in this country the question of States' Rights came up for debate; one phase of it, concerning the right of a State to secede from the Union, brought about a war. It cannot be said that the question was ever decided, but it was eliminated. We are approaching in this country a period when the question of States' Rights is coming to attention again, accompanied this time by the question of States' Duties. There are no rights without duties—a truth so old that it has rounded the circle and become new again. And one of the duties of the States is to take care of its own affairs and not depend upon the Federal Government for everything.

Of course, there are interstate concerns which overlap States' interests and become national, but interstate elements have been worked to the limit. No doubt every baby born has its interstate aspects in that it is unlikely never to cross a state line in its lifetime, and yet the State can look after its babies better than Washington can. But Washington has been left to do it—at least left to set up the offices and lay the taxes incident to doing it. It is so with other things: two amendments are up now, one to nationalize the school, the other to nationalize the child—both of them tremendously important steps in "letting Washington do it," and correspondingly costly to the very States who are asked to give up control.

The nation is due to learn that our progress is not to be continuously on one line, but that the checks and alternatives of American political thought are just as important a national possession as the main affirmations. Federalism is our main line, but it is not complete, indeed it may become dangerous, unless checked by States' Rights. Both the Republican and Democratic theories of government are needed, and both have their times to be operative. It is not beyond possibility that it may fall to a Republican administration to recognize the pertinence of adopting Democratic theory in certain cases. When Federalism is being rolled into a mountain bigger than the people, it clearly becomes a duty to maintain the national balance by harking back to good States' Rights doctrine. Both doctrines are American, and we cannot get along without either of them.

This reduction of the practice of passing all our duties on to Washington will compel us to count the cost at home, and this in turn will have a very noticeable effect on tax charges.

THE cost of our Federal government will continue to be high as long as we make it a catch-all for every fad and for all the duties which other political units evade. When cities and counties shove their duties over to the State, and when the States shove their duties over to Washington, there results a lack of interested management and a corresponding increase in tax costs which is harmful. It is worth a great deal to live in the United States, but that is no reason why it should cost as much as it is worth. Everything of value ought to be worth more than it costs, and even national life would lose its value if the cost were made to equal its worth. Taxes thus far in our national experience have been a matter of adroitness on the part of government and of complaint on the part of citizens. Taxes should now become a theme of careful study.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

On What Meat Have These Caesars Fed?

THE report that independent and insurgent Senators were to be "read out of the Republican party," made an impression of queerness on the public mind. There was even an element of amusement in it. An element of serious concern, too—for is this all that the Republican party has learned from the elections? By what right does anyone interpret the election of Mr. Coolidge as a mandate to suppress the spirit of self-criticism so essential to the balance and efficiency of a party in power?

It may be inaccurate to lay this action to the "Republican party," since the party has not been consulted about it. Republican officeholders at Washington do not constitute the Republican party. Republican Senators do not constitute the Sanhedrin of the Republican party. In fact, the Republican party as represented by the Washington officeholders was discredited and beaten and would now have been facing a woeful Fourth of March had not the personality of Calvin Coolidge commanded the suffrage of the people. Wherefore, then, do these officeholders, who owe their presence in Washington to Republican votes, take it upon themselves to oust from party counsels men just as honest and earnest as themselves who owe their presence at Washington to an equally impressive mandate of Republican votes?

To say that Senator La Follette and Senator Ladd shall have no voice in the counsels of the party is equal to saying that the people of Wisconsin and North Dakota are ousted from the Republican majority of the United States. It simply cannot be done, and only men blinded to the import of the times would think of attempting it. We mention Senators La Follette and Ladd especially because these are personalities of such eminent respectability and their work has been of such a character, that a protest is roused in their behalf in the very citadel of American fair-mindedness. When their own constituents repudiate these Senators, it will be time for party councils to consider action. Until then they are Senators of the United States and representatives of great commonwealths. And they are more than that: they are representatives of certain tendencies in American political thought to which the Republican party will have to give serious heed during the next four years, or find itself in a more critical situation than it was this year. Admittedly there are blowhards among the Senators called "progressive," there are shallow-pated notoriety seekers who are "insurgents" simply because they have neither the ability nor the experience to be "regular," but neither Ladd nor La Follette fits these descriptions. They are men of experience and attainments, and their presence in the Senate has been useful to the nation. True, the nation rejected La Follette for the Presidency, and will continue to do so, but it also rejected Taft and Hughes. It is not every man who should be President. But Taft and Hughes have found places of usefulness in the public service, and so has Mr. La Follette. To attempt to read him out of the Republican party is to exhibit a degree of partisan swell-headedness possible only to the most egregious political pompousness. It will give the ultra-radicals, who fastened on the candidacy of La Follette for their own ends, a new battle cry. It will accentuate the tendency toward hidebound superiority in Republican party councils. Above all it will notify the country that the Old Guard of Republicanism interpret the elections as a private grant of power, and it is certainly anything but that. Had the voting public believed that such an interpretation would be made of their action, the result would have been different. Anyone who can derive a justification of high-handedness from the last election is by that fact judged as politically incompetent.

In the last analysis it is not the fate of the excommunicated Senators that matters. If the taboo stands they will doubtless find many compensations in the reaction which will follow throughout the country. The regrettable element is that the party in power should exhibit such petulant narrowness, such childish resentment of healthy criticism, such dwarfed views of party dignity.

The way to purge a party of insurgency is to make the party so big and clean and progressive that forward-looking men will not have to go outside to find a place to work. The Republican party will die earlier from the dry rot of the Old Guard, than it will from the political aliveness of men who believe that the first duty of any party is to serve the people as a whole.

It would require a lot of testimony to make the people believe that President Coolidge is in sympathy with this ouster movement.

Lawyer's Sophistry

ARGUING for the Child Labor Amendment, Manley O. Hudson, Bemis Professor of International Law at Harvard, contributes to the *American Child* some comparisons of the United States Constitution as first adopted with the change proposed in this addition to the powers of Congress.

The *American Child* is the medium for distribution of the propaganda of the National Child Labor Committee. Its one-sided report on child labor in the sugar beet fields of Michigan was thoroughly exposed some three years ago by a legislative committee of the state. The real situation was ignored to prove that child life was generally placed in circumstances peculiarly detrimental. Its case was not supported by the facts.

Professor Hudson asserts that Article I of the Constitution delegates to Congress certain powers and that the powers to regulate the employment of children is but an extension of those rights. These positions are readily admitted. But he forgets to say that the Constitution was deemed faulty by its makers, and that they proposed certain amendments for the purpose of removing any doubt as to powers not delegated, and to clear away ambiguities disputed by the advocates of the Federal and Democratic theories of government.

Among the ten amendments approved by the states, termed by the proponents the "people's bill of rights," was one in which it is declared that all powers not expressly conferred on Congress are reserved to the states.

Professor Hudson states that by the arbitrament of Civil War the question of the supremacy of the Federal Government was established. No one will dispute the definite settlement of the right of a state to withdraw from the Union, but there remains the fact that powers delegated to Congress are not to be exercised by the state, and that powers reserved to the state may be vested in Congress only by amendment to the Constitution. Here is where sophistry leads the Professor to a mistaken statement:

"States already have the power . . . . 'to limit, regulate, control and prohibit' the labor of persons under twenty-one years of age . . . . To the extent that Congress does not act, the states would retain that power."

The truth of this proposition is not admitted. *The only way for the state to retain the power which is among those reserved to it, is not to confer it on Congress.*

The Constitution itself was approved by popular vote in each of the subscribing colonies. The "bulwark of American freedom" would have had greater protection from unwise amendment, had the power to amend been left to a popular verdict. From the beginning there has been a constant effort to reduce the powers of the state and transfer them to the Federal Government; to take them as far from the people as possible.

There is the essential difference. It is the eternal principle of self-rule that is involved.

Encroachment upon this fundamental principle has reached such a pass in this nation that the pendulum is swinging back toward state's rights. At least toward the principle that future amendments to the Constitution must enlarge and not restrict the liberties of the people. The question in this amendment is not Child Labor—there is horrible child labor in Russia whence this amendment sprang: the question is whether the fundamentals of Americanism are to be tampered with whenever a group of socialistic women at Washington can be led to demand it.

Traffic Problems in Cities

THE problem of traffic congestion is not merely the number of motor cars in operation, but also their routing and speed. The number of cars will increase as long as cars prove useful, and the vigorous tackling of the routing problem is now well in hand in most cities. It is just beginning to be understood, however, that speed also is an element in congestion. The problems presented by a 15-mile-an-hour speed limit are made much simpler when the permissive limit is stretched to 25 miles an hour. This can be understood by making a simple computation or comparison. Suppose we were back in the old horse and buggy days and that there were as many horse-drawn vehicles in our cities as there are now motor cars; our cities would simply be packed with horses and buggies, unable to move. The greater speed of the motor car enables the quicker shifting of congestion and its spread over a wider area. Just as the greater speed of the car eliminates the problems that would arise out of the same number of horse-drawn vehicles, so the increased speed of cars over the present rate will eliminate many problems now pressing for solution.

Detroit has found that its 15-mile-an-hour speed limit fosters congestion. "We found that 15 miles an hour was too slow, that traffic became congested at that speed," says a Detroit traffic official. "We raised the limit to 20, and that is fast enough." It is obvious that when congestion follows upon the 20-mile-an-hour limit, the remedy will be greater speed. As a matter of fact, 20 miles may be the official limit in Detroit, but the actual driving practice, except in downtown districts, is higher. In most cities a driver who should run only 20 miles an hour would find himself obstructing traffic. In some cities slow driving is an offense, like fast driving.

The whole question will work itself out in practice. We are still in the period when there exists a prejudice against brisk driving in the belief that it is reckless, dangerous. Brisk driving is not necessarily reckless or dangerous. Slow driving may be both. Brisk driving has probably prevented more accidents than it has caused. Safety is not a matter of speed, but of control, and control is a matter of the motorist and his brakes. In city driving the ability to stop is as important as the brisk pick-up. The prejudice against speed will gradually disappear with increasing driving experience and under the pressure of traffic necessity. But the prejudice in favor of control will increase until it is generally obtained.

Jusserand

JULES JUSSERAND, ambassador of the French to the United States, returns after 22 years of American service to be the unofficial ambassador of the people of the United States to the French people. Just as all true business practice is equally beneficial to the buyer and seller, so true diplomacy serves the people who send the diplomat as well as the people to whom he is sent. James Bryce was of greater service in interpreting the people of America to the people of Great Britain than in any other work he undertook, and the people of Great Britain profited more through the knowledge he brought them concerning us, than they did in any other way.

This is not a parochial Americanism. It is based on the fact that it is the new and not the old that is in need of interpretation. America is a comparatively new fact in the political world. We have here a new people, a new attitude toward life, a new vigor in tackling age-old problems. Our newness has been a barrier against our being wholly understood in Europe. Millions of immigrants to our shores have helped interpret us in letter and return visits to their homelands; and the governments have usually shown wisdom in sending ambassadors who were competent for the interpretive task. Perhaps Germany is the only government that signally failed in this enterprise, for it is now generally admitted that American psychology remained an impenetrable mystery to Potsdam. Having all Europe behind them as their past, Americans have found it easier to understand European tendencies than Europe has found it to understand American tendencies. Men like Bryce and Jusserand have been bridges between the old and the new, and the great value of their services has been in making the new intelligible to the old.

We may confidently look forward to many years of ambassadorial service in this sense from M. Jules Jusserand. He has commended himself to the American people by his character and ability, and in return our highest representatives have been proud to call him their friend.

A "Live Town" in the Sun-Scorched Orient

Aleppo in Syria Has Broad, Clean Streets, Good Hotels, and Policemen in Khaki

By HAL WALKER

HEAT is a comparative term anyway, but we struck the superlative in the train trip from Homs to Aleppo in the hours we were passing through a country particularly desolate. There was hardly a breath of air stirring, and the sun beat down pitilessly, making the temperature inside the cars 104 degrees. Luckily for us we had a special train and so made better time than the regular schedule maintained. The Damascus and Aleppo line was part of the ex-Kaiser's dream for rail communication between Berlin and Bagdad until his plans for world dominion were frustrated with the aid of certain Yankee fighting men in the late unpleasantness.

There was nothing to see or to do on the way to one of the most interesting cities in all Syria. The main effort was to keep as cool as possible, and this was impossible, even with the aid of a baggage car filled with cooling liquids which were passed to us at every stop and many times between. Outside there was nothing except desert, with here and there a huddle of huts which looked like gigantic beehives or the winter homes of Eskimos. There appeared to be only one opening in these queer houses, the door. Although it seemed improbable, we were told that the houses were built with these domed roofs so the snow would slide off in the winter, but the idea of winter when the temperature that day was breaking all records seemed ludicrous.

At various stations at long intervals along the line, for we were not making Twentieth Century Limited time by any means, there would appear a French officer with one or two men posted in this desolation and heat. I imagine a short tour in such a place would be enough to make the most hardened campaigner long for the gaiety of Beyrouth, to say nothing of Paris and its boulevards. After several hours of this sort of scenery all at once there was a waft of coolness in the air and ahead we saw the domes and minarets of Aleppo.

Street musicians, Aleppo.

Aleppo, the market place.

From the citadel entrance, Aleppo.

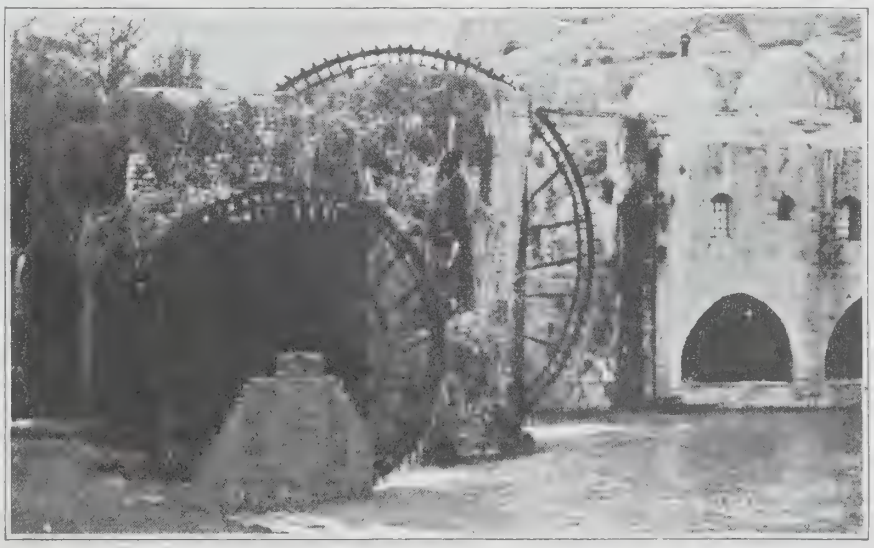
Soon we were riding past green fields and fruit trees growing sturdily by means of the life-giving water with which their roots were irrigated, and after only a few minutes of this we drew into the station at Aleppo, which is a rather pretentious affair. No motors this time; instead, we were assigned, two by two, to carriages which we were to have during our stay, each with a smart driver in khaki and a policeman, also in khaki, both wearing the big astrachan headgear which savors more of the Russian steppes than the torrid heat of Syria.

Aleppo is what we Americans call a "live town" in spite of its antiquity. It has broad, clean streets, and good hotels much better than those in Damascus. Aleppo is 70 miles from the Mediterranean and is on the caravan trade routes to Bagdad, Mosul, Kurdistan and Armenia. It has four Catholic archbishops, Greek and Armenian prelates, and the Christians number one-sixth the population. The Kuweik River forms the basis for its irrigation and agriculture, while spring water is brought eight miles through an ancient aqueduct to the city. The population is less than 200,000, a large number of inhabitants leaving the city at the time of the earthquake in 1822, at which time the population was considerably greater.

The historical point of interest in Aleppo is its citadel which rises 200 feet above the town, massive ramparts surrounded by a moat, the walls of the citadel rising fifty or more feet from the top of the moat. It is told that this citadel hill is not a natural but an artificial hill, and that it was created by tens of thousands of war captives toiling for years. According to this historical information, the citadel is built on many thousands of rock pillars which were hewn and put into place by these slaves. The Turks never challenged the legend, but the French plan to make excavations and ascertain the truth.

In front of the citadel entrance, which is falling into decay, is a large sun-baked square, and here part of our official program consisted in an entertainment furnished by native swordsmen and dancers. The fencing was more exciting than similar exhibitions by Japanese experts in their national accomplishment, because these brown men in Syria had no protection from the naked blades, and agility alone saved them from decapitation. There was a camel dance by a native woman richly clad, but with veiled features, and loaded down with bracelets and bangles. It couldn't really be termed a dance because she knelt on the camel's back and her dancing was with the arms and upper part of the body. Even this was brought to sudden stops frequently because the camel disagreed and sank to his knees, only to be prodded to his feet again with much bubbling of protest on his part.

Second only to Damascus was the program of entertainment and sight-seeing during our stay in Aleppo. There were elaborate lunches and banquets, here for the first time entertainers being used. The inside of a cheap wooden building, used ordinarily as a café and dance hall, was transformed with the richest of rugs as hangings into something magnificent, and we dined here as the guests of Aleppo officials in true French style. However, as there was no kitchen attached to this banquet hall our dishes were brought from a hotel kitchen a hundred yards down the street and were not piping hot when they reached the table.



These wheels are usually in pairs, one large and one small, at Hamah.

The scribes in the party were more lucky at Aleppo than anywhere else on the trip due to those private carriages which we had. At other places we made the various inspections in our regular motors with the drivers under command to follow the prescribed route, while at Aleppo after we had seen enough schools and industrial plants we would steal away to the souks to purchase trinkets or wander just "window shopping," if the term can be used where there are no windows. I rate the souks of Aleppo even more interesting than those of either Damascus or Constantinople because of the more varied gathering of peoples. All the tribes of Farther Asia are represented among the shopkeepers and I saw the first Hindu silversmiths here that I found in the entire country.

Then another thing which made Aleppo more fascinating was that "Joe" was with us again. Joe was his real name but his last one had about five syllables and although he wrote it down for me I could never remember it. He was one of those children of fate so often found in the Orient, but do not think he was a child, for he weighed about 200 pounds, was 35 years old and the head of a family of a wife and four children. Joe was a perfect guide and had been attached to our mission since landing at Beyrouth but as he had been responsible for the baggage which was carried ahead or behind us on motor trucks we had not seen much of him.

He was Syrian born but taken to America when he was three years old and brought up in that center of culture, Boston, where he went through the lower schools and graduated from Boston Latin. About the time he reached his majority his thoughts turned on marriage and he decided to go to the land of his birth to seek a wife. Landed in Syria, with his native shrewdness and later Yankee training, he decided conditions were more favorable for his success and so he stayed to rustle the East. During the early years of the war Joe was a contractor supplying Turkish troops with wood for fuel. He had a bill against the Sultan's representative for 3,700 Turkish pounds, which is no mean sum in American dollars, had it O.K'd and was told to come back the next day for payment.

Unhappily for Joe, the British troops were stationed there next day and his Turkish paymaster had fled. Then he was attached to the British intelligence section as long as they were in the country and joined with the French when they took over from the British. He devoted himself to me as he had not had an opportunity of speaking English for many months, and no commission was too large or too small for him to carry through in record time. He knew the best jewelers, silk dealers or those of any other craft and would drive a sharp bargain with them. I suppose he later claimed his commission, but that was his affair.

I thought nothing could be hotter than the train trip from Homs to Aleppo, but I found I had miscalculated, for the trip from Aleppo to Hamah was doubly uncomfortable. The heat was not more intense, perhaps, but a sirocco was blowing, filling the air with fine sand and dust and making the heat of an oven preferable in comparison. I have experienced siroccos in Algeria when the air seemed to scorch the lungs, but never anything quite as bad as this heat on the way to Hamah.

After hours of discomfort we seemed to have reached Paradise when green was seen in the distance and huge water wheels slowly revolved raising buckets of water from the river Orontes. The sight of the dripping wetness drove away all the discomfort we had undergone. For half an hour we sped along through an oasis with these giant wheels either near at hand or in the distance, and then we were in Hamah itself, the "Hamath" of the Scriptures. Hamah isn't a metropolis; it lies 110 miles northeast of Damascus, but it has changed little through the ages, and is one of the best examples of ancient civilization—there is not even a hotel in the place and we stayed in a small theater into which beds had been moved for our accommodation.

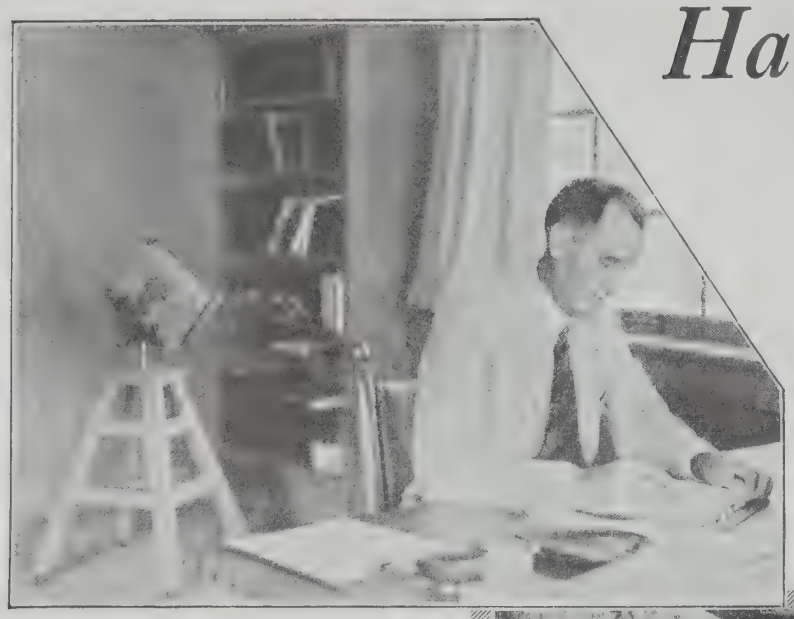
Hamah is also known as "the city of one hundred aqueducts" and we never tired of watching those huge wooden wheels moving slowly in the current, never changing speed, seeming to be as immutable as time itself as they carried the water from the river bed to the orchards and gardens many feet above, the wheels themselves being from sixty to ninety feet high. They are called "sakiehs" in Arabic, and they go on forever, day and night, each with a different tone as it revolves so that together they make a sort of harmony. Under a clear sky in the stillness of the night the splash of water from these wheels into the irrigation ditches, the murmur of the water as it flows along, the sound of the river itself,

(Concluded on page 14)

Harold Bell Wright, Novelist

"The Dickens of Rural Delivery Routes" At Home and at Work on the Desert

By JOHN ANSON FORD



Harold Bell Wright at his desk in his study. All of the furniture was designed by him.

The living room in the Wright home, looking into the dining room.

I HAVE just returned from a pilgrimage of considerably more than a thousand miles of motor travel over mountain ranges, across deserts and through thriving towns and cities, many of which did not exist, even in name, 25 years ago. I have been to see Harold Bell Wright in Tucson, Arizona, and the strange, fascinating home which he has built, consciously or unconsciously interpreting his own outlook on life.

Our journey was a fitting introduction to this man whose novels have been sold to the number of millions of copies and whose name stands practically at the top of the list of popular American writers. Our route took us through that romantic reclaimed region, the Imperial Valley in Southern California, which has been made known to countless thousands through "The Winning of Barbara Worth." Ascending from this valley, whose cotton and alfalfa fields show no trace of the desert that was, we traveled for mile upon mile via creaking plank road, over smooth, undulating sand dunes. Followed Yuma and its evidences of Indian life on every hand, the suhuaro-sentineled desert of Arizona, Phoenix and its floor-level Salt River empire of irrigated green. Finally after another 100 miles of bristling cholla, slender-armed ocatilla, and solemn suhuaro we came to the venerable town of Tuscon, where lingers the atmosphere of Spain and old Mexico, despite automobiles, street cars and increasing numbers of bungalows.

All of this Southwest country from the coast of Southern California eastward through Arizona is land which Harold Bell Wright loves and knows with peculiar intimacy. He has witnessed at close range the miracle that has swept over the Southwest—the miracle of reclamation and development which often has taken place in the face of terrific obstacles. Moreover, he has reclaimed several hundred acres of desert, converting it into a beautiful productive ranch. An inscription over the entrance to the Barbara Worth Hotel in El Centro, California, named from "The Winning of Barbara Worth," epitomizes this transformation which was manifest at so many points on our pilgrimage: "The desert waited silent, hot, and fierce in its desolation, holding its treasures under the seal of death against the coming of the strong ones."

* * *

The slightly rolling plain across which the straight desert road led us was in no sense a desolate waste, but dotted with creosote, and cactus which had remained green in spite of the long rainless summer and autumn. At length we saw our goal beyond a turn in the road—a rambling group of one-story buildings, Indian in their style of architecture, resting on a knoll that commanded a view of a vast plain, at the far edges of which rose jagged purple mountains. The structures were almost the color of the reddish-brown soil from which they sprang.

We rang at the heavy wrought-iron gate beyond which we glimpsed a secluded patio, and presently were ushered into a spacious living room containing many easy chairs and objects of art representing much travel and many admirers.

A tall slender figure, clad in white from head to foot, appeared in a doorway, smiling and with outstretched hand. It was Harold Bell Wright, informal, cordial, gracious, free.

I say "free" because the author confessed that he had just completed the first installment of his latest book, "A Son of His Father," and now that the thing was off his mind he felt like a new man.

It was perhaps an hour later that Wright and I found ourselves separated from the rest of the company. Thereupon he led me to an outdoor sitting room on the roof to drink in the panorama of desert and mountain encircling us. At any other time the wonderful landscape would have engrossed me. But now even the slope of the Catalina Mountains where Wright won his heroic battle against "T. B." interested me less than the man beside me. His wiry figure suggested the cowboy. His face was smooth-shaven and tanned. Bare-headed in the brilliant Arizona sunlight, there was a squint about the steel blue eyes which bespoke years in the desert.

But in the swift frequent movement of the long right arm, with its index finger picking out points of interest here and there, there was the sign of the writer and the artist. There was nothing weak about those finely fashioned hands.

Our talk ranged from books and bookmakers to camps and campers and back to books again. Many notes were struck in that running fire of conversation and many swift flashes which revealed the penetrating power of the author's mind. But if I may presume to interpret the spirit and purposes of one whose fame already has subjected him to much analysis, I would say that the spirit of Harold Bell Wright is that of a pioneer. He has helped blaze trails across the Southwest. He loves the desert not only because of its majestic solitude but also because of its challenge.

Wright and a friend whom we will call Jim were once traveling in a light roadster of uncertain vintage, which could jump a sagebrush about as easily as a jack rabbit can. A few miles east of Yuma these two came upon a perplexed motorist accompanied by a handsomely dressed, haughty spouse, three children, a maid and much excess baggage. Wright paused beside the big car long enough to indicate to the inquiring stranger (obviously a tenderfoot) the right road to Yuma. Then Wright and Jim hurried on as was their wont, only to find the big car close on their trail. Arriving at Yuma the author learned that the famous and often impassable sand dune road to El Centro had been traversed but once in the previous three days. Such was the formidable character of the sand dune trail before the none too successful plank road was laid. But when it comes to negotiating a roadster over sand the author of "When a Man's a Man" knows his stuff and despite a foreboding look from the Yuma garage man Wright and Jim announced their intention to travel westward via the sand dunes. At that moment the big car came to a stop and inquired of the gasoline attendant what was the best road to Holtville and El Centro.

"By all means stay away from the sand dunes," was the information he received, "and take the roundabout way. You'll get there quicker." Not satisfied with this advice the Easterner turned to Wright and on learning that he was traveling via the sand dunes announced that the big car would follow. Warnings and explanations were of no avail and he started out behind Wright's roadster calling out to his unwilling guide (whose identity he did not suspect),

"Now don't go off and leave me."

Wright and Jim didn't. They had penetrated only a few miles into the Sahara-like stretch of sand when the big car stalled. There was nothing to do but go back and dig it out, deflate the tires and start the tenderfoot on his way. Not once but again and again and again were the author and his friend called on to get down on their hands and knees and extricate this motorist who knew not the first thing about the trick of driving in sand. Furthermore he seemed to lack the nerve necessary to charge a sand drift at thirty or forty miles an hour even though such was the only way to make sure progress.

Each time these two volunteer helpers there in the desert bent to their back-breaking task of starting the big car, the lady on the back seat looked down on their labors with just a suggestion of superiority and there was an unmistakable implication that "these desert men ought to help folks out when in such terrible distress as we are."

Once she deigned to converse:

"By the way, mister," she inquired, "did you ever read that book called 'The Winning of Barbara Worth?' Don't you know, this sandy country about here somehow makes me think of that fascinating story."

I fancy that Wright's face was a study. But he says that he "never batted an eye" and allowed that he too had read the book. But conditions were going from bad to worse. Night was coming on and it began to look as though the strangers would be stranded there in the sand with only Wright's meager supply of water and food for the children, not to mention their mother and her pompous but incompetent driver-husband.

At this critical juncture, and just as it would have been planned in the movies, rescuers appeared in the persons of two desert men driving over the sand dunes like mad from El Centro and toward Yuma. Wright descried them from afar and hurried to them before the

Corner in the patio showing statue of a Papago Indian making the sign of "peace" or friendliness.

The garden in front of the Wright home, composed entirely of desert flora such as suhuaro (giant cactus).

big car was within earshot. "Men, I ask you two favors. First, when we get back to that big car there remember you never saw me before. I am unknown to you, at least by name. Second, I want one of you to give up your trip to Yuma and drive that car to El Centro. We'll make old Money Bags ride with us. Otherwise we'll never get out of here tonight."

It was agreed and the new arrivals played their part as instructed. The owner of the big car volubly declared that "no one will ever drive this auto but me." However, some pointed remarks by the author incognito changed his mind. Another two hours of "bucking-broncho" driving brought the big car and its more or less terrified occupants to the edge of the sand dunes and on into El Centro. They were only a few yards behind Wright and Jim in their leaping tuna of a roadster. Wright thought he had played his game of unrevealed identity pretty well and rolled up to a service station glad that he had been able to share in rescuing a party of travelers, even if they were not very pronounced in their gratitude.

At that moment the service station attendant appeared in the doorway and called out, "Hello, Wright!"

The author turned his head and caught a glimpse of the lady of superior mein in the big car. Her face was a study. In swift succession expressions of incredulity, amazement and humiliation swept across her features.

"Are you Harold Bell Wright?" she gasped. And the author smilingly plead guilty. It is safe to assert that this new arrival in the West thoroughly learned the lesson that in this big outdoor country one must not judge by appearances.

I was tremendously interested to find that a man who so thoroughly enjoys the open country could hold himself unerringly to an indoor program of writing. Readers of this article who have enjoyed "Their Yesterdays" will recall that two of the thirteen fundamental and indispensable things of life which are listed in that book's opening pages are "dreams" and "work." I found Wright practicing what he has preached. After years of writing under all kinds of conditions that most authors would pronounce intolerable, this author has finally built for himself a home which is primarily a *workshop*.

Looking out through the dining room door across the patio to the "front gate."

As much thought has been given to Mrs. Wright's room where she does all of the copying and correspondence typing, and to Mr. Wright's study, as to the spacious living room and dining room. In fact, I think the study must have been planned first and other rooms built with reference to it. It is a writer's paradise. Lighted on three sides by large windows that look out over desert and mountains, there is nothing distracting in the surroundings of this workshop. A thick cement wall shuts out the sounds from other parts of the house. The windows offer no glimpse of activities in the garden or outbuildings.

The interior of the study is unique in that there are no decorations of any kind save a frame and long-cherished picture of Hoffman's "Christ." The ceiling, walls, floor and furniture—the latter all designed by the author—are of one uniform tint, a pale green which is most restful to the eyes. Two or three tables, and arm chairs (one with up-slanting arms to hold a writing board), a dictionary stand, a pulpit-like desk, and a well-filled case of reference books—these constitute the furniture. Wright often moves from one desk or chair to another as he works.

At the end of the study Mr. Wright showed me the sanctum sanctorum—the fireproof vault in which all of the original manuscripts are housed. Here we handled pages written in those far-off days when only indomitable faith in himself enabled the unknown Harold Bell Wright to labor for weeks and months to perfect the messages in which he believed. Here, too, he showed me the argument and outline of the book, "A Son of His Father" which is now engaging his mind and heart. And most significant of all were thirteen large envelopes, each neatly typed with "working titles"—the accumulating essence of books that are yet to be written.

Here is a man whom the world would say had arrived. According to the thinking of the superficially minded "he doesn't need to work any more"—just as though work were something from which we *all* are trying to escape. But if I judge Wright truly, it would be as impossible for him to stop working as to stop breathing. Despite his full realization that he must carefully conserve his strength, I caught no intimation from this man of much achievement that he ever looked forward to the day when he would "quit and take it easy."

And with Wright "work" means creating. The physical labor of writing a page of manuscript in longhand may seem slight enough, but put into that page a glimpse of forlorn little Barbara Worth beside her nameless mother who is dying of thirst on a desert as fiercely hot as a furnace—and make this glimpse so vivid and real that it brings tears to the eyes of the reader—then, when such a page has been written, an author has labored intensely. Day after day Wright is devoting himself to such creative work. All America knows the characters he has brought into being.

The north terrace overlooking the desert in its natural state. The stairs lead to the flat roof.

That is the reason that pioneering in a new country appeals to him. Though chiefly a creator in literature he also has shared the hardships of pioneering and reclaiming. Those engaged in such work are bringing something new and worth while into the world. Too great a proportion of mankind is satisfied with mere routine, he says. Those with the instincts and aims of creators are rare, but they find stimulus and opportunities for development in every new country.

With the enthusiasm of a boy Wright explains how they had surrounded their new desert home with the plants of the desert instead of importing "civilized" trees and shrubs. He showed us his promising hedge of ocatilla. "A wonderful plant," he exclaimed, as we cautiously fingered the long slender branches, heavily barbed, springing from a common base. "Its hardihood is absolutely amazing. Without rain it will stand for months and months, dry and apparently dead. Then, no matter what time of year, throw a hatful of water on it and it will burst into green leaves." And the author with a quick gesture of his outspread hands emphasized the almost magical recuperative power of this desert species.

Either side of the wrought-iron gateway (the pattern for which was fashioned in wood by Wright's own hands) stands a fine specimen of giant cactus, decorative and suggestive of dignity as any trimmed boxwood on an English estate. Similarly, other desert plants and shrubs have been utilized to wonderful advantage. All of this necessitated a good deal of painstaking experimenting, for as far as the Wrights were able to learn, no one else has undertaken to plant an entire home grounds with indigenous desert flora. The past two years have shown what can be planted from seed and what can be transplanted, with the result that the grounds, already most interesting because unique, are to be made increasingly beautiful, all the way from the little guest house and swimming pool down the slope to the garage and pump house and out toward the stables and corral where the saddle horses are housed.

A moment ago I mentioned dreams as one of the things which this author counts among life's essentials. His dreams go hand in hand with his work. His home which is his workshop is the fruit of dreams. A few seasons ago he was stricken with pneumonia as the result of working in a damp, cement-floored house. There was but one thing to do, as soon as his condition would permit, and that was to get out into the open air and sunshine. Mrs. Wright discovered an attractive knoll out in the quiet of the desert. Here she set up a tent and a ramada (a four-posted shelter from the sun) and here Wright spent the summer recuperating and writing. It was an experience not unlike the one he had on the slope of the Catalina Mountains in his successful fight against "T. B." but not so desperate.

While that book was in the making, this man was dreaming of a home—a work place where he could gather together all of the things which count for worthwhile living, and where he could get away from the non-essentials, the things which sap and suck one's strength.

The veranda and its varicolored Indian rugs and wicker furniture, facing the patio.

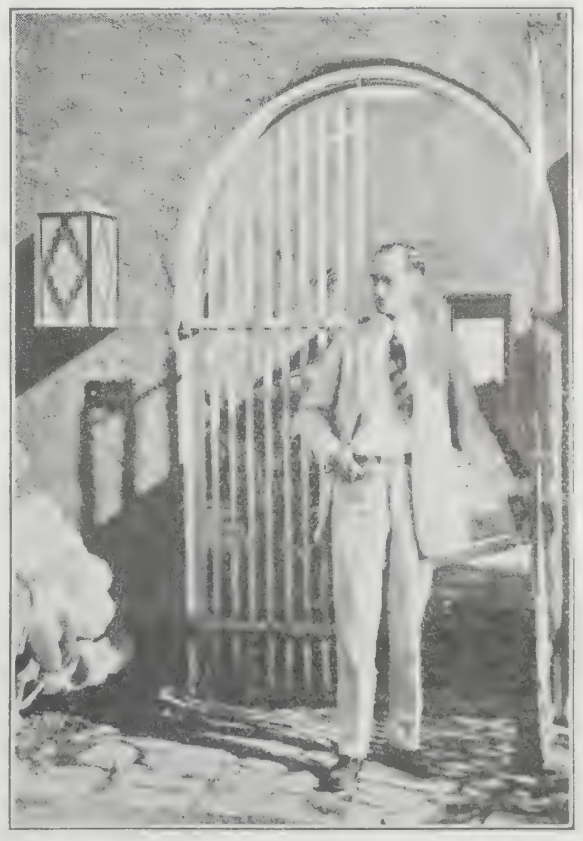
The book sold well and when the first check for royalties came it was sufficient to pay for the building of the dream house, on the very knoll where the book was written.

But this man's dreams cover a far wider range. Like the true pioneer that he is, he is dreaming of the future, forgetting the novels and successes that are behind, he is pressing on toward the things that are before. His thoughts are on those thirteen books. Of them he dreams, hoping that they may be finer and better than anything which he has yet produced.

Life is a serious matter with Harold Bell Wright—he has faced the realities too many times not to be serious. And yet his sense of humor is always just beneath the surface, ready to crop out at any time. For example, not long before I bade him goodby I remarked that doubtless he had many callers.

"Yes," he replied with a wry smile. "We always like to see folks but it is physically impossible to meet every sight-seer that comes to this part of the country, and at the same time keep up our work. Why, the other day I was at work in my study when presently I felt a creepy feeling up and down my back and turned around. Behold, there were three good ladies, their noses pressed against the windowpane, their hands shading their eyes, peering in at me, as though I were an animal in a zoo!"

Things like that nettle Wright just as they would anyone else who loves privacy, but he is not so serious minded as to miss the humor of the situation. His big concern is "following the trail." For him each day opens up new unexplored country. To his chosen task of original, creative thinking he brings remarkable power in description, plot building, and character portrayal. In the books of Harold Bell Wright that have been written and in those thirteen yet to be written will be found the log of a pioneer, the record of a man who dreams and works for the joy of working.



Harold Bell Wright at the entrance to the patio of his Indian-style desert home near Tucson, Arizona.

How to Balance a Nourishing Diet—By MARY E. BAYLEY

THE most important foods which contain all the amino acids necessary to build the protein of the body are, milk, cheese, flesh foods, and eggs. The proteins of beans, peas and most nuts cannot be depended upon unless aided by one of the "complete" protein foods. And those most useful are milk and meat. Milk is, however, better than meat as a supplement to these "incomplete" protein foods. This is true not because its protein is superior to meat, but because it furnished other valuable elements—namely vitamines and minerals.

It is true also because of the fact that meat generally tends to take too big a place in the diet. Meat contains excessive amounts of acid-forming elements, and for this reason, to secure best results in nutrition, it needs to be combined properly with foods rich in bases of mineral nature. An excessive consumption of meat tends to promote the generation of toxic substances. These toxic products exert an irritating action on the lining of the intestine. They burden the liver and kidneys. And altogether in time produce a condition unfavorable to health.

There is one other fact which modern studies in nutrition *have tended to prove* (though perhaps not proving conclusively), and this is that there is no essential difference in the character of the diet which will best support well-being in persons of different ages. That is, there is no important difference in the nutritive requirements of the young and the adult. While it is true that certain foods can be safely taken by the adult, which are not suited to the delicate digestive tract of the young child, it is by no means certain that the adult will be well nourished and his vitality maintained at a high level by diets unsuited to the child of four or five years. Indeed there is more reason to believe that such diets as maintain normal growth and vigor in children are physiologically superior to any not fulfilling these requirements. For in animal experimentation it has been found that diets which were not suited for the promotion of growth in the young caused damage to adult animals restricted to them.

The question of proper nutrition is really based upon four principles, the great importance of which has come to light through comparatively recent studies:

First. That a more generous use of dairy products is essential. Milk is particularly valuable for supplementing other foods and for specifically correcting their deficiencies. In addition to its mineral properties (particularly calcium), its complete protein and the vitamines (particularly fat soluble "A"), milk also serves in another way. It encourages in the intestine the growth of lactic-acid producing bacteria (the cause of the souring of milk). These help to rid the intestine of those types of bacilli which cause putrefactive decomposition of the food residue.

Second. In the leafy parts of vegetables there are dietary properties which are unique among foods of vegetable origin. Eating leafy vegetables in liberal amounts provides the body with substances which it cannot secure in adequate amounts from potatoes, milled cereals and muscle cuts of meats. Leafy vegetables are also of importance because they leave a bulky residue which promotes prompt elimination and thus aids in maintaining the intestinal tract in a hygienic condition.

A diet consisting largely of meat, white bread, potatoes and sugar is low in indigestible matter. It leaves but little residue for the intestine to cast off, but this residue is of a physical character unfavorable for elimination. By the enormous amount of cathartic drugs used, it is quite evident that constipation is the heavy burden of countless thousands. It is practically impossible for anyone to become constipated who eats liberally of green leafy vegetables and salads. Regular eating of these would tend largely to correct faulty elimination of practically all, except those who have badly damaged their intestinal tract by long-standing abuse.

Third. We should eat at frequent intervals raw fruits and raw vegetables, to make sure of securing a sufficient amount of the anti-scrobutic substances, particularly vitamine "C." This vitamine is the most unstable of all and when foods are cooked, dried, dehydrated, preserved or canned, it is rapidly destroyed.

Fruits and vegetables are also important because their ash is alkaline and thus they aid in establishing an alkali reserve in the blood.

Fourth. That meat, since it contains an excessive amount of acid-forming elements, needs to be combined properly with foods rich in bases of mineral nature—milk, leafy vegetables and fruits.

Learning to keep the diet on the safe side as proved by scientific experiment is not a difficult problem. It is really quite easy. For it does not involve the learning of long and intricate "calorie tables" as at one time thought. Reduced to simplest terms, it consists merely in seeing that each person has every day:

A quart of milk or its equivalent. This may be taken plain, in cocoa, ice cream, cheese, milk toast, milk vegetable soups, cream vegetables, junket, and other desserts in which milk is used.

One liberal portion of some cooked green leafy vegetable. In addition to cabbage, Brussels sprouts, turnip tops, and all the spinach family, there is included among leafy vegetables, string beans and asparagus, since these contain practically the same dietary qualities. The onion, since it is a mass of thickened leaves, is also classed with leafy vegetables. The onion is rich in mineral content, particularly iron (in this particular respect taking the place of red meat); it contains all three of the vitamines; its protein supplements the deficiencies of the protein of other vegetables, and, in addition, the onion is a corrective for constipation.

Two salads every day. Perhaps one for lunch or supper and one for dinner. These to be made of fresh uncooked fruits or vegetables, such as cabbage (as served in cole slaw or cabbage salad), lettuce, water cress, apples, oranges, tomatoes or other fruits and vegetables that can be served raw.

If of these foods (milk, green vegetables and salads) there is taken an adequate minimum, they will crowd out of the diet a considerable part of the meat, cereal, bread, potatoes and sweets, one would otherwise eat. In other words, if these foods are made first essentials in the diet (with other foods secondary) one may with reasonable safety go ahead with the dictates of the appetite.

It is well to make a practice of taking small servings of meat. And to eat meat but once a day is a safe rule to follow. Eggs contain nearly everything the body needs for its development, except sufficient calcium. They are, however, unbalanced with respect to other food principles.

In using eggs, they should be regarded as additions to the cereal, potato and root vegetable foods, to improve its quality. A diet in which eggs predominate is harmful, since, like meat, they tend to favor the growth of putrefactive bacteria in the alimentary tract.

The average person would doubtless accept the following menu as a satisfactory dinner. It is interesting to note also that this complies with the older standards *of chemical composition* which were supposed to be adequate as a basis of judgment:

Veal cutlets, boiled or baked potatoes, buttered peas, gelatin salad, bread and butter, mince pie and coffee. And yet in the light of the new principles which we know are the basis of satisfactory nutrition, the menu given is a very unsatisfactory one. It is derived entirely from muscle tissue of meat, potatoes, a legume seed (peas), gelatin (a protein from meat or bone), a cereal (bread), meat and fruit from which mincemeat is prepared and a fat (butter). We now know that, to have our diet physiologically complete, it is necessary not only to be sure that it contains enough of all the substances which it is known how to estimate chemically, but food must be selected from *certain sources*.

To return to the menu in question, it is a simple matter to modify this, by the addition of milk and eggs, and make it correct from the standpoint of satisfactory nutrition. If we substitute breaded cutlets (dressed with egg and bread crumbs), mashed potatoes to which has been added milk, creamed peas, gelatin salad, bread and butter and caramel custard, we have a meal, not differing from the former in attractiveness and palatability, yet one decidedly superior for the maintenance of health.

There is a real need for a better selection of foods than now practiced in many households. Adherence to the simple principles now well established by scientific discoveries in the field of nutrition, namely, a liberal use of milk in various ways, the daily use of green vegetables and the eating of salads, cannot fail to contribute to health, happiness and achievement.

Elmer Bowman—"A Vanishing Species"

Concluded from page 3

wild turkey, quail, and dove. The islands and tide-level swamps are the natural home of water fowl such as gulls and terns, rails and coots, cormorants and stilts, grackles and curlews—all breeding literally in uncounted millions.

Comparisons are not always odious. Texas' obligation to "hook up" with Louisiana, as Elmer Bowman put it, is too obvious to justify argument. The simple fact is that Louisiana provides stringent protection for the east side of the Sabine while Texas provides none whatsoever for the west side.

"The rapid decrease of wild life in numbers is apparent to all interested observers," writes the Texas game and fish commissioner, noting that "a recent census of the antelope in Texas shows that we have 547 head," whereas, fifty years ago, the Texas spotted antelope was numbered in the hundreds of thousands.

"The Department of Conservation is in control of all the natural resources of the state except the soil under private ownership," solemnly affirms the Louisiana conservation commissioner, in reporting the progress made in the protection of wild life in the state and its "really remarkable increase."

Texas has a closed season on the shooting of wild fowl and game, conforming to the Federal law, but fur-bearing animals are wholly unprotected except in one county. There are no prohibitions on trapping, the license system is unknown, and no restrictions exist on the possession, sale and shipment of furs. It is gratifying to note that the consent of the owner is required for trapping on "posted" land, and that, responding to a stirring public conscience, *verboten* signs are coming to be rather common. But on anything like a comprehensive scale the state legislature of Texas has not acted, nor given the pressing problem of imperiled wild life even a respectful hearing.

It may be ventured that the fur-bearing species reason after some fashion; atavistic, perhaps, but cogent. Elmer Bowman's pessimistic report of a westward movement of the game is apparently confounded by the fact that trapping has always been more successful on the Louisiana side, although the lay of the country is the same on either side of the Sabine River. In my swing along the Texas side, where trapping was being conducted without restraint, it was found that the harvest was poor: "Sleem pickin's, *voila!*" answered one tall *cajan* trapper. Since Louisiana protects while Texas does not, the reasonable answer seems to be that the game is "hep" to where comparative safety lies.

Among its other excellent conservation laws Louisiana imposes a closed season extending from February 15 to November 15 on the trapping of fur bearers. Rats may be taken at any time when found to be injuring levees, and a further broadening is left to the discretion of the department of conservation whenever it is found that rats are doing damage to cultivated or pastured lands.

Louisiana collects a severance tax of two cents on the current market value of all skins, the alligator being included in this category. The tax is paid by the dealer. The trapper, buyer and dealer, including the non-resident dealer, are licensed, the license fee being, respectively, $1.25, $4, $25, and $50 per annum. The industry is further stabilized with the barring of itinerant trappers; that class must have resided in the state six months to secure a license. The trapper is encouraged by a new law permitting him to ship out his own catch without securing a dealer's license, but upon the payment of the severance tax. Fur buyers and dealers are required to keep records of purchases and sales, and to make monthly reports to the conservation commissioner.

Louisiana goes further. It regulates the breeding of fur-bearing animals, elk, deer, wild game birds and wild waterfowl in private preserves, through the license system; requiring the marking of propagated game offered for sale and shipment, licenses for sale, semiannual reports, and the types of fences to be used. Non-game plumage-bearing birds are fully protected.

Besides having wide discretionary powers, the conservation commissioner is authorized to spend annually up to $175,000. The department is self-sustaining, in no way adding any burden to the general expenses of the government. The commissioner said: "The progress made in the protection and development of Louisiana's wild life resources has been really remarkable. We can look back just a few years to the time when certain species of game native to Louisiana were threatened with absolute extinction; while today, from every section, we get the most encouraging reports of increases in the numbers of all species.

"The wild waterfowl has increased enormously. The State of Louisiana has set aside a tract of 60,000 acres of land for use as a public shooting ground. A clubhouse has been erected. Here any citizen of the state who has a one-dollar hunter's license may enjoy the privileges of an up-to-date sportsmen's club. The public shooting preserve is situated at the mouth of the Mississippi River. Last season's kill of ducks was 11,297."

The state's fur industry, the commissioner said, has developed into an asset of highest importance. With 10,000 trappers licensed, Louisiana leads all other states in the catch and sale of muskrats, while the value of the annual fur crop is placed at four million to five million dollars. The season of 1920-21, one of the poorest in the history of the fur industry, showed a reported catch in Louisiana of 1,271,364 fur bearers, divided as follows: 900,170 muskrats, 160,683 raccoons, 131,553 opossums, 66,315 mink, 12,322 skunks, and 321 otter. The receipts of the department of conservation exceeded a quarter-million dollars.

We managed, that last day, to catch nine rats and four hundred pounds of buffalo fish—in hoop nets, too; and Elmer sold the fish to Joe Pavell at Orange at six cents a pound dressed. The grizzled patriarch of the Bowman hunter-fisher-trapper clan was gloomy as he squatted on the edge of our tiny—and getting tinier—island to bathe his bloody arms in the softly rising flood.

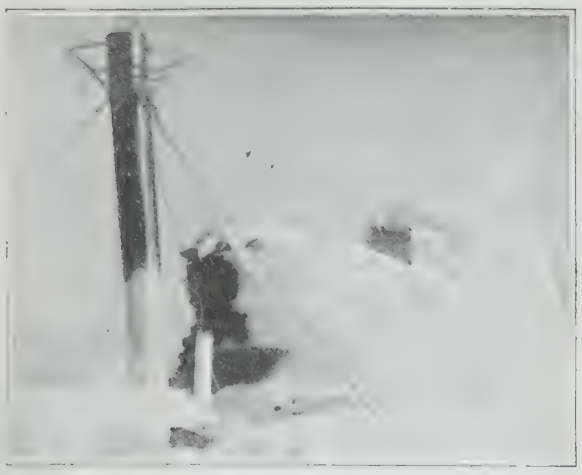
"Season's over. We're done for two months," he announced. "Tomorrow there'll be poachers at this place with seines, right here on my land, and they'll catch a couple thousand pounds of buffaler. What's a law-abidin' family like ours to do, and me with fifteen huskies to feed! Say, Mister, you tell 'em—great *gosh*, looky yonder!"

Formed in a perfect V, a flock of Canada geese rushed across our vision, Canada-bound, flying low but climbing, swift and true as a bullet. Then they were suddenly shut out by the tops of the tall trees over our heads. Elmer looked at Robbie with shining eyes and Robbie gave his father back his look. November only nine months away!

Shall Black or White Dominate South Africa?

Concluded from page 5

ing propaganda which extends to the remotest corners of the country. In the realm of native affairs the attitude and operations of the new administration will have their most important bearing upon the future of South Africa. The native is not quite persuaded that his interests are in sympathetic hands when he is being dealt with by the party of the *back-veld* Boer, and the declaration of policy now made has created no slight sensation in quarters where some indication of policy has been anxiously awaited. The declaration, if made effective, means something of a revolution in mining conditions, and the closing down of areas which are being worked solely because costs are low. At this point, however, South African Labor has something to say. The Laborists are ready to urge that if mining areas are abandoned on such grounds, these be taken over by the state and worked with low-priced native labor as before: Low-priced labor for the low-grade areas *under nationalization* is the program in reserve; for the high-grade areas, more White labor. The developments which are in prospect in other directions—more irrigation, fruit-growing, larger areas under tobacco, and great stretches of country under cotton—should tend to the relief of the general situation; but the native remembers that *back-veld* opinion has always been candid on the subject of the huge areas of splendid territory in the native reserves, and there will be some misgiving in native circles in this connection until it becomes clearer how Nationalism will proceed to preserve White civilization in South Africa.



Ice or frost feathers wrecking the meteorograph masts on Mount Rose.

Snow Surveying on the Sierras

With the Weather Men at Mount Rose

By GUSTAVUS S. PAINE

I HAD always maintained that I wanted to climb a mountain just for the fun of climbing, and not to do any work either going up or coming down. Once, however, I went up Mount Rose, Nevada, in the summer with a botanist, and spent a week scraping lichens and other discolorations, which didn't mean anything to me, from the rocks to put them between the leaves of huge specimen books that we had to pack on our backs down the mountain side. It was a memorable lesson, but that week I learned that to see Mount Rose at its best one should go up in the winter, and to have the finest kind of winter trip one should make the climb with a snow surveyor working for Dr. Church, of Reno.

Snow surveying is a comparatively recent development in the United States, or anywhere else for that matter. In the Sierras, Dr. J. E. Church, Jr., of the University of Nevada, has established regular snow courses, which for some years he has sampled carefully each season. The purpose of this curious work is to give to the ranchers and power companies of the valleys forecasts of the amount of water they can expect in the spring and summer. For this work, he has had to develop a technique all his own.

Among the loose rocks at the very top of Mount Rose he constructed at the start a tight little cabin, with bunks as on shipboard, and one tiny window looking out over all of Lake Tahoe about five thousand feet below. A stove, a table, a collapsible chair, a bin lined with sheet iron for food supplies, and all sorts of instruments for recording the weather at that vantage point, take up nearly half the cubic space in the cabin. Fortunately for me I did not have to pack any of those things up there, but I have been grateful for many of them after several hard climbs.

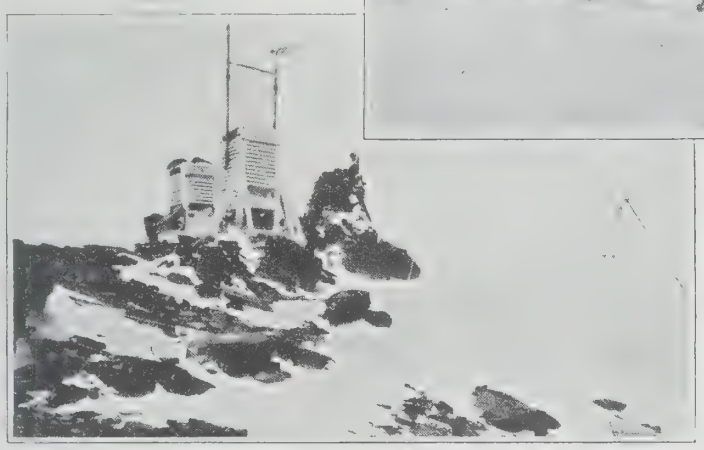
With the long light snow samplers in sections tied together over my shoulder, and with a knapsack and snowshoes on my back, I started out one January day with a university upper classman for my first actual experience in snow surveying. We had spent the night in the stone outbuilding at the old Wheeler ranch, which had once been a cache for stolen goods. There Dr. Church kept bedding and food and fuel behind a stout door with a big padlock. So we were fresh in the cool of the morning for the climb of some five thousand feet. From the start there was snow on the ground, and it became deeper and deeper as we followed the old wood road that petered out as soon as we came to the last willows in the first ravine. There I wanted to follow the trail that I knew doubled back and forth up the bare right side of the canyon, but my superior officer declared there was no trail and that the only way was straight up the rocks ahead. So up the rocks we went. The jangling samplers, the knapsack, and the snowshoes had to be shifted almost every ten feet, but we finally made that first top, and sat down to look at what was before us. From there the climb was more gradual, through second-growth pines where the first growth was cut off fifty or sixty years ago for timbers in the Comstock mines, and past the spot that in summer was a brackish pond, but which now was a mere depression in the snow. On we clambered up the rocky mountain side, every now and again crawling on our hands and knees through the terrific wind which had long since laid low the scrub Alpine white pines, among which we soon found ourselves, and had kept them twisting along the ground in their determination to live.

It was a good day's work to get to Contact Pass. Here Dr. Church had put up a halfway shelter hut of bags filled with sand and tarred on the outside, a Black Hole of Calcutta in which I had vowed on previous trips that I would never stay overnight. Stay there we did this time, however, for it would have been impossible to have made the top in the dark and the wind. The bed on the floor was made of blankets and rabbit skins. When we lay down on it, after having cooked our supper out of some cans, and closing the door and the thick shutter at the window to keep out cold and wood rats, I realized that never before had I been in such a totally dark place. With my hand only a few inches before my eyes, I could see no faintest indication of its being there. Nevertheless we soon slept.

In the morning we went on. From Contact Pass the walking is still harder, but it is all just walking, and not climbing up rock ledges as in the Alps. Anyone with ordinary endurance can do it. We saw very little animal life, only a few great white rabbits. The thick underbrush which grows up through the loose rocks was so heavily covered with snow that we could walk over most of it, hardly knowing it was there. Here, in fact, was one of Dr. Church's snow courses, to which, however, we now paid no professional attention, as we were to sample it on the way down. Crossing finally the last hogback, we saw the quiet three hundred square miles of dark blue Tahoe on our right just below, a great savage cup in the speckled white Sierras, a cup whose contents Dr. Church carefully measures for the benefit of the ranchers and the power companies.

From this point it was only a few minutes to the top. I had not used my snowshoes at all, as the crust had everywhere been sufficient to hold me. We undid the bars across the door of the cabin, and went in for a few minutes out of the wind. However, we soon had to inspect the little kiosk full of instruments a few yards away. Here the velocity and direction of the wind, the amount of snowfall, the barometric pressures, and the temperature are all recorded without human attention for weeks at a time. The instruments are sometimes almost overwhelmed by onslaughts of frost, but we found that they were surviving.

Of course, when the actual measurements of the amount of snow on the ground have been gathered, the effect of the wind, the temperature, and the moisture in the atmosphere on the melting and the evaporation have to be taken into account. These corrections were especially necessary when the whole work was experimental, and before the more or less permanent snow courses to be measured were decided upon. To the man in the street, it seems easy enough to say roughly that the amount of snow in any one year is 90 per cent or 120 per cent of the normal; but many factors nullify the reliability of casual observations. And then, too, a normal has to be determined through years of study, if the predictions are to be of any value to the water users.



Above—Mount Rose Observatory, 10,800 feet. Below, left—The weather recording itself on Mount Rose. Right—Ward Creek basin at crest of Sierra Nevada.

In the morning, after an almost air-tight night in the cabin, because wood rats in the place would have lessened our happiness there, we started down. The first snow course extends directly down to the north from the peak. From there we took forty measurements in a straight line one hundred feet apart. The samplers are steel tubes which can be forced down even through ice because of the sharp bottom edge. Now and again I had to exert my whole weight on the handle-like arrangement clamped to the top, but always after a good deal of effort we managed to reach the bottom of the bank, and bring up a core of snow to be weighed at once. We also noted down in the book the kind of bottom reached, whether of soil, rock, or underbrush, evidences of which showed on the lower end of the sample. Ten feet of snow on top of manzanita must be interpreted somewhat differently from ten feet of snow on a rock surface. Out of all the measurements, taken year after year in approximately the same places, a working average, with corrections for all sorts of conditions, is achieved.

It was so pleasant a morning that we worked without our coats and sweaters in the bright sunlight. Nevertheless we slipped and slid a good deal on the crust, and when we came to another course lower down sheltered by Alpine white pines, we bundled ourselves up again. After a few thousand feet of sliding an automatically winding tape measure over ice or rough snow, and putting together sections of the sampler and taking them apart, the surveying becomes tedious. An amateur like myself would naturally be tempted to fake some of the measurements for the sake of speed; but fortunately my superior on the job had a more scientific temperament. So we were accurate, even when we came to the edge of a snow bank, and had to record only a few inches of depth.

Mount Rose is 10,800 feet high, the chief peak in the Sierras to the northeast of Lake Tahoe. Dr. Church chose to measure the snow course there first, partly because of the accessibility of the mountain in winter from Reno, and chiefly because at that altitude his measurements would not be much affected by winter melting. Later he laid out other courses, notably around Ward Peak to the west of Lake Tahoe. He has usually selected sites in timber or in protected flats, where the winter cover is not much oscillated by the wind. Sometimes the whole cover is moved from year to year along or across the range. To predict the relative amount of water to be expected in large areas, he has divided the range into quadrangles. Three of these have already been established by the Nevada-California co-operative survey, which supports his work. One consists of the Tahoe, Carson, and Walker basins on the eastern slope, and the Yuba, American, Mokelumne, Stanislaus, and Tuolumne basins on the western slope. Here especially he has been able to forecast the spring and summer flow of the streams with sufficient accuracy to be of immense assistance to the ranchers and the power companies, and to stimulate the adoption of his methods in other regions. A year ago his plan was adopted by the city of Los Angeles, in association with the Kings River water storage district, for the basins of five Southern California rivers, and by the Bitter Root irrigation district in Montana.

He estimates the relative density of the snow each year, the effect of unusual precipitation or lack of it during the period when the water is beginning to run off freely, and the influence of the temperatures at all times. He also has to take into account the varying natures of the different parts of the basins which he surveys, whether they comprise bare rocks, or soil-covered slopes, and whether they are denuded of their forests or still wooded. For all this he has had to enlist the aid of winter caretakers at summer resorts and at dams, such as that at the Blue Lakes, ranchers and flume tenders, and other isolated mountaineers. It is fascinating to come upon such men in midwinter, who like even the slight relief from monotony which this work that takes little of their time gives them. They are all tiny parts in this almost unknown phase of the tremendous irrigation and power development that is so steadily going on. Their individual crest stations and outposts look fragile enough, but they indicate to those who more and more each year are pushing into the mountains on skis that guesswork in connection with the water supply of the arid West is giving way to accurate knowledge.

Actually standing on a snow course, I could realize how misled a rancher often is when he merely looks up at the mountains in February and congratulates himself that there is a good deal of snow there this year. What he sees after the big storm of the season may be comparatively local, and then, too, it may not be dense enough to furnish him with anywhere near the amount of water he expects from it. Important as the work is, therefore, nevertheless Dr. Church's individual initiative had to develop it for many years in the face of all sorts of skepticism. The United States meteorological service could co-operate with him only after his own persistence had demonstrated its practicability. Only now is the interest in it becoming at all general, though the plan was first conceived some fifteen years ago.

Dr. Church went to Nevada as professor of Latin and Greek in the university. He started climbing Mount Rose and the nearby peaks in the Sierras in much the same amateur spirit that I or anyone else would be content with. He soon found, however, that in this mountaineering there were possibilities for humanitarian effort that would relieve him somewhat from looking upon his academic work as a little remote from life.

When Co-operation Has No Strings to It

Concluded from page 4

the Rice Growers' Association of California, since there was no monopoly, and since the crop must move upon values fixed by world movements of rice and other food crops. Price-fixing in co-operative marketing is economically unsound, unless it is used as an incident to the method of merchandising, according to the management of the rice-growers' association. It became essential, then, to find an ever-expanding market for rice, not only for present crops, but for the increasing crops of the future. Up to 1921, very little rice grown in California had been exported, but, through connections which Mr. Merritt established by way of the Japanese delegates to the disarmament conference at Washington, a market for practically the entire California rice crop of that year was found in Japan. The year before, under the old management, an even greater and hungrier market for California rice existed in Japan, but had been neither discovered nor opened to the American rice-grower.

This finding of new markets, expansion of present markets, and development of new uses for the product, all combining to reduce buying resistance and increase consumer acceptance, is one of the main factors in the success of any co-operative association engaged in the marketing of foodstuffs. Yet it is a remarkable fact that *not one of the more than a score of co-operative farm marketing associations operated on the Sapiro Plan, with which the writer is familiar, has attempted to do any one of these things.* The Rice Growers' Association of California obtained information on the supply of and demand for rice in the Orient not only through the Department of Commerce of the United States Government, but sent Charles H. Johnson, senior field agent of the association, to Japan, where he gathered and brought back to association headquarters complete and detailed information of the Oriental rice market. Through these efforts, a place of sale for the entire California rice crop has been found. As far as the writer has been able to learn neither the Arkansas, Louisiana nor Texas rice-growers' associations—all Sapiro Plan organizations—ever have made any attempt to so broaden their markets, or increase the sales field for the product of their membership.

It is idle to reply to this statement—as officials of Sapiro Plan co-operative marketing associations have replied to the writer—that "this sort of international marketing can be done with non-perishable crops, such as rice and wheat, but cannot be done with fruits, such, for example, as prunes, apricots, peaches and pears." This answer, of course, is really an attempted excuse for the troubles which befell the California Prune and Apricot Growers' Association, previously described in these columns. *Yet the raisin-growers are selling their product,* a dried fruit similar in character to the others above mentioned, *in every country in the world.* To do this requires capable management, competent salesmanship, and adequate methods of distribution. Doubtless it is too much to ask this of the employes of the ring now engaged in the internationalization of the crops of the United States.

The records of the Pacific Rice Growers' Association, prior to its reorganization and its adoption of business principles in 1921, show that, for the twelve months prior to its reconstruction, its expenditures reached the amazing total of $145,758. This does not include a large amount of unpaid bills, left as a legacy to the Rice Growers' Association of California. In contrast to this, the expenditures for the first year of operation of the new association, according to the Yearbook of 1922, amounted to $54,636.44, a reduction of about 60 per cent. In addition to this, the Rice Growers' Association of California paid up $11,769.08 of obligations of the old association, and in investment in the capital expenditures taken over from the old organization.

In his report for 1922, Mr. Merritt gives some other interesting facts, thus:

"It is of interest to note that the Pacific Rice Growers' Association expended $5,000 for the solicitation of new members, whereas the Rice Growers' Association of California has not expended any money whatsoever for the payment of solicitors in obtaining a strong control under its five-year contract. In a similar way, our predecessor expended more than $25,000 in grader's expenses, while the present association has spent $2,158 for the same purpose. . . . In one month, seventeen foreclosures upon the lands of our members have been forestalled by the action of the association, and these members are now re-financed and in possession of their respective farm undertakings."

There is no record that any management of any Sapiro Plan association ever reduced operating costs, or ever took a single step to save a member from financial loss.

In the yearbook of the Rice Growers' Association of California for 1923 appear comparisons between the results obtained for the rice-growers of California with those of the same farmers in the southern states, who, it should be remembered, operated under the Sapiro Plan:

"Within the lines of our own commodity," says this yearbook, "we have seen with regret that the past year (1922-23) has not brought new hope of prosperity to the producer of rice in the southern states. Threatened by weak credit facilities, and *inadequate marketing machinery,* the southern rice-grower has passed through a year of discouragement equal to the worst period of two or three years ago.

"As compared to the southern situation, our own has been indeed one of contrast, and the lesson to be learned is that the theory which has prevailed up to two years ago that our own level of prices was dependent upon the New Orleans Exchange is only remotely true. If we had been dominated this year and last year, as our rice markets heretofore were dominated, it would have meant utter wreck and ruin to the rice-growers of California, but, happily, we have found our way out from under the idea which speculative interests formerly imposed on us, and we have found independence and a larger measure of permanent stability and prosperity."

One of the features which has proved of prime value in developing uniformly the interests of all the members of the association has been the confidential market letter sent at regular intervals by the management to the membership. By this letter, growers—who, it will be remembered, control the time of sale and the selling-price of their product—are kept informed of general movements of rice, and of opportune peaks at which to sell. The yearbook of 1923, in this connection, says:

"The result of the association merchandising policy, including the earlier movement of damp and off-grade rices, has been that the industry has been more successful this year, on a comparative basis, considering the problems to be met, than last year, and it has met with the greatest success of any industry in this country during the past twelve months. Moreover the average return to our growers has exceeded the average return to independents who, this year, overheld on damp rices and sold in disorderly volume almost at the bottom.

"Careful observation of the attitude and reactions of our membership to this confidential information supplied through the market letter and otherwise confirms my judgment that *the rice farmers, with proper facilities, could be relied on to formulate wise policies affecting their own particular holdings.* The past year's experience of this association . . . . indicates that our members required only a source of adequate information, interpreted and condensed to meet their needs, and an unfailing distributive channel through which they might act, in order to supply soundly the sale decisions for that part of the rice each produced.

"I believe," continues Mr. Merritt, "that the clause in our contract allowing each member to fix the minimum sales-price on the rice grown by him, which represents an entirely new idea in the co-operative marketing of our type of commodity, and which has attracted so much discussion over the country, has justified itself. It has resulted in a wholesome sharing of responsibility for sales between the members and the management, and in a lively interest by every member in the merchandising problems that inevitably appear in the handling of any crop. The members are acquiring genuine sales-technique, as distinguished from cloudy, uninformed speculation. I believe that we have contributed and demonstrated a new principle in the distribution of a commodity in a world market, where price and demand are beyond local guidance."

These are the fundamental factors in the success of the Rice Growers' Association of California since its reorganization. They are absent from the disastrous Sapiro Plan of co-operative marketing, and from all the associations organized and operating under that plan. The rice-growers' association, no less than the raisin-growers' association, are outstanding examples of the manner in which co-operative marketing organizations can be made to function successfully. They are worthy of the careful study of every farmer in the United States, whether he has been victimized by other forms of co-operative marketing, or is still an "independent."

High Cost of Watching Other People Play

Concluded from page 6

continue them. The profits that the collegiate football season brings makes this continuance possible.

Besides football only one other college sport promises to become generally self-supporting and that is basket ball. In recent years college basket ball has come into public favor. Last year the crowds broke all records. If this increase continues basket ball will soon be a money maker in all colleges of any size and consequence athletically.

College rowing, boxing, wrestling, fencing, skating, hockey, swimming and soccer teams are not self-supporting. Football makes it possible to continue them.

Take rowing as an example. It costs about $25,000 to put a varsity eight through a rowing season. In rowing, the money is all going out and none ever coming in. There is no "gate" at a rowing regatta although it requires a financial outlay to view these races. The spectator almost always travels by train to reach the scene of the regatta. Then he must spend money for launch hire or bring his own yacht to view the proceedings in style. A great many spectators bring their own yachts. Running a yacht is an expensive proposition, as all men who own them know.

Horse racing takes in many millions each year. Although forbidden by law in many states (referring to thoroughbred racing) it is still lawful in some states and there it flourishes. To have races you must have horses and race horses cost a great deal of money. To every "Man o' War" and "Morvich," bought for a small price and earning a fortune, there are a dozen racing animals that cost stupendous figures before they are even established as winning performers. No one is able to estimate the amount of money spent each year on race horses. But, it is a fact that millions are annually invested in horses that have proved their winning ability and those that promise some. And if the exact figures were ever known they would become insignificant beside the total amount spent by the public on horse racing. Several millions of dollars were paid at the gate to see the three match races in which Epinard, the French champion, opposed the pick of American thoroughbreds this year. Then, consider the total gate receipts at the Kentucky Derby each May.

In thoroughbred racing the gate receipts become a minor item. The big item is the gambling. Regardless of what the thoroughbred-racing propagandists try to tell you, this sport would die in a few days at any track where betting was prohibited—and actually prevented. Thoroughbred racing is, frankly speaking, a dull sport unless there is a personal interest and this is achieved by the making of a wager on the outcome.

The major harness circuit has not done so well in recent years. This organization, known as the Grand Circuit, devoted exclusively to harness racing, had a large following twenty years ago. Laws against bookmaking proved a severe blow to harness racing. The Grand Circuit had its strongest field of operations in Michigan but when that state decided that bets could no longer be made on races the Grand Circuit had to quit. Harness racing was supposed to exist on the interest the *sport itself* aroused, without the betting end to stimulate enthusiasm, but as soon as the Grand Circuit was asked to race without betting it could not continue (in Michigan at least) without a heavy loss.

Auto racing has its place in sports calling for big investments. There are a number of speedways in this country and each year sees a number of auto speed classics decided. Starting a car in a race is a costly proposition. It usually requires an outlay of about $10,000 for the car and many of them are good for a single race only. The leading auto race of the year is the 500-mile event at Indianapolis, generally run on Memorial Day. Here the receipts reach a staggering sum, but that is necessary. An enormous plant has to be kept up 364 days each year for the race on the 365th day and the prize list runs up into high figures. The enormous reward offered the drivers is what helps to bring the crowd. And the crowd comes from all parts of the country to view the event. It spends a few fine fortunes in railroad fares and traveling expenses other than the fares.

Long-distance races are held on speedways in the East, the Far South and on the Pacific Coast. Since not more than two races are held on a speedway each year (and rarely more than one) the imagination does not have to travel far to figure out what it costs to keep up these racing establishments. Many of the tracks are built of wood which makes the expense all the greater.

In speed-boat racing, as in rowing, the money all goes out and none comes in. There are no gate receipts at speed-boat racing. To build a speed boat costs a great deal of money. There are few men in the country whose yearly salary is as big as the cost of a speed craft, particularly a boat fast enough to get into the Gold Cup Regatta. There are several power-boat regattas in the North each year and a number in Florida during the winter months. All the figures of financial nature at these events appear on one side of the ledger.

Boxing is another sport that calls for a great deal of traveling. Whenever Jack Dempsey steps into the ring to defend his title the money spent in railroad fares is considerably larger than the money taken in at the gate, and with Dempsey defending his title the gate receipts must total more than $1,000,000 to enable the promoter to break even. The Dempsey demands are in excess of a king's ransom and he can ask for a half-million dollar guaranty with the same nonchalance that the corner druggist asks a dime for an ice cream cone.

At the present time boxing is permitted under certain regulations in most of the states. The total gate receipts reach high because the sport has a general appeal and few men miss an opportunity to see a good bout, or what promises to be one. If more matches promised to be good bouts the gate receipts of boxing would rival those of baseball and football but there are few good bouts. Still, the public continues coming, ever hoping.

Soccer, hockey, professional football, speed skating, professional basket ball, wrestling, billiards, exhibition golf matches, tennis, and other sports draw millions of the public money. The exact amount will never be known, but the United States annually pays several billion to watch others play.

A "Live Town" in the Sun-Scorched Orient

Concluded from page 9

and above all the song of the giant wheels make a lasting impression of weird music in the midst of the desert which stretches away on all sides to the distant mountains, save along the course of the Orontes.

The ancient citadel of Hamah is fallen to ruin but its site gives a wonderful view over the city itself and across the desert to the mountains beyond. The view is best seen near the sunset hour when the purple shadows creep from the lowlands up the sides of the mountains and finally to the tops where the sunlight still lingers, while all the desert is in shadow, and the lights begin to twinkle in the city below.

Hamah is noted for its silks. There are no large silk factories anywhere in Syria, their manufacture being done in the homes of the people. The quality of work here on the banks of the Orontes is noted throughout the country.

There is only one main business street in the city and here from early morning to late in the evening the traders sit, everlastingly smoking their water pipes which rest on the ground by their feet, and drinking cup after cup of black coffee. Camels wander along bringing the products of farm and orchard, and dogs are underfoot everywhere. The traders in produce do their business early in the morning and about the time an American business man is thinking of starting the day these men have finished and give the rest of the day to smoke, coffee and meditation.

At Hamah, General Gouraud joined us for the trip through the land of the Alaouites, among the most interesting people of all Syria, over a new road built by French engineers.

The motors were again with us and we started for the mountains early in the morning.

Selling a State on the Merits of Its Products

Oregon Owes Much to Judicious Publicity System

HERBERT CUTHBERT,

Originator of the new and novel plan of developing, improving and settling up a state, not on its size, area, climate, scenery or opportunities, but on the merit of the agricultural and manufactured products it already puts out. He is an official of the Portland Chamber of Commerce.

By HARRY H. DUNN

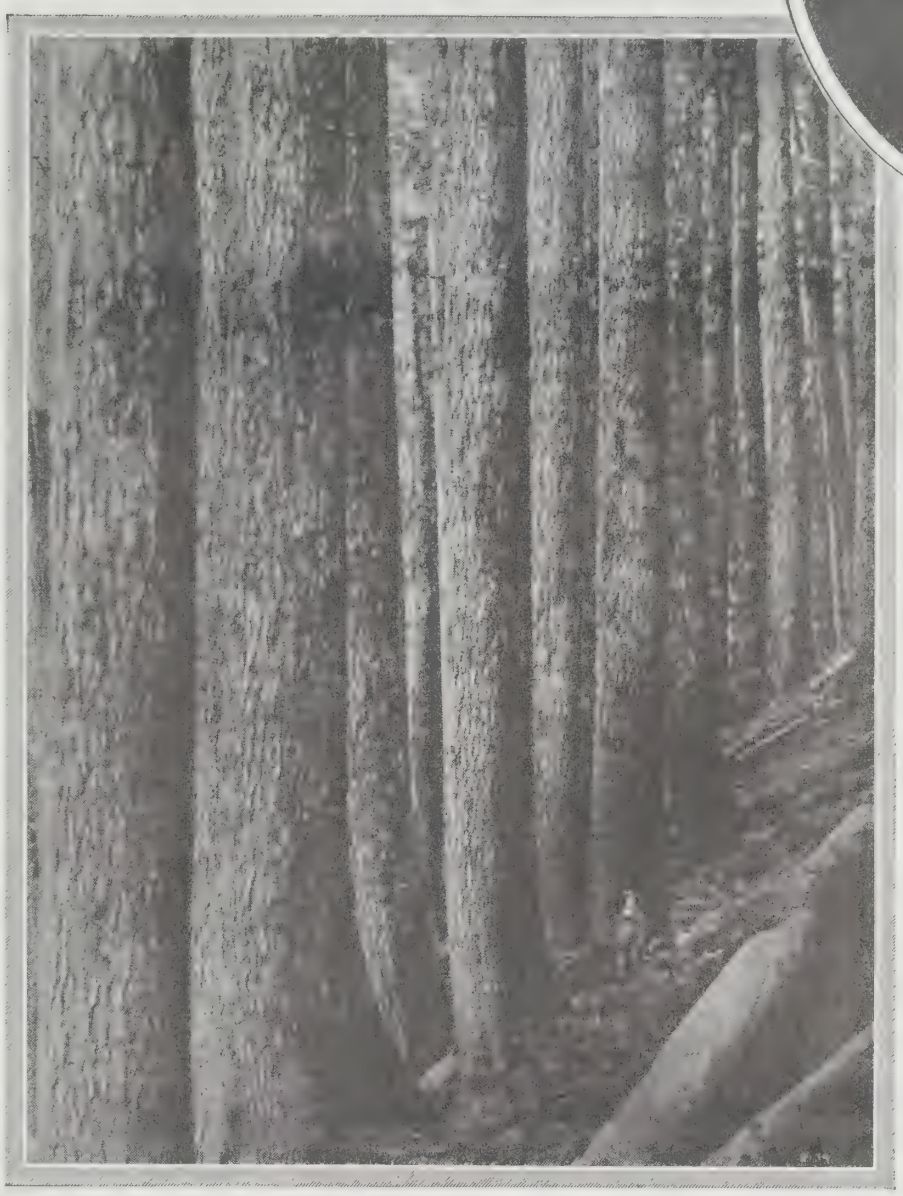
MANY of the states west of the Mississippi River, and a majority of those west of the Rocky Mountains, have been developed from the wilderness by advertising of one kind or another. At least one state on the Pacific Coast owes its present standing and population almost entirely to the publicity given it by carefully conducted advertising campaigns. Climate, scenery, possibilities, opportunities, all these have been drawn on —sometimes overdrawn—to attract men and women to become inhabitants of these western commonwealths. Now, however, comes a state, one whose population is still less than that of any one of several American cities, with a new plan for its own advancement, and for the development of its industries.

Instead of trying to bring new capital and fresh immigration, which, when brought in large numbers to a state, has worked more harm than good, this state plans to develop its own industries, to sell the products of those industries on a basis of merit, only, and to induce all these industries to make their products standard in the lines they represent. That is to say, the attention of the publicity and development powers within that state are to be devoted to the advancement, improvement, and development of the resources of that state through the expansion of the industries already established there, and through the wise use of the capital already invested there. Instead of devoting all the advertising funds and all the publicity opportunities to bringing in new capital and establishing new industries, these forces will be put behind those industries already functioning there.

The state is Oregon, probably the most nearly an original American state, still largely in the pioneer stage, of any in the Union. The system of developing the state first and looking for immigration afterward, is based on an idea which originated in the mind of Herbert Cuthbert, an official of the Portland Chamber of Commerce. As far as the writer knows, it is unique among methods of state or city development, and it is worthy of study, especially by those states which must depend for their advancement upon their resources and their industries, and not upon their possibilities as national playgrounds.

The idea is simple, as are most ideas which give large results. It comprehends, in brief, a combination of the forces within the state to obtain the widest distribution and sale of the products already produced there, by methods based entirely on the *merit* of each product. The result of this will be to increase the production of these established plants, and thereby augment the wealth of the state; and, eventually, to induce the people of Oregon themselves to start new industries and invest their money, their time and their abilities in them. The theory, which seems sound, is that to the people of the state belong the resources, the industries, the products, and the opportunities of that state.

There is no intention to bar outside capital; an abundance of that will come in when the successful operation of the "home-grown" industries is demonstrated. There is no thought of keeping out immigration, but it is hoped that at least a measure of *selective* immigration will be possible, and that a better grade of immigrants will be the result. Oregon is peopled today in large part by American-born Americans, men and women whose immediate ancestors made early America into the United States. It is that kind of people that the Oregonians want to keep coming to their fir-clad mountains, their stream-filled valleys, and their fertile slopes shading gradually into the Pacific Ocean.



There is more standing timber in Oregon than in any other state in the Union, according to the lumber experts of that section. Note the comparative size of the full-grown man standing at the base of one of these splendid trees.

"The idea first came to me when I read Napoleon's reported saying that 'the British are a nation of shopkeepers,'" said Mr. Cuthbert to me in Portland, the other day. "If Napoleon ever said this, he told the truth, but only half the truth, for this shopkeeping made wholesalers necessary. The wholesalers demanded manufacturers. The manufacturers demanded raw materials, and the need for raw materials developed the sea commerce of England. Every man who made anything in England in the days of Napoleon, made it the best thing of its kind that he possibly could. He did this because his consumers were local, neighbors to him, and if what he made was not of the best, his neighbors not only would cease to buy from him, but they would inform him, in no uncertain terms, of their opinion of his work. Thus it came about that, when there was a development in the manufacture of an article, it was an advancement toward the making of a better article, toward increasing the *merit* of the article produced.

"Today, as soon as the manufacturer in the United States finds that he has an article which sells readily, he immediately goes about, not to increase the merit of that article, but to find some means whereby he may reduce the cost, so that he can sell it cheaper, and make more money. In so reducing the cost of production, unless he has great industrial genius, the manufacturer, nine times out of ten, also reduces the quality of the article. Instead of building up to *merit*, he is building down to mediocrity.

"Now, then, following the precedent of the British shopkeeper who caused the upbuilding of England's commerce, the Oregon plan insists on the *merit* of the thing produced remaining at the highest standard, regardless of the *cost* of production. It demands that the productions of Oregon's industries, both agricultural and manufacturing, be sold to the consumers of the world only on the basis of that merit.

"In order to accomplish this we must first obtain—and we are getting it in full measure—the co-operation of every industry, both agricultural and manufacturing, in the production and sale of its product on this merit basis, first at home in Oregon, and, thereafter, in outside markets. We must drop this idea, prevalent to the exclusion of all others that 'investments,' 'pay rolls,' and 'population' are the only factors in the development of a section of this country.

"The development of our own already established industries will be such that the product of each is distinctive and attractive, yet so put out that it will draw attention to all of Oregon, and not merely to the section in which it is produced. In this effort we are getting the co-operation of every manufacturer. All goods of the same kind, whether manufactured or grown, are to be of the same grade of merit for each class, though there may and probably will be many classes of each product. All goods will be manufactured exactly as if they were all for home consumption right here among the neighbors of the manufacturers.

"By this method, if we can bring all the producers of the state to adhere to it, and it seems probable that we can, we shall obtain the widest and most favorable publicity for Oregon, and, through this, a class of immigrants, and permanent residents, which we believe will be better than those who might be attracted to the last frontier in America by different and more lurid forms of advertising."

Oregon is one of the leading wool-producing states of the Union. In fact, the ancient industry of growing wool and making clothing from it is being revived there to a greater extent than in any other state.

BRIEFLY TOLD

Cocain has been manufactured artificially by chemical means in the laboratory of a Berlin professor.

Canada exercised its full treaty-making rights for the first time recently when a commercial compact with Belgium was signed at Laurier House, Ottawa.

The United States Government plans to issue 50,000,000 pamphlets on the growing menace of heroin addiction among the school children of the country.

"It is perhaps a far cry from answering the endless questions of a child to the clanging of the big gates of Sing Sing and yet the two are related. From 70 to 80 per cent of the criminals come from unsympathetic homes. There is no greater preventive for wrongdoing than a great desire on the part of parents to understand their children, to pay attention to them and become their confidants."—*Rev. William E. Cashin,* Roman Catholic chaplain at Sing Sing.

The control of newspaper distribution in New York City is under the control of Morris Eisenman, Meyer Rosen, Joseph Kalmanoff and Louis Weinstock.

The Benning National Forest near Columbus, Georgia, has just been added to the list of new forest preserves of the United States. The new forest covers about 78,500 acres and has an excellent stand of southern pine timber.

An underground river passing under Mont Blanc has recently been discovered. The river, which has been named the Eauxbelles, contains many beautiful cascades and grottoes, and is believed to be the source of the Seine and the many rivers flowing through Germany, Switzerland and Austria.

Mrs. Johanna Smith, a citizen of Johannesburg, South Africa, who is 88 years old, has never seen a motion picture show, used a telephone, ridden in an automobile nor eaten ice cream.

The Romans were the originators of the Christmas tree, though their ceremony had little to do with the modern idea of the Christmas spirit. They began by hanging small masks of Bacchus, the god of wine, upon the grape vines in the belief that the spot would become unusually fruitful. The occasion was made one of merrymaking and dissipation. After the advent of Christianity it was converted into the Christmas-tree celebration.

The Malays of today are still using the water clock to tell time. This apparatus, which has been in use in the Far East for the past 5,000 years, is simply a small bowl with a hole in the bottom. When this is placed in a tub of water it will sink, the action always taking the same amount of time.

"For Sale—A Prison," is the odd advertisement which appeared in the newspaper of the town of Meckamburg, Switzerland. The jail has been empty for many years and the officials have decided to sell it and save the money of its upkeep.

Esperanto, "the universal language," has been officially placed in the curriculum of the public schools of Hungary.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The Ukraine Government has set aside as a Jewish reservation 8,000,000 acres in the district of Ekaterinoslav. Three thousand Jewish families are expected to settle on the reservation and an American commission has advanced a loan of $100,000 for the improvement of the land.

General Butler of the Marines has warned the police traffic squad of Philadelphia against swearing.

The demand for snakes for medicinal purposes in Japan is so large that the most famous snake-catcher in Tokio declares the annual consumption to be between four and five million for the country as a whole. Eighty per cent of the reptiles are charred and powdered, or else dried and made into capsules and pills.

The first tin can was inspired by Napoleon Bonaparte who offered a prize of 12,000 francs to anyone who would invent a way of preserving perishable vegetables for his mariners to eat on their long voyages. In 1809 the money was handed over to Nicolas Appert, an uneducated pickler who discovered that cooking foods in hermetically sealed containers made it possible to keep them indefinitely.

A subtropical valley in Northern British Columbia, just south of the Yukon Territory border, is to be colonized next year by wealthy mining men, according to reports.

The United States produces $300,000,000 worth of sole leather annually. It produces $75,000,000 worth of leather belting annually—these in addition to millions of dollars' worth of other classes of leather.

The highest radio telephone station in the world has been opened at the observatory on the Pic du Midi, France, about 10,000 feet above sea level.

On the recommendation of the Secretary of State naturalization certificate fees in Canada have advanced from $3 to $5.

The word "fiasco," meaning a failure, was originally an Italian word meaning flask. Venetian glass blowers, who were keen craftsmen, often detected a small flaw in their handiwork. They then turned the object into a fiasco, or flask, and so the word came to be applied to any failure.

Valuable islands in Lake Worth near West Palm Beach, Florida, are the subject of lawsuits between the state and federal governments. Both parties to the litigation claim valuable property rights, the decision hinging on whether or not the islands were in existence when Florida was admitted as a state or have since been built of silt.

Coxswain means the swain, or fellow, as we should say, in charge of a cogge, which was an old name for a boat. The name cogge became cock and came to mean the small boat. This was known as the cockboat, meaning a ship's small boat.

Although science knows the chief substances of honey and the proportion used by the bees, it is unable to equal the bee in the production of a delectable honey.

Geniuses often come from large families; Napoleon was an eighth child, Benjamin Franklin was the youngest of seventeen children, Wagner and Mozart were both seventh children, and Balzac was the youngest of a long line.

Florence Nightingale's lover, John Smithhurst, is buried at Elora, Ontario. He was a clergyman and cousin, and to separate the pair Florence was sent abroad against her will. During her exile she took up nursing and never again saw Smithhurst, who emigrated to Canada, dying at Elora, in 1867.

Bankers have estimated that more than 400 million dollars is hidden away in houses and similar hiding places by people who are afraid to trust banks. But in spite of this, for every dollar hoarded forty-six dollars is banked.

The Pan-American countries are planning to erect a lighthouse in the harbor of Santo Domingo, the city Columbus loved so well, which will serve as a tomb for the great discoverer. The lighthouse will be 1,000 feet high and will act as a guide for ships at sea.

A British Museum scientist who has been excavating the foundations of Richborough Castle, the Fort Rutupise of the Romans in England, declares that the old Romans were quite modern in their methods of dentistry and that they used gold fillings.

Ismael Bedard, a resident of Charlesbourg, Quebec County, Canada, claims the honor for his family of having lived longer in one place than any other family of North America. His ancestors have held the land without interruption since 1629, and the house in which he lives at the present time is believed to be the one erected at that date.

According to legend, the American Indian received corn directly from the hand of the Creator. The story goes that a young brave, who was looking for a gift that would help his people, hid himself in the forest for seven days. During this time he encountered a spirit whom he killed, and it was from this spirit's grave that a plant which bore the plumes of the unknown visitor sprang. Thus we have Mandamin or the Spirit's grain.

America has more than twenty-two million telephones in use, or more than the rest of the world combined. There are more telephones in New York than in Great Britain and the North of Ireland, and more in Chicago than all of France.

Scrooge Spends Christmas With Tiny Tim

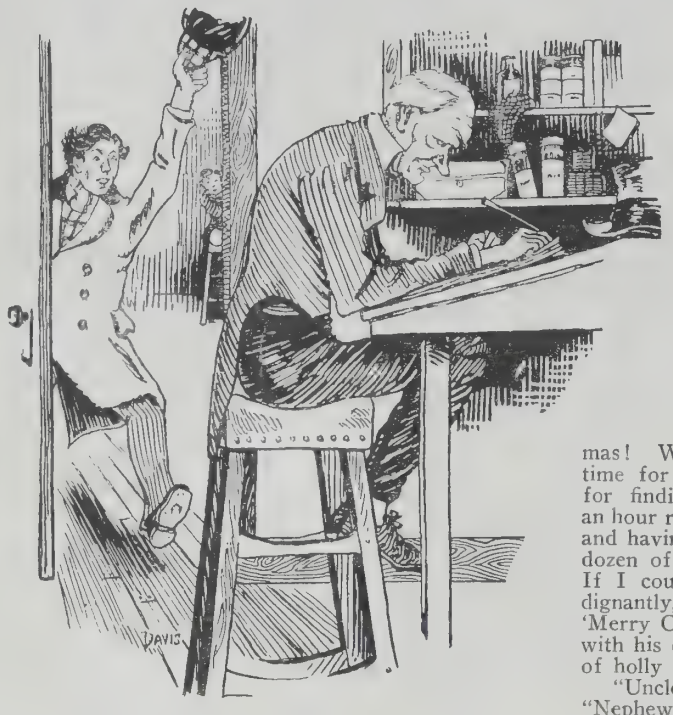
From "A Christmas Carol"—By CHARLES DICKENS



ONCE upon a time—of all the good days in the year, on Christmas Eve—old Scrooge sat busy in his counting-house. It was cold, bleak, biting weather: foggy withal: and he could hear the people in the court outside, go wheezing up and down, beating their hands upon their breasts, and stamping their feet upon the pavement stones to warm them. The city clocks had only just gone three, but it was quite dark already—it had not been light all day—and candles were flaring in the windows of the neighboring offices, like ruddy smears upon the palpable brown air. The fog came pouring in at every chink and keyhole, and was so dense without, that although the court was of the narrowest, the houses opposite were mere phantoms. To see the dingy cloud come drooping down, obscuring everything, one might have thought that Nature lived hard by, and was brewing on a large scale.

The door of Scrooge's counting-house was open that he might keep his eye upon his clerk, who in a dismal little cell beyond, a sort of tank, was copying letters. Scrooge had a very small fire, but the clerk's fire was so very much smaller that it looked like one coal. But he couldn't replenish it, for Scrooge kept the coal-box in his own room; and so surely as the clerk came in with the shovel, the master predicted that it would be necessary for them to part. Wherefore the clerk put on his white comforter, and tried to warm himself at the candle; in which effort, not being a man of a strong imagination, he failed.

"A merry Christmas, uncle! God save you!" cried a cheerful voice. It was the voice of Scrooge's nephew, who came upon him so quickly that this was the first intimation he had of his approach.

"Bah!" said Scrooge, "Humbug!"

He had so heated himself with rapid walking in the fog and frost, this nephew of Scrooge's, that he was all in a glow; his face was ruddy and handsome; his eyes sparkled, and his breath smoked again.

"Christmas a humbug, uncle!" said Scrooge's nephew. "You don't mean that, I am sure?"

"I do," said Scrooge. "Merry Christmas! What right have you to be merry? What reason have you to be merry? You're poor enough."

"Come, then," returned the nephew gaily. "What right have you to be dismal? What reason have you to be morose? You're rich enough."

Scrooge having no better answer ready on the spur of the moment, said, "Bah!" again; and followed it up with "Humbug."

"Don't be cross, uncle!" said the nephew.

"What else can I be," returned the uncle, "when I live in such a world of fools as this? Merry Christmas! Out upon merry Christmas! What's Christmas time to you but a time for paying bills without money; a time for finding yourself a year older, but not an hour richer; a time for balancing your books and having every item in 'em through a round dozen of months presented dead against you? If I could work my will," said Scrooge indignantly, "every idiot who goes about with 'Merry Christmas' on his lips should be boiled with his own pudding, and buried with a stake of holly through his heart. He should!"

"Uncle!" pleaded the nephew.

"Nephew!" returned the uncle, sternly, "keep Christmas in your own way, and let me keep it in mine."

"Keep it!" repeated Scrooge's nephew. "But you don't keep it."

"Let me leave it alone, then," said Scrooge. "Much good may it do you! Much good it has ever done you!"

"There are many things from which I might have derived good, by which I have not profited, I dare say," returned the nephew. "Christmas among the rest. But I am sure I have always thought of Christmas time, when it has come round—apart from the veneration due to its sacred name and origin, if anything belonging to it can be apart from that—as a good time; a kind, forgiving, charitable, pleasant time; the only time I know of, in the long calendar of the year, when men and women seem by one consent to open their shut-up hearts freely, and to think of people below them as if they really were fellow-passengers to the grave, and not another race of creatures bound on other journeys. And therefore, uncle, though it has never put a scrap of gold or silver in my pocket, I believe it *has* done me good, and *will* do me good; and I say, God bless it!"

The clerk in the tank involuntarily applauded. Becoming immediately sensible of the impropriety, he poked the fire, and extinguished the last frail spark for ever.

"Let me hear another sound from *you*," said Scrooge, "and you'll keep your Christmas by losing your situation! You're quite a powerful speaker, sir," he added, turning to his nephew. "I wonder you don't go into Parliament."

"Don't be angry, uncle. Come! Dine with us tomorrow."

* * * *

"Good afternoon," said Scrooge.

"I am sorry, with all my heart, to find you so resolute. We have never had any quarrel, to which I have been a party. But I have made the trial in homage to Christmas, and I'll keep my Christmas humor to the last. So A Merry Christmas, uncle!"

"Good afternoon!" said Scrooge.

"And A Happy New Year!"

"Good afternoon!" said Scrooge.

His nephew left the room without an angry word, notwithstanding. He stopped at the outer door to bestow the greetings of the season on the clerk, who, cold as he was, was warmer than Scrooge; for he returned them cordially.

"There's another fellow," muttered Scrooge; who overheard him: "my clerk, with fifteen shillings a week, and a wife and family, talking about a merry Christmas. I'll retire to Bedlam."

* * * *

The Ghost stopped at a certain warehouse door, and asked Scrooge if he knew it.

"Know it!" said Scrooge. "Was I apprenticed here!" They went in. At sight of an old gentleman in a Welsh wig, sitting behind such a high desk, that if he had been two inches taller he must have knocked his head against the ceiling, Scrooge cried in great excitement:

"Why, it's old Fezziwig! Bless his heart; it's Fezziwig alive again!"

Old Fezziwig laid down his pen, and looked up at the clock, which pointed to the hour of seven. He rubbed his hands; adjusted his capacious waistcoat; laughed all over himself, from his shoes to his organ of benevolence; and called out in a comfortable, oily, rich, fat, jovial voice:

"Yo ho, there! Ebenezer! Dick!"

Scrooge's former self, now grown a young man, came briskly in, accompanied by his fellow-'prentice.

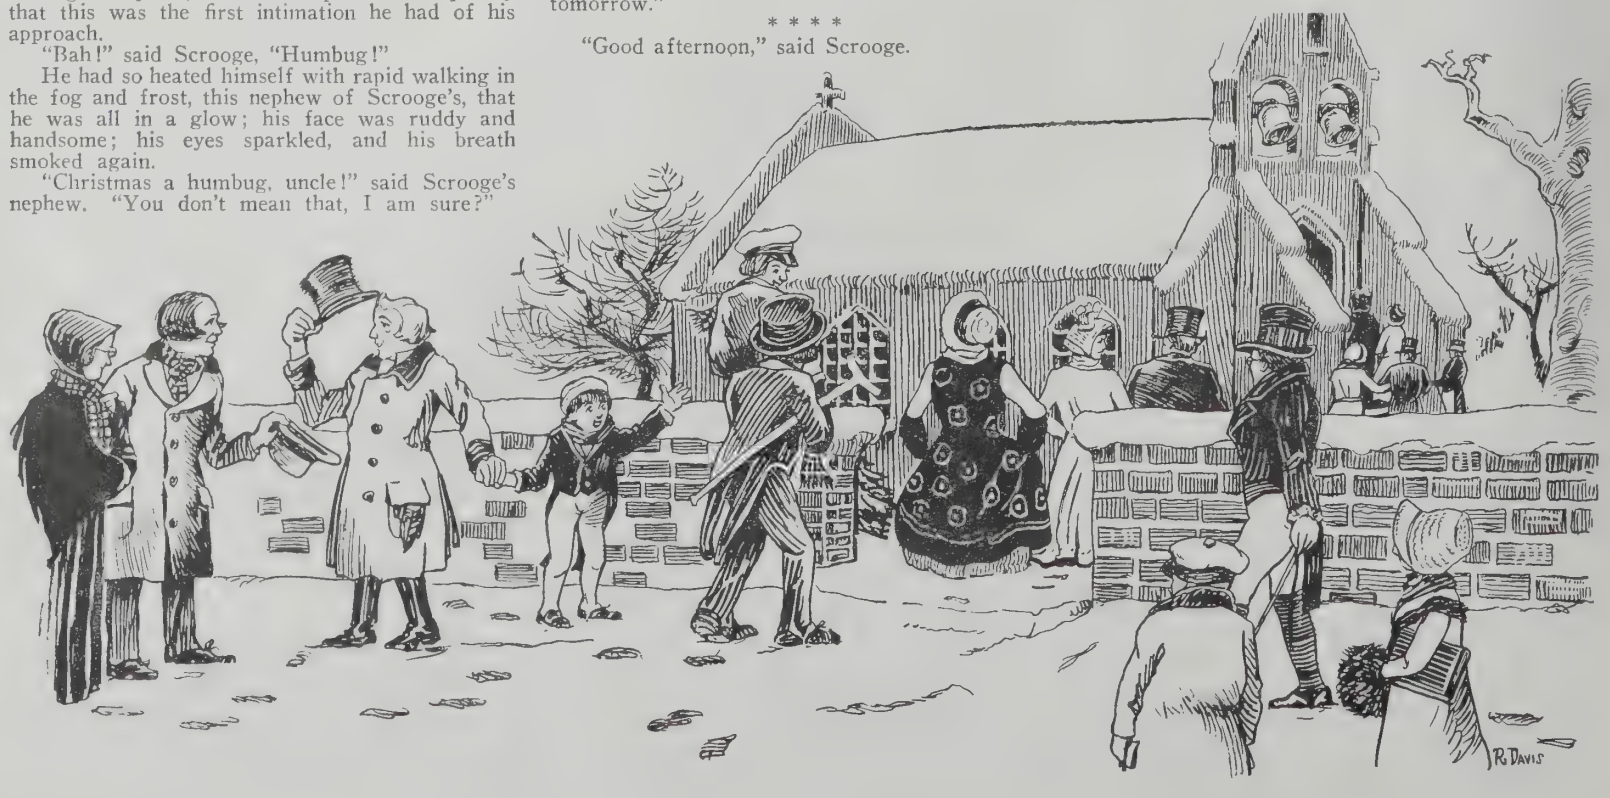
"Dick Wilkins, to be sure!" said Scrooge to the Ghost. "Bless me, yes. There he is. He was very much attached to me, was Dick. Poor Dick! Dear, dear!"

"Yo ho, my boys!" said Fezziwig. "No more work tonight. Christmas Eve, Dick. Christmas, Ebenezer! Let's have the shutters up," cried old Fezziwig, with a sharp clap of his hands, "before a man can say Jack Robinson!"

You wouldn't believe how those two fellows went at it! They charged into the street with the shutters—one, two, three—had 'em up in their places—four, five, six—barred 'em and pinned 'em—seven, eight, nine—and came back before you could have got to twelve, panting like race-horses.

"Hilli-ho!" cried old Fezziwig, skipping down from the high desk, with wonderful agility. "Clear away, my lads, and let's have lots of room here! Hilli-ho, Dick! Chirrup, Ebenezer!"

Clear away! There was nothing they wouldn't have cleared away, or couldn't have cleared away, with old Fezziwig looking on. It was done in a minute. Every movable was packed off, as if it were dismissed from public life for evermore; the floor was swept and watered, the lamps were trimmed, fuel was heaped upon the fire; and the warehouse was as snug, and warm, and dry, and bright a ball-room, as you would desire to see upon a winter's night.



In came a fiddler with a music-book, and went up to the lofty desk, and made an orchestra of it, and tuned like fifty stomach-aches. In came Mrs. Fezziwig, one vast substantial smile. In came the three Miss Fezziwigs, beaming and lovable. In came the six young followers whose hearts they broke. In came all the young men and women employed in the business. In came the housemaid, with her cousin, the baker. In came the cook, with her brother's particular friend, the milkman. In came the boy from over the way, who was suspected of not having board enough from his master; trying to hide himself behind the girl from next door but one, who was proved to have had her ears pulled by her mistress. In they all came, one after another; some shyly, some boldly, some gracefully, some awkwardly, some pushing, some pulling; in they all came, anyhow and everyhow. Away they all went, twenty couple at once; hands half round and back again the other way; down the middle and up again; round and round in various stages of affectionate grouping; old top couple always turning up in the wrong place; new top couple starting off again, as soon as they got there; all top couples at last, and not a bottom one to help them! When this result was brought about, old Fezziwig, clapping his hands to stop the dance, cried out, "Well done!" and the fiddler plunged his hot face into a pot of porter, especially provided for that purpose. But scorning rest, upon his reappearance, he instantly began again, though there were no dancers yet, as if the other fiddler had been carried home, exhausted, on a shutter, and he were a bran-new man resolved to beat him out of sight, or perish.

There were more dances, and there were forfeits, and more dances, and there was cake, and there was negus, and there was a great piece of Cold Roast, and there was a great piece of Cold Boiled, and there were mince-pies, and plenty of beer. But the great effect of the evening came after the Roast and Boiled, when the fiddler (an artful dog, mind! The sort of man who knew his business better than you or I could have told it him!) struck up "Sir Roger de Coverley." Then old Fezziwig stood out to dance with Mrs. Fezziwig. Top couple, too; with a good stiff piece of work cut out for them; three or four and twenty pair of partners; people who were not to be trifled with; people who *would* dance, and had no notion of walking.

But if they had been twice as many—ah, four times—old Fezziwig would have been a match for them, and so would Mrs. Fezziwig. As to *her*, she was worthy to be his partner in every sense of the term. If that's not high praise, tell me higher, and I'll use it. A positive light appeared to issue from Fezziwig's calves. They shone in every part of the dance like moons. You couldn't have predicted, at any given time, what would have become of them next. And when old Fezziwig and Mrs. Fezziwig had gone all through the dance; advance and retire, both hands to your partner, bow and curtsey, corkscrew, thread-the-needle, and back again to your place; Fezziwig "cut"—cut so deftly, that he appeared to wink with his legs, and came upon his feet again without a stagger.

When the clock struck eleven, this domestic ball broke up. Mr. and Mrs. Fezziwig took their stations, one on either side of the door, and shaking hands with every person individually as he or she went out, wished him or her a Merry Christmas. When everybody had retired but the two 'prentices, they did the same to them; and thus the cheerful voices died away, and the lads were left to their beds; which were under a counter in the back-shop.

* * * *

It was his own room. There was no doubt about that. But it had undergone a surprising transformation. The walls and ceiling were so hung with living green, that it looked a perfect grove; from every part of which, bright gleaming berries glistened. The crisp leaves of holly, mistletoe, and ivy reflected back the light, as if so many little mirrors had been scattered there; and such a mighty blaze went roaring up the chimney, as that dull petrification of a hearth had never known in Scrooge's time, or Marley's, or for many and many a winter season gone. Heaped up on the floor, to form a kind of throne, were turkeys, geese, game, poultry, brawn, great joints of meat, sucking-pigs, long wreaths of sausages, mince-pies, plum-puddings, barrels of oysters, red-hot chestnuts, cherry-cheeked apples, juicy oranges, luscious pears, immense twelfth-cakes, and seething bowls of punch, that made the chamber dim with their delicious steam. In easy state upon this couch, there sat a jolly Giant, glorious to see; who bore a glowing torch, in shape not unlike Plenty's horn, and held it up, high up, to shed its light on Scrooge, as he came peeping round the door.

"Come in!" exclaimed the Ghost. "Come in! and know me better, man!"

Scrooge entered timidly, and hung his head before this Spirit. He was not the dogged Scrooge he had been; and though the Spirit's eyes were clear and kind, he did not like to meet them.

"I am the Ghost of Christmas Present," said the Spirit. "Look upon me!"

Scrooge reverently did so. It was clothed in one simple green robe, or mantle, bordered with white fur. This garment hung so loosely on the figure, that its capacious breast was bare, as if disdaining to be warded or concealed by any artifice. Its feet, observable beneath the ample folds of the garment, were also bare; and on its head it wore no other covering than a holly wreath, set here and there with shining icicles. Its dark brown curls were long and free; free as its genial face, its sparkling eye, its open hand, its cheery voice, its unconstrained demeanour, and its joyful air. Girded round its middle was an antique scabbard; but no sword was in it, and the ancient sheath was eaten up with rust.

"You have never seen the like of me before!" exclaimed the Spirit.

"Never," Scrooge made answer to it.

"Have never walked forth with the younger members of my family; meaning (for I am very young) my elder brothers born in these later years?" pursued the Phantom.

"I don't think I have," said Scrooge. "I am afraid I have not. Have you had many brothers, Spirit?"

"More than eighteen hundred," said the Ghost.

"A tremendous family to provide for!" muttered Scrooge. The Ghost of Christmas Present rose.

"Spirit," said Scrooge submissively, "conduct me where you will. I went forth last night on compulsion, and I learnt a lesson which is working now. Tonight, if you have ought to teach me, let me profit by it."

"Touch my robe!"

Scrooge did as he was told, and held it fast.

Holly, mistletoe, red berries, ivy, turkeys, geese, game, poultry, brawn, meat, pigs, sausages, oysters, pies, puddings, fruit and punch, all vanished instantly. So did the room, the fire, the ruddy glow, the hour of night, and they stood in the city streets on Christmas morning, where (for the weather was severe) the people made a rough, but brisk and not unpleasant kind of music, in scraping the snow from the pavement in front of their dwellings, and from the tops of their houses, whence it was mad delight to the boys to see it come plumping down into the road below, and splitting into artificial little snow-storms.

The house fronts looked black enough, and the windows blacker, contrasting with the smooth white sheet of snow upon the roofs, and with the dirtier snow upon the ground; which last deposit had been ploughed up in deep furrows by the heavy wheels of carts and waggons; furrows that crossed and re-crossed each other hundreds of times where the great streets branched off; and made intricate channels, hard to trace in the thick yellow mud and icy water. The sky was gloomy, and the shortest streets were choked up with a dingy mist, half thawed, half frozen, whose heavier particles descended in a shower of sooty atoms, as if all the chimneys in Great Britain had, by one consent, caught fire, and were blazing away to their dear hearts' content. There was nothing very cheerful in the climate or the town, and yet was there an air of cheerfulness abroad that the clearest summer air and brightest summer sun might have endeavored to diffuse in vain.

For the people who were shovelling away on the housetops were jovial and full of glee; calling out to one another from the parapets, and now and then exchanging a facetious snowball—better-natured missile far than many a wordy jest—laughing heartily if it went right and not less heartily if it went wrong. The poulterers' shops were still half open, and the fruiterers' were radiant in their glory. There were great, round, pot bellied baskets of chestnuts, shaped like the waistcoats of jolly old gentlemen, lolling at the doors, and tumbling out into the street in their apoplectic opulence. There were ruddy, brown-faced, broad-girthed Spanish Onions, shining in the fatness of their growth like Spanish Friars, and winking from their shelves in wanton slyness at the girls as they went by, and glanced demurely at the hung-up mistletoe. There were pears and apples, clustered high in blooming pyramids; there were bunches of grapes, made in the shopkeepers' benevolence to dangle from conspicuous hooks, that people's mouths might water gratis as they passed; there were piles of filberts, mossy and brown, recalling, in their fragrance, ancient walks among the woods, and pleasant shufflings ankle deep through withered leaves; there were Norfolk Biffins, squab and swarthy, setting off the yellow of the oranges and lemons, and, in the great compactness of their juicy persons, urgently entreating and beseeching to be carried home in paper bags and eaten after dinner. The very gold and silver fish, set forth among these choice fruits in a bowl, though members of a dull and stagnant-blooded race, appeared to know that there was something going on; and, to a fish, went gasping round and round their little world in slow and passionless excitement.

The Grocers'! oh the Grocers'! nearly closed, with perhaps two shutters down, or one; but through those gaps such glimpses! It was not alone that the scales descending on the counter made a merry sound, or that the twine and roller parted company so briskly, or that the canisters were rattled up and down like juggling tricks, or even that the blended scents of tea and coffee were so grateful to the nose, or even that the raisins were so plentiful and rare, the almonds so extremely white, the sticks of cinnamon so long and straight, the other spices so delicious, the candied fruits so caked and spotted with molten sugar as to make the coldest lookers-on feel faint and subsequently bilious Nor was it that the figs were moist and pulpy, or that the French plums blushed in modest tartness from their highly-decorated boxes, or that everything was good to eat and in its Christmas dress; but the customers were all so hurried and so eager in the hopeful promise of the day, that they tumbled up against each other at the door, crashing their wicker baskets wildly, and left their purchases upon the counter, and came running back to fetch them, and committed hundreds of the like mistakes, in the best humour possible; while the Grocer and his people were so frank and fresh that the polished hearts with which they fastened their aprons behind might have been their own, worn outside for general inspection, and for Christmas daws to peck at if they chose.

But soon the steeples called good people all, to church and chapel, and away they came, flocking through the streets in their best clothes, and with their gayest faces. And at the same time there emerged from scores of bye-streets, lanes, and nameless turnings, innumerable people, carrying their dinners to the bakers' shops. The sight of these poor revellers appeared to interest the Spirit very much, for he stood with Scrooge beside him in a baker's doorway, and taking off the covers as their bearers passed, sprinkled incense on their dinners from his torch. And it was a very uncommon kind of torch, for once or twice when there were angry words between some dinner-carriers who had jostled each other, he shed a few drops of water on them from it, and their good humor was restored directly. For they said, it was a shame to quarrel upon Christmas Day. And so it was! God love it, so it was!

In time the bells ceased, and the bakers were shut up; and yet there was a genial shadowing forth of all these dinners and the progress of their cooking, in the thawed blotch of wet above each baker's oven; where the pavement smoked as if its stones were cooking too.

"Is there a peculiar flavour in what you sprinkle from your torch?" asked Scrooge.

"There is. My own."

"Would it apply to any kind of dinner on this day?" asked Scrooge.

"To any kindly given. To a poor one most."

More About Elmer's Clan and the Muskrats

Elmer Discloses Some Secrets of the High Cost of Fashion Plate Furs

By MAX BENTLEY

The first installment of this article appeared last week.

THE night on which the trapping season ended, the rise in the river reached the lower Sabine. A late misty spring moon peeping over the swaying tops of the cypress trees saw the warm tide smoothly roll out over the coastal marshes of all that part of Southwestern Louisiana. It quickly covered the last upthrusting knob of high land on Honey Island, and drove Elmer Bowman and his extensive ménage out to the channel to seek a hang-up elsewhere, leaving disaster behind. They took me, their guest, along with them; we slid out to midstream to drift down the broad bosom of the river through the still night, without a single regret.

After a fashion, Honey Island is home to Elmer and his clan, by grace of squatter rights; but, as Elmer said to me, "Any old place is home whar I can fling a rope around a tree." The Elmer Bowmans are travelers. Judged by fur-trapper habits thereabouts they are downright cosmopolitans. Anywhere on the lower Sabine, along a stretch of 150 miles from Lofton Lake to the river's mouth, the Bowman houseboat fleet and its convoy of high-speed power boats, with the floating hog pen—and the hog—bringing up the rear, are likely to be seen, by day or night, gliding down the palmetto-fringed channel or chug-chugging upstream. This stretch of water is riotous with life—furred, finned and feathered—and yields a year-round living, and a good one, to the sixteen men, women, children and dogs making up the trapper colony over which presides the elderly, sinewy, shrewd, nature-wise Elmer himself.

A trapper's home in the Great Marsh, where the taking of fur-bearing mammals, especially muskrats, is productive of hundreds of thousands of dollars annually in value of the pelts

The rise on the Sabine had come down earlier than expected and caught the Bowmans unprepared: their traps lying here and there in confusion and their nets unstretched. The truth is, in thus neglecting the tools of his calling, Elmer had yielded to an unwonted impulse: high water had caught him patching up one of the two shanties on the island which give the place the legal semblance of a homestead. As a dwelling it left much to be desired, being rickety and having a positively ephemeral appearance, but it sufficed, and it was home. As Elmer expressed it, "The big oak had got doty and was about to die. I was afeard the water would break the tree and push the shanty down, and I sawed the tree and it fell on the shanty which leaned ag'in' the other shanty, and both of 'em slid in the water. We beat the rise to it."

Elmer took his newest loss with the same philosophical indifference. The subject was not again alluded to by the four men sitting around the oilcloth-covered table in the "living room" of the main house boat, over the crumbs of an abundant if late supper. A flickering oil lamp threw shadows grotesquely about the room, projecting on the far wall, with unearthly fidelity, every detail of Elmer's long and solemn countenance. Presently the moon slid behind a cloud. The trees moaned and the night became gusty. So we tied up on the Louisiana side at a point where cypress and tupelo gum and swamp maple trees stand straight and thick, undermining with their tangle of roots the low and precarious informal bank of the river. Their limbs brushed against roof and windows with a dolorous whishing sound. The steadily rising water gave the boat a pleasant rocking motion since it was supported on pontoons upturned at the ends like skis.

We had dined sumptuously on ribs of buffalo fish, crisp bacon frizzles and hot corn bread, topping it off with *demi-tasse* served in enormous cups, and caviar sandwiches, *à la* Bowman, spread thickly on slabs of cold biscuits. At city prices, we ate ten dollars' worth of that piquant palate teaser, but Elmer didn't mind: he makes the caviar himself, from the roe of the spoonbill catfish, and sells it in twenty-pound firkins to New York canners who broadcast it as "Genuine Russian Imported."

Just now we were listening to the radio, each of us having a headpiece.

"Kansas City announcing," said Elmer, breaking a strained silence. He clumped outside to give his aerial another twist around a convenient cypress limb. Kansas City was giving the weather forecast: "Clear and colder tomorrow. Cold wave to the Gulf Coast."

"Too bad! That means the rats will be running, and here's the season ending tonight. Them French *cajans* will cross to the Texas side when this snap hits, and make a clean-up," said Elmer. "I recollect last season when it was warm and wet and no rats stirring. The river was low; everything was just right but the weather. My darter was attemptin' to raise Pittsburgh for a violin solo or somethin', and she tuned in on Kansas City just as that fellow with the loud voice was sayin' the weather had dropped forty degrees and look out for a norther to the coast. My boy Robbie and me, and some of the others, shinned out that same night with two hundred traps while the other trappers was layin' cozy tied up to the bank in their shanties. Shore 'nough, the norther hit. We catched one-fifty—big, prime fellows—and sold 'em to Joe Pavell at Orange at four bits around.

"This radio is Lutcher Stark's idea over at Orange. He put it in, money bein' nothin' to him, and you can see what she does for us. She's a business getter because she gives us the jump on the other trappers. I don't know how much I don't owe that Kansas City weather fellow."

"The trapper's life," I volunteered, "is inexorably ruled by the weather."

Elmer acquiesced out of sheer politeness. "That and high prices," he assented. "High prices for fur is ruining the country. I've catched town boys in the marshes fiddlin' around with their new purty traps, bustin' their fingers, tryin' to pick up a skin or two for a dollar apiece when prices was high instead of working at the trade they was brought up at. I'd ruther trap rats any time for four bits than a dollar. Low fur keeps the amachoors out. In my time I've seen the rats move into this country by the million, over from the east side of Louisiana, with them *cajan* hogs right in behind them. They're still moving west. You won't find a hundred now on the Middle Texas coast, but wait a few years! By the time Robbie is my age there won't be a rat left here. They'll all be in Texas, still travelin' west, with the hogs pushing 'em on."

"What makes the high prices?" I asked.

"Them stinkin' fashion plates in New York," Elmer spoke bitterly. "It takes two hundred rat skins to make one of them Hudson sealskin coats, and they won't buy 'em under a thousand dollars. Ask three hundred for 'em and they'd spit on you. The fur companies holler about too much trapping and then turn around and put two hundred rat skins in one coat."

"But Elmer, the fur companies don't make the coats."

"It's all the same. The whole bunch are in cahoots," he insisted. "I get four bits for a prime rat skin, thirty-five cents for a possum, a dollar for a skunk, two-fifty for a good coon, four and a quarter for a mink, and fifteen to thirty dollars for an otter. *That's* my velvet; you don't catch more than two a season of them. If I trap on leased land I pay my regular buyer ten to twenty-five cents for the right to work on land he has leased up. Two hundred skins is a big run, even for me with all this menagerie to help, and it goes into one coat. We work like dogs—for *them*."

The bread-winners of the Bowman hunter-fisher-trapper clan. Left to right—"Mister" Larison, and Robbie, Homer and Elmer Bowman.

There was more of truth than poetry in what Elmer said. On the consuming end of the trapping industry one hundred, and even two hundred, rat skins will go into one coat and be sold for mole or mink, or electric seal, Hudson seal, Red River seal, and many other kinds of "seal"—none of which exist. The three-pound muskrat whose fur brought Elmer Bowman 50 cents, if it was prime fur, was auctioned by the dealer at $1.75 to $2.25. His $1 skunk skin drew $5 at auction, his $2.50 coon skin $6, his $4 mink skin up to $10, while his $15 to $30 "velvet," picked up on an occasional wandering otter, commanded at auction up to $50. In due time, if Elmer were a buyer of fur garments, his rat, sheared, would come back to him either as rat or seal, mink or mole. His mink, blended, might return as sable, or, unhaired and dyed, as seal; his coon, dyed, as lynx; his possum, blended, as marten.

Those are little byplays of the trade of which Elmer, being only a trapper, rightly should know little and yet knows much. Trade names have been adopted for dyed and manipulated skins; and since responsible dealers readily enough take their customers into their confidence, even to coaching them on how to identify for themselves the various grades of fur falling under one common or trade name, the practice is apparently not open to serious criticism except as it may be found that "group" furs are offered at prices in excess of the value of the original species making up the group. As, alas! it has been so found from time to time.

For example, during the fur extravaganza and post-war spending orgy of 1919-20 it was no secret that even the gentle house cat was appearing on the fur market as the *genet*, even as the prairie dog and woodchuck were sold as mink. On the other hand, as related by William T. Hornaday, of the New York Zoological Society, the society purchased for $1,250 a living specimen of the Australian koala, or native "bear," only to have it speedily languish away in captivity. Its passing might have been expected, since only two have lived for any considerable time after their exportation to North America. "The koala," says Mr. Hornaday, "is one of the most interesting of the many bizarre and remarkable animals of Australia. It is a tree dweller, and feeds on the leaves of the eucalyptus." Australian trappers have set out to exterminate the species, and its skin has appeared on the American market under the trade name *wombat*, at destructively low prices ranging from 70 cents to $1.50.

As for tabby, after all there is no fur of a softer texture and luster than hers, especially if she claims Persia or Malta as her ancestral home; so that if *genet* went over big (whereas *tomcat* or even *felis domestica* would never do), undoubtedly there were many satisfied customers.

With more dignity, but with nothing yielded of positiveness, Elmer Bowman's indictment of "them stinkin' fashion plates" is seconded in high circles, by conservationists and fur dealers alike. Mr. Hornaday, besides predicting total extinction of the fur-bearing animals within twenty years, scornfully pays his respects to the New York gallant in evening dress "who rides in a tightly closed limousine from hotel to theater and ball, wearing a fur-lined overcoat which is as necessary to his comfort as a caribou-lined sleeping bag would be in the Waldorf-Astoria." In New York, Mr. Hornaday notes, "an object of commiseration is the man with the fur-lined overcoat riding in the subway, bravely trying to bear up under the burden of unnecessary fur. If the amazing high prices for fur that prevailed in the winter of 1919-20 had held for five years, the fur question would have answered itself in the extermination of all species of fur-bearing animals. Thanks to the long and hard fall in prices that has given the market a terrific jolt, the fur bearers may be about twenty years in reaching extinction.

"The world's final frantic struggle for fur brings to mind Professor Henry Fairfield Osborn's masterful book, 'The Age of Mammals.' It reviews and throws upon the screen the developments of the world's most interesting geological period, following the Age of Reptiles and the passing of the dinosaurs. Viewing with the eyes of a biologist the war of extermination being waged on the fur-bearing species, and the destruction of wild animals for sport, Professor Osborn declares that 'The last chapter of the Age of Mammals now is being written in blood, and the end of the period of mammalian life is at hand.'

"We would like to think that the mammalian species living and thriving today will go on and on, changing and progressing according to their circumstances, for another million years, but all such dreams and hopes are vain and illusory. We are witnessing the extinguishment of the world's grandest group of vertebrates: the class Mammalia. The great tragedy is proceeding on plain and mountain, in forest and field, on lake shore and seacoast, in swamp and desert, and in the sea. Even under the surface of Mother Earth it is relentlessly moving on, and not even the subterranean mole is secure.

"The fur trapper has his legitimate place in the economy of Nature. We believe in fur in moderation just as we do in the Constitution of the United States, minus some of its amendments, but the death rate of fur bearers a garment and the great quantities of fur wasted, implicating alike men, women and children—and even the cradled babe—show the extent to which we are guilty of participating in a war of extinction."

The pride-bearing woman engulfed in her full-length coat of Hudson seal, stepping mincingly along the

Seeing Paris—More American Impressions

Some Vivid Visions of Versailles—A Place of Extravagance, Not Luxury

By ALLAN L. BENSON

THE Champs Élysées is the most beautiful street I ever saw. It is about three times as wide as Fifth Avenue in New York, sweeps gracefully up the gentle ascent that begins at the Place de la Concorde and extends a half-mile to the Arc de Triomphe. It is hedged in on each side by a wonderful growth of huge horse-chestnut trees and the buildings are of uniform height—about five stories. The pavement is asphalt.

The Place de la Concorde is the gem of all I have ever seen in municipal planning. Imagine a square tract of land, the equivalent of perhaps ten large city blocks, set down on the banks of the Seine. Around it are eight huge marble statues of seated women, representing eight cities of France. The statues are mounted on broad pedestals perhaps ten feet high. It was the statue representing Strassburg that was shrouded in crêpe from 1870 until the French recovered Strassburg after the Great War.

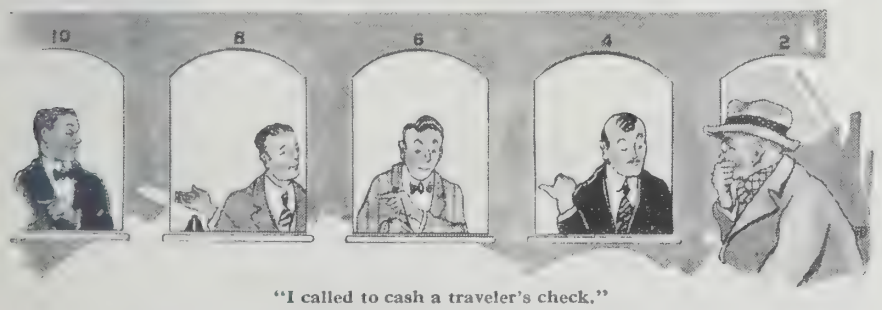
This whole great area is paved with asphalt. In the center is a pink obelisk perhaps sixty feet high that some African ruler gave to a French king 80 years ago. On either side of the obelisk, at a little distance, is a fountain, ornamented with the best bronzes that French art could fashion. The obelisk and the fountains are set in a line that marks a central driveway through the square, ending at the Seine. And just over the Seine is the old Bourbon palace, looking like a Roman temple, that is now the Chamber of Deputies. The palace, built long before the Place de la Concorde was ever thought of, looks as if it were the keystone of it. And over, a little distance to the right, is the Eiffel Tower, looking like a beautiful bit of lace draped down from a cloud. I saw the new moon hanging low toward the horizon as if some one in the tower had hung it out.

Historical recollections as well as beauty cluster about the Place de la Concorde. Where the pink obelisk now stands, Louis XVI was guillotined. During the French Revolution this great square was the slaughter-house of the revolutionists. Two thousand heads fell into the basket. Now fountains play and traffic swirls through what was once a sea of blood. Swirls is the word. While one is dodging one automobile, three others bear down upon him until death seems certain. I never saw anyone hurt, but I never passed through the Concorde that I did not wonder how I came through alive.

Napoleon's ashes lie under a great gilded dome that is the central part of what is known as the Hotel des Invalides. The adjoining buildings were once used as a military hospital; now they are a military museum. In the courtyard is the railway coach in which Marshal Foch received the surrender of the Germans in November, 1918. It is a steel car and will last long. One can imagine visitors to Paris, a thousand years hence, viewing this car with awe. It has become and will long remain one of the great historic properties of the world.

You go into the great circular room under the golden dome and look down through a circular, railed opening in the stone floor to the sarcophagus that contains the ashes of Napoleon. The sarcophagus, beautifully fashioned in sweeping, graceful curves, is made of a lustrous, reddish-brown marble from Finland, the gift of a czar who reigned in Russia 80 years ago. In a circle, around the sarcophagus are twelve statues representing angels. Each angel stands for one of Napoleon's battles.

Probably every one who ever visited Napoleon's tomb had a set of thoughts, created by the scene, that was peculiar to himself. I thought, first, of the restless soul who had shed so much human blood, now unable to shed any more. It seemed out of place that a dozen angels should be standing around, apparently in grief at his going, until it occurred to me that the angels were of stone and couldn't get out of the place if they wanted to. I thought of the splendor of Napoleon's tomb—which is beyond description—and then my mind turned to the simple little brick structure that houses the remains of George Washington. I thought of the procession, from the ends of the earth, that has been coming to Napoleon's tomb since his body was put into it about 80 years ago—and which will keep coming perhaps for many centuries. General Grant had stood there and looked down upon the great block of red marble. I also thought of another American whom a French guide tried to impress, with unexpected results. Told by the guide that the lid of the sarcophagus weighed ten tons or so, the American replied: "Well, that ought to hold him, but if he gets away, cable me at my expense."



"I called to cash a traveler's check."

I visited the palace at Versailles which John D. Rockefeller has given orders to repair at his expense. It needs it. The place is run down, out of repair and generally in bad order. Versailles has been so well advertised that I expected to see something that would make me gasp. I gasped but not at its beauty.

The first thing to remember about the palace and gardens of Versailles is that they cost $500,000,000 and the unpaid labor of 36,000 men during a long period of years. They were supposed to constitute the last word in luxury. They do nothing of the kind. There are plenty of places on Long Island that can discount it as places of luxury. Versailles is a place of extravagance, not of luxury. Louis XIV did not know what luxury meant. His Hall of Mirrors, where William I was crowned German Emperor, and where the peace treaty was signed at the close of the Great War, is anything but the gorgeous place that I had supposed it to be. It has a lot of mirrors in it, but so has the Grand Central barber shop. Its length, width and height are the only impressive things I could see about it. Louis XIV picked out a pretty good room for himself, and the bed upon which he slept is made up as if he were coming back to sleep in it tonight, but his queen, Maria Theresa, had a small suite of inside rooms that no one could now rent as a Harlem flat. The whole place is almost as bare of furnishings as an empty freight car, but one can imagine that these great rooms were pretty gorgeous when they were occupied.

The drunkest man I ever saw was trying, the day I was at Versailles, to flatten out these paving blocks with his head. Bystanders would pick him up, set him on his feet, gently remove their hands from his arms, and he would reel about three steps and come down like a falling chimney. I never saw anybody fall so fast and so hard. I was glad to note that he was not an American. He was French. Light wines and beer had not kept him sober.

Another picture comes to me from Versailles. As I was passing through the grounds, one beautiful Sunday morning, I saw a girl sitting on a French soldier's lap, throwing her arms about his neck, kissing him again and again, entirely oblivious of myself and others who were passing by. The girl was apparently about 18 years old and the soldier perhaps a year or two older. While she was throwing her arms about him and kissing him first on one cheek and then on the other, he looked at us, with sort of an Eddie Foy grin on his face. But in Paris kissing in public is quite common. Young men and women kiss on the street the same as we in America shake hands, and once in a while men smack each other.

I also visited the Grand Trianon, a marble palace that Louis XIV built for Maria Theresa. It is a one-story marble building, now turned yellow. Everything in France that rents for more than $35 a month is apparently called a palace. In the Grand Trianon I saw the bed upon which Napoleon slept when he was Emperor and also an eight-foot table, the top of which was made from a single board of a tree, from which Louis XIV and Maria Theresa used to dine.

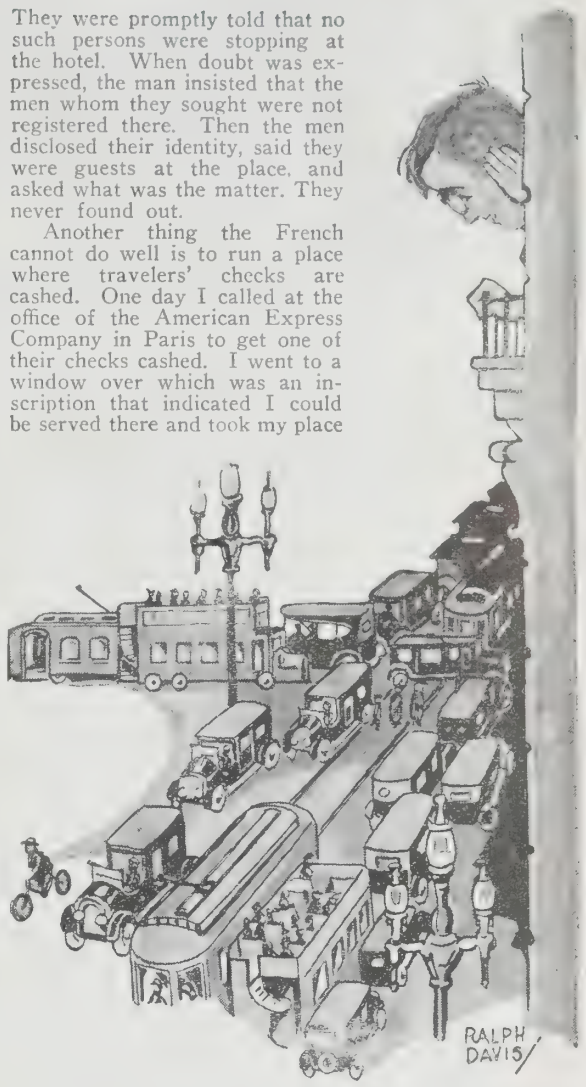
The Louvre is France's great art gallery—a place about which everybody raves. It is fashionable to rave about the Louvre. The more one raves about it the easier it is to conceal the fact that he has only a dim notion of what it is all about. I am frank to say that I went through the place like a fire engine answering a third alarm. I saw a lot that interested me and a lot that didn't. Some of the old masters got my goat. They knew how to get their effects, but what subjects they sometimes chose. What is the use of filling a twenty-foot frame with two-year-old angels, flying around like so many mosquitoes?

The French do so many things well that it is surprising they do some other things so poorly. They do not know how to regulate traffic in the city streets. I suppose the reason for this goes back to the French disinclination to take orders curtailing their personal liberty. Paris policemen are, therefore, jokes, because nobody pays much attention to them. Sometimes a policeman holds out his arm, or a short stick, to hold back the crowd while motors are passing, but the first Frenchman who comes along may push down the cop's arm or stick and walk on; or he may hang his hat on the officer's stick for a moment, to show his good-natured contempt for his authority, and walk on. Half the time the policemen, who travel in pairs, make no attempt to control traffic. I have seen them standing on the curb talking while pedestrians and motors were mixing themselves up in a busy street.

According to American understanding, the French do not know how to run hotels or office buildings. In most of the office buildings, you walk up or risk your life in an automatic elevator which you start by getting into it, closing the door and pushing a button. If it doesn't stick between floors or go to the top, fail to stop and drop, you are all right. But most of the time you walk and when you get to the top, you find that your man is not in and will not return until next Tuesday. I waited three days to see the man whom I had come to Paris most to see.

All good French hotels have telephones in the rooms, but the phones are practically useless. This is partly due to the fact that the Paris telephone system, which is owned and operated by the government, is the worst on earth. But it seems to be nobody's duty in particular to operate the hotel switchboards, and anybody who happens along when there is a call answers it. If the call is for a guest in the house, the easiest way is to tell the person at the other end of the wire that the one for whom he inquires is not stopping there. I knew of two men who became tired of having their friends told that they were not stopping at the hotel where they were quartered. So they went to the man who was at the telephone switchboard and asked for themselves. They were promptly told that no such persons were stopping at the hotel. When doubt was expressed, the man insisted that the men whom they sought were not registered there. Then the men disclosed their identity, said they were guests at the place, and asked what was the matter. They never found out.

Another thing the French cannot do well is to run a place where travelers' checks are cashed. One day I called at the office of the American Express Company in Paris to get one of their checks cashed. I went to a window over which was an inscription that indicated I could be served there and took my place in line. After a wait of several minutes I reached the window only to be told to go to Window Number 4. I took my place in line there, waited 10 minutes and was told to go to Number 6. I repeated the process at Number 6 only to be told to go to Number 8. After a wait of 10 minutes I was told to go to window Number 10—but I did not go.



"There is one thing French chauffeurs can do—blow their horns. Paris is full of taxis."

Instead, I went to a desk and inquired for the manager. I was told that his office was on the fifth floor. I did not like the idea of walking up and hesitated a moment. While I was hesitating, I was told to see a man at another counter. He was the manager, as I afterward learned. He was from Brooklyn and lent a sympathetic ear. When he heard my story, he was as indignant as I was. He asked me to lead him to the window where I had last been turned away. He asked the clerk if he had refused to cash my check. The clerk said he had. The manager asked why. "I was busy," replied the clerk, a youth of about 24 years.

"We can't get Americans to hold these jobs," said the manager, "and have to employ these French boys. They are very nervous and not very good, but they are the best we can get."

French women are not good-looking but are dressed with much taste. French men are "washouts" if the wife of a Chicago friend of mine can be believed. They apparently know little about dressing. Frenchmen's hats are fierce. When a young Frenchman wants to look a little doggy, he raises a full beard, and if he wants to add a knock-out, he gets a low-crowned, black felt hat, with a broad brim, slightly rolled at the edge.

There is one thing the French can do—that is to say, French chauffeurs can. They can blow their automobile horns more times to the minute than any other chauffeurs on earth. Each car has a little rubber-bulb horn of the sort that was used in America 20 years ago. As there are no traffic regulations worthy of the name, each taxi-driver looks after himself, and inasmuch as he will lose his license if he hits anybody, he keeps his horn going most of the time. I have stood in front of my hotel and seen drivers blow their horns half a dozen times in the course of a short block. Paris is full of taxis and they keep up an incessant tooting until two or three o'clock in the morning.

Paris impressed me as being a city that exists chiefly to cater to tourists. The streets are crowded all the while, but with people who seem to have nothing worth while to do. Great crowds sit at tables on the sidewalk and drink coffee two or three times a day. When a Frenchman is doing nothing else, he is drinking coffee.

I enjoyed Paris, but I did not turn around to take a last look at it. On the way to Cherbourg, I saw weeds growing between the rails of the track. I saw women washing their clothes in rivers. I saw stone houses, with the roof of a wing fallen in while the family continued to live in the upright, without repairing the roof. I noted the out-of-date cars that composed the train—out-of-date from an American point of view. And when, near midnight, I saw, four miles out in the blackness, the gleaming lights of the big ship upon which I was going to return to America, I was glad.

The Facista government going to see the king, October 31, 1922, just after the March on Rome. On Mussolini's right is General Diaz, on his left is Adm'ral Thaor de Reval. This was the first occasion in his life on which Mussolini wore a top hat.

Mussolini and Italy's Remaking

Cold Violence as Instrument of Good Government

The following article is written by one of the soundest authorities on Italy at the present time; but owing to the fact that he holds an official position in that country he is not able to write over his name.

TO ONE who has followed the vicissitudes of Fascismo from the formation of the Fasci di Combattimento in 1919 up to the present hour, the prospect of Italian politics has never appeared so dark and uncertain. It is just two years since the Blackshirts marched through the Aurelian wall into Rome, and, in their own oft-repeated estimation, opened a new era. In those two years, which their leader the other day proclaimed to have passed as a flash, they have been reaping the fruits of victory and suffering from the impact of problems whose handling by others it had been so easy to scorn. To adopt the phraseology of the French Revolution, October, 1922, was Thermidor, the month of heated enthusiasms; October, 1923, was Fructidor, the month of fruitfulness; October, 1924, was Pluviose, the month of storms.

All through this time it has generally been possible to foretell with some accuracy the developments of the next few weeks. The month of heat naturally causes germination, and is followed by the month of blossoms. But who can tell what will follow the month of storms? Will the rain nurture or will it drown? If winter comes, spring cannot, perhaps, be far behind, but will it in Italy be a Fascista spring? It is easy enough to describe the germination, the blossoming, and the fading of Fascismo. One can number its rather weather-worn petals; but one would be bold if one declared dogmatically that the plant itself was living or dead.

I will perform the easy part of my task first and consider the movement at its germination. In October, 1922, Fascismo started off with the most noble ambitions and ideals. It was a revival of the World War spirit, a living protest against those who insulted the men who had fought for Italy, a conscious attempt to prove that their sacrifice had been worth while. In this sense it was but a larger replica of the leagues of youth, of ex-service men, and so on, which sprang up all over the world to assert that the wisdom of the old was a fraud since it had led the world into war, and the strength of the young was a reality because it had won that war for the right cause.

Secondly, Fascismo was a revolt against administrative inefficiency which spent half as much again in Italy as the taxes brought in; bankrupted municipalities right and left; converted Parliament into the battleground of infinitely divisible political groups; made the Italian railways and posts the laughing stock of Europe, and reduced their country to a picker up of crumbs from the Entente table.

Thirdly, it was a protest against private immorality, against graft of all kinds, gaming houses, pickpockets, and rascality generally. Only secondarily was it a revolt against Socialism, only, that is to say, insofar as Socialism was responsible for the above evils. It is the fashion to say that Fascismo saved Italy from Bolshevism. This is quite untrue. The fiercest extravagances of the Reds were over two years before the Fascisti marched on Rome. The high-water mark had been reached in the seizure by the operatives of the Turin factories in 1920, and the collapse of this attempt ended the real danger, though it left behind it a trail of troubled industrial relations, and wretched efforts at political blackmail by means of strikes. But, in October, 1922, Fascismo forced the crisis for its own ends, to achieve the power to put into practice its ideals, and not in the least to save the country from Bolshevism.

The second period, the month of blossoming, October, 1923, found those ideals in practice, and Fascismo at the very height of its glory. It had pursued an admirable foreign policy, which had made peace with Jugo-Slavia, the heir of the traditional enemy, and lifted to unprecedented heights the prestige of Italy abroad. The one exception, the bombardment of Corfu, seemed to most foreigners inexcusable, but it was approved of unreservedly by the Italians, even the Opposition press joining in the chorus. At home, Fascismo had put an end to strikes, proclaimed the principle of class co-operation, and passed a law limiting the hours of daily labor to eight. It had restored the public services to efficiency. Trains no longer wandered into the wrong station six hours late, decanting passengers happy to be in any station at all. Government officials no longer universally belonged to the four-hours-off-for-lunch club. The finances had been restored, and a deficit of 20 per cent reduced to 6 per cent, with every prospect of a balance. The defense forces, rotted by contemptuous neglect, had been galvanized into spirited ardor. At this moment of supreme triumph and material efficiency, began, or rather came into prominence, that moral turpitude which was destined to produce a dramatic change.

Fascismo had never been unchallenged, and had never secured the support of all men of high principle in Italy. There were some who from the very beginning of its power recognized that this was the fight between democracy and an autocracy of a very curious kind, in that it was not reactionary, but merely incredibly pretentious. Its philosophic basis was the maxim that the ends justify the means, that since in one party—itself—were concentrated all the virtues of patriotism and intelligence, the members of that party were like the king, who "can do no wrong." The benefits they conferred on all Italy were conferred out of the kindness of their hearts, and Italy was to pay for their august blessings by recognizing their supremacy everywhere and in all things. There were thus many who said that the Fascisti had merely substituted a Black tyranny for a Red, but their murmurs against the moral degradation of the system were lost in the blaze of its material achievements. The Fascista excesses were excused in the belief that Mussolini at least was at heart sensible and moderate, and that he would control his followers in his own good time.

But, in fact, the grumblers were even more accurate than they supposed. The ominous facts that the Fascisti openly gloried in such events as the beating of Opposition statesmen in the streets, the knocking senseless of

Sacking of the *Epoco* newspaper offices, via del Tritone, Rome, by Fascisti.

any candid critic, the sacking of an ex-prime minister's house, and countless outrages against the property of their real or alleged opponents; and that no one was ever arrested or punished for these crimes, were not the result of exuberance of spirits or the inevitable lapses from rectitude of a speedily created organism, but were of the very essence of the Fascista policy. It was *true* that there was no personal liberty; and that those who were against Fascismo were outlaws with no civil rights of which to speak. It was *true* that the police force was rotted by the necessity of showing favoritism amounting to blindness toward the Fascista peccadillos. It was *true* that many of the latter profited by their new-won position to indulge in graft of various kinds; and it was *true* that the constitution itself was undermined by forcing through a trembling Parliament an electoral law which gave the most disproportionate advantages to the party which secured a bare majority. The passage of this law should have opened men's eyes. It was a deliberate and official abuse of power; and however excusable the original seizure of that power by force, there could be no shadow of reason for imposing its permanence by fraud.

This extraordinary contradiction between material efficiency and moral materialism is thoroughly borne out by the character of one man who is responsible alike for the good and the bad. Benito Mussolini is a man of great personal courage, immense capacity for work, magnificent organizing ability, and oratorical talents of the highest class. He is also blatant, vulgar, and inordinately conceited; not so much wise as cunning; not so much strong as violent. His ordinary good sense is betrayed by gusts of passion when he is hardly responsible for his actions. He is, in short, a born revolutionary, who firmly believes in cold violence as an instrument of government, though he has sense enough to see that violence does not always pay. That this estimate is not exaggerated will be attested by all who have been privileged to see him in repose and in anger, or by a glance at the bewildering changes in his internal policy. I pass over the great conversion from Socialism to Fascism, because it is clear that his support of the war and his consequent abandonment of the Socialist party, of which he had been such a shining light, was a noble impulse for which he was ready to risk his life and did risk it. It is, however, perhaps worth recalling that in June, 1914, a series of outbreaks in the Romagna of a revolutionary and republican tendency were organized and led by Mussolini. But it is really sufficient to tabulate his proceedings since he came to power, and the result is the following:

1. He forms a coalition government of all the non-Socialist parties.
2. He drives out all the non-Fascisti.
3. He makes advances to the Opposition chiefs.
4. He allows those chiefs to be maltreated with impunity.
5. He passes the electoral law.
6. He appeals for pacification, co-operation, and so on, to those whom that law had politically murdered.

Every change is the seesaw between extremism and moderation. Every delay in insisting upon the latter increases the domination of the former. Every little victory of this extremism made more and more inevitable the tragic scandal of June, 1924.

The murder of the Socialist deputy Matteotti for no other reason than that he was the most disquieting adversary of Fascismo brought down the reputation of that movement with a crash that echoed through the world. It is really rather surprising that it should be so. Political murders are not uncommon, even murders surrounded by every conceivable circumstance of deliberate butchery and premeditated brutality. There have been a thousand political murders on both sides in Italy during the past three years, and the Fascisti alone boast of their 3,000 dead. I think the reason for the concentrated horror aroused by this particular murder was that the only possible justification for such a movement as Fascismo, for such an action as the March on Rome, is that it should be, morally speaking, absolutely unsullied. Those who claim all the power must possess, like the golden race of Plato, all the virtues. Now it is obvious that the Matteotti crime arose out of the Fascista system and was made possible by it. Of course, hundreds of thousands of Fascisti are absolutely guiltless at law; but all stand, or stood, for being a law unto themselves. No one except his unreasonably intemperate enemies suggest that Mussolini had the slightest connection with the crime. But those arrested for it were of his entourage, he himself has justified the philosophy of "dying or killing for Fascismo"; and the general impression is, not that he knew of the crime, but that he must be less able, less "furbo," than people imagined, not to have known about it. The omniscient hero had a spot of ignorance after all; and this decline of the belief in his talents has had a profound effect. For the popularity and reputation of Mussolini personally counter-balanced the unpopularity and disrepute of his followers. The legend was that he was playing with his extremists as a cat with a mouse. The truth appears that they were playing with him.

The danger of an explosion immediately after the

After sacking the headquarters of the Socialist party, the Fascisti rush across the Piazza del Popolo waving trophies. The photograph is of Karl Marx.

Mr. Ford's Page

PRESIDENTIAL addresses, like party platforms, have fallen upon public indifference since the war. Not that the people are incompetent to read a President's message to Congress; the chief cause of indifference has been that Presidents have so little to say that seemed to the people to be vital to their daily concerns.

President Coolidge gave a message to Congress on December 3, that deserves the widest reading. Evidently here is a President who speaks only when he has something to say, and has nothing to say that does not get close to the people's problems.

We devote this page today to the purpose of giving its readers a taste of the practical-mindedness of the President by quoting from the first part of the message. A President who thinks and speaks as Calvin Coolidge does promises well for the nation. Read these passages and see.

"I do not profess that we can secure an era of perfection in human existence, but we can provide an era of peace and prosperity, attended with freedom and justice and made more and more satisfying by the ministrations of the charities and humanities of life.

"Our domestic problems are for the most part economic. We have our enormous debt to pay and we are paying it. We have the high cost of government to diminish and we are diminishing it. We have a heavy burden of taxation to reduce and we are reducing it.

"But while remarkable progress has been made in these directions, the work is yet far from accomplished. We still owe over $21,000,000,000, the cost of the national government is still about $3,500,000,000, and the national taxes still amount to about $27 for each one of our inhabitants. There yet exists this enormous field for the application of economy.

"In my opinion the government can do more to remedy the economic ills of the people by a system of rigid economy in public expenditure than can be accomplished through any other action.

"The cost of our national and local governments combined now stands at a sum close to $100 for each inhabitant of the land. A little less than one-third of this is represented by national expenditure, and a little more than two-thirds by local expenditure. It is an ominous fact that only the national government is reducing its debt. Others are increasing theirs at about $1,000,000,000 each year. The depression that overtook business, the disaster experienced in agriculture, the lack of employment, and the terrific shrinkage in all values which our country experienced in a most acute form in 1920 resulted in no small measure from the prohibitive taxes which were then levied on all productive effort.

"The establishment of a system of drastic economy in public expenditure, which has enabled us to pay off about one-fifth of the national debt since 1919 and almost cut in two the national tax burden since 1921, has been one of the main causes in re-establishing a prosperity which has come to include within its benefits almost every one of our inhabitants. Economy reaches everywhere. It carries a blessing to everybody.

"The fallacy of the claim that the costs of government are borne by the rich and those who make a direct contribution to the national treasury can not be too often exposed.

"No system has been devised, I do not think any system could be devised, under which any person living in this country could escape being affected by the cost of our government. It has a direct effect both upon the rate and the purchasing power of wages. It is felt in the price of those prime necessities of existence, food, clothing, fuel and shelter.

"It would appear to be elementary that the more the government expends the more it must require every producer to contribute out of his production to the public treasury, and the less he will have for his own benefit. The continuing costs of public administration can be met in only one way—by the work of the people. The higher they become, the more the people must work for the government. The less they are, the more the people can work for themselves.

"Of course necessary costs must be met, proper functions of the government performed, and constant investment of capital account and reproductive effort must be carried on by our various departments. But the people must know that their government is placing upon them no unnecessary burden."

The President, to judge from the following passage, will not be easily misled by suggestions which pretend to be in the interest of the people of Europe when really they are only in the interest of selfishly motivated financiers:

"Ultimately nations, like individuals, cannot depend upon each other but must depend upon themselves. Each one must work out its own salvation. We have every desire to help. But with all our resources we are powerless to save unless our efforts meet with a constructive response.

"The situation in our own country and all over the world is one that can be improved only by hard work and self-denial. It is necessary to reduce expenditures, increase savings, and liquidate debts. It is in this direction that there lies the greatest hope of domestic tranquillity and international peace.

"Our own country ought to furnish the leading example in this effort. Our past adherence to this policy, our constant refusal to maintain a military establishment that could be thought to menace the security of others, our honorable dealings with other nations whether great or small, has left us in the almost constant enjoyment of peace."

That President Coolidge does not share the swollen conception of some members of his party that the last election placed them above the law and straight American practice, may be adduced from these words:

"It is axiomatic that our country can not stand still. It would seem to be perfectly plain from recent events that it is determined to go forward. But it wants no pretenses, it wants no vagaries. It is determined to advance in an orderly, sound and common-sense way. It does not propose to abandon the theory of the declaration that the people have inalienable rights which no majority and no power of government can destroy.

"It does not propose to abandon the practice of the Constitution that provides for the protection of these rights. It believes that within these limitations, which are imposed not by the fiat of man, but by the law of the Creator, self-government is just and wise. It is convinced that it will be impossible for the people to provide their own government unless they continue to own their own property."

The President shows appreciation of the business problem involved in his Administration. The "overhead" cost of Government is clearly exhibited as one of the matters weighing on his mind. "Anybody can reduce taxes," he says, and that in itself is very interesting information, since the general impression has been that tax reduction was precisely the thing which government officials felt could not be done.

"Anybody can reduce taxes," says President Coolidge, "but it is not so easy to stand in the gap and resist the passage of increasing appropriation bills which would make tax reduction impossible. It will be very easy to measure the strength of the attachment to reduced taxation by the power with which increased appropriations are resisted."

That is very wisely said. Measured by this standard President Coolidge proved his attachment to reduced taxation very early in his Administration.

DID you read the President's message to Congress? Or did you pass it over because in the past Presidents' Messages have seemed to be directed to the politicians and not to the people? Calvin Coolidge has just made a communication on the public business that can be understood by any citizen and that touches every citizen's concerns. There is nothing high-flown about this message; it comes down to matter-of-fact treatment of the nation's daily affairs. It takes up the matter of taxes in an almost revolutionary way—it says the things that the people always say and that Presidents so seldom seem to know. It goes directly to the roots of the tax trouble and it proposes action which is so full of common-sense and so practicable that it seems to be the production of almost any place other than Washington.

A volume of 452 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Festival of Christmas

OUT of the darkness of winter dawns a glowing day—The Mass of Christ, the ancients called it; Noel, the Nativity of the Lord; Yuletide. It is Christmas in these lands, with all its background of memory and all its present spirit of good will. Christmas as only it can be, with the significance of the time in mind, even if modernly subdued. For beyond doubt people are feeling the diminution of Christmas. Nor does it spring from the necessary commercial accompaniments of widespread festival observances. Gifts must be made and even sold to those who cannot make them for themselves, and the glory of the Christmas shops is no small part of the color of the Season. It is ungrateful to charge all this labor and zeal, mingled of no small amount of good will, with having cheapened Christmas. Nonetheless people are conscious that something has changed. In recent years they sought in vain for cards with Christmas sentiments and greetings. This year people have looked in vain for Christmas in the magazines, but the only recognition they observe is a cover design—the Christmas story, poem and play seem to be things of the past.

What has wrought the change? Our easy surrender, it seems, to the wiseacres who wish to shear Christmas of its significance. A pagan festival, revamped for Christian uses, we are told. But why this special pagan festival? Why not some other one? Surely there were plenty to choose from! Just "a symbol of the eternal child and the cradle endlessly rocking," we are told. But there have been babies and cradles since the world began; why did it remain for Christmas to take its rise just when it did?—just when the world was perhaps less likely than ever to idealize babies and cradles. The degeneration of Christmas began with such dwarfings and attenuations as these. Its meaning was withdrawn; this left it bloodless; Christmas is suffering from spiritual anemia.

The consciousness of this is the cure of it. What people begin to miss, they proceed immediately to replace. We shall see a revival of Christmas. Not only will many of the ancient customs return (are they not already here in the "waits" and in community Christmas trees all topped with the Star?) but the meaning will come back as well. The classic narrative of the Bethlehem Night will stir to life in all its details. There is not a line in all the story that is incompatible with the modern mind. It is all outdoors and supremely natural. Shepherds in the fields. Wayfarers at an inn. Spiritual intelligences round about. That is life. At Easter the Christian world proclaims its hope of passing into a spiritual world; death is glorified as the gate through which we break into another plane. The emphasis at Christmas is different; it is the spiritual world breaking in upon this. It is the spirit of incoming, not of outgoing. Shepherds and angels; the mingling of the worlds. A Star in the sky, and "the hopes and fears of all the years" meeting at a cradle. "And suddenly there was with the angel a multitude of the heavenly soldiery singing Peace!—peace on earth to men of good will." Take the Christ out of Christmas and even the alleged pagan elements fade and die. In Him the worlds are one.

What people miss, they will return and find. They will find Christmas again where Christmas began—at Bethlehem.

The Ghastly Truth

A WRITER in one of the leading English papers makes a few remarks on the language of the country as it is spoken today. What has been said about the English language as now spoken falls short of the "ghastly truth," he says. This critic asserts that "the whole island has become a suburb of 'Byker-street styshun,'" and that lonely farmhouses will oblige with a bucket of water for your "rydi-ytor," while Welshmen will point you the "wye" to Llanfihangel. In Suffolk, he says, the gaffers sit in the inglenook, nursing their quart pots and discussing the "expropri-yshun of the gryte estytes."

Shades of Dan Chaucer and his "well of English undefyled!" not to mention Shykespeare, and Spenser, and Dryden and Pope! Have the war and the movies and the "Dyly Mile" brought Old England to this? Or is it the pernicious effects of the nine months' regime of the Socialistic government?

Years ago it was said that the best English in the United Kingdom was spoken in Inverness and Dublin, and now this horrified writer declares that "today the only district where decent, disappearing English is habitually spoken is Virginia and the Carolinas," and suggests that the new Minister of Education should import elementary teachers by the thousand from these states.

It is a comforting thought that there are at least a few corners of the earth where the well has not been contaminated. But if this process goes on it may soon be necessary to organize a society for the conservation of the English language, to avoid the possibility of having to go to Kamchatka or Tibet for qualified teachers.

Meantime, it is a comforting thought that down in old Virginia and the Carolinas the descendants of the Elizabethan and Carolian pioneers have kept the linguistic faith. Missionaries are apparently urgently required if the people are to be properly "eydukited" in the tongue of their forefathers.

Colleges Are for It

"LIGHT wines" put France at the bottom of the list in the Olympic games, with 26½ points, while the prohibition United States led the list with 255 points. Prohibition Finland won 166 points, while "personal liberty" Great Britain won only 85½ points.

These figures are brought to mind again by the results of the debating tour conducted in this country by teams from Oxford and Cambridge. In their meetings with the debating teams of American colleges and universities, the visitors proposed Prohibition and the League of Nations as their favorite subjects. Though judges presided the verdicts in most instances were directed by the vote of the audiences. Here are some collegiate verdicts on prohibition:

At the University of Michigan the audience decided that the Michigan debaters had worsted the Britishers, the vote being 1,247 to 520. At the University of Minnesota the vote was 1,348 for the prohibition defenders, to 493 against. At the University of Cincinnati the vote was 1,714 for to 698 against. At Coe College, 437 for to 95 against. At Hillsdale College 432 for to 88 against. At the University of Kansas the vote was four to one for prohibition.

It would seem that Prohibition is capable of producing equally good records on the athletic field and the debating platform.

We Join in Peace

THE announcement—quite seasonable at Christmas—that the United States will join the international Conference on the traffic in arms and ammunition, will be received with approval. Here is a definite desirable object to be attained, something far from the haze of European politics, something of direct bearing on international morality and policy. It is desirable that a recognized code of conduct be imposed upon nations in their trade in the instruments of warfare. Our own nation faced that question in the recent world struggle when we were charged with being the willing purveyor of death-dealing machinery to either or both belligerents. The Conference, it is hoped, will open up every phase of the question. It is in the nature of the limitation of armament, to begin with, and the commercial rights of neutrals to end with. These questions can never be determined by diplomatic strategy, but only by forthright international desire to reduce to a minimum the causes of war. In conferences like these the United States may well participate if only to signify its willingness to co-operate in the maintenance of the peace.

The Lady of the Limberlost

THE sudden death by accident of Gene Stratton Porter will be felt as a personal bereavement by hundreds of thousands who have known her through her books. Here was a woman, set down in the midst of a most perfervid industrial generation, who elected to write about moths and birds and marshlands, and weave romances of mingled Nature, inanimate and human, and whom the world followed in multitudes, giving her fame and wealth and what is far better, affection and confidence.

Mrs. Porter's work was marked by this mingling of human and "natural" nature. "The Girl of the Limberlost," which first brought her prominently to the attention of the reading public, was really a story of the moths and birds and wild flowers of that now famous stretch of Indiana swampland. "Freckles" dealt more particularly with the woods and with trees. "The Harvester" is a romance of roots, the medicinal herbs of the woodlands, and how the gathering of them led to significant things in human life.

A career like that of Gene Stratton Porter provides a scale by which to measure popular taste in literature. Where there is a multitude of writers the majority of whom fail to win widespread attention, there is always a tendency to affect to despise popular success. Popular literature is supposed to be cheaply wrought. Yet, if anything is true about the classics, it is that they were made by popular approval. The highest reach of creative genius in literature, be it Bible or Shakespeare, were popular successes, and remain so.

The books of Gene Stratton Porter have sold over eight million copies to date. Why? Because she touched life where most people live. The Freudian writers don't do that. One fact about the shady sex fiction of the time is that it does not sell. It is not popular. The noise that is made in its behalf is mostly bought and paid for, and the rest is neurotic or an ill-directed claque toward "freedom." And this is not due, as the sour-grape critics contend, to the public's childish love for the pleasant. Sinclair Lewis' books were not pleasant, yet they were popular—because they were true. There is a world of difference between the Porter books and the Lewis books, a difference too in the writers' status as literary artists, but both hit true and the public sealed their truth. Truth that is virile with life, human truth and not special pathologic facts, always seems to get the right of way.

The Re-awakening of Russia

THE attempt of the Russian Soviet government to stifle private enterprise and to set up a state monopoly in all trading has proved a complete failure. According to estimates made by responsible Soviet leaders, private capital controlled, by the beginning of 1924, fully 80 per cent of the retail and over 50 per cent of the wholesale trade of the country.

Lenin had not been long in power when he discovered that the death of private enterprise meant the economical paralysis and industrial death of the nation, but he did not foresee how rapidly private enterprise would reassert itself in spite of his efforts to quench it against his better judgment.

In spite of the lessons that have been taught, the whole machinery of the Soviet is now directed toward fighting private trade by substituting for it trade carried on by the state and co-operative organizations. The idea that "capitalism" must be killed has become an obsession with the clique of communist demagogues that now dominate Russia.

The trouble with the Russians as a people is that they lack initiative, and like sheep are led or driven by the bureaucrats who have seized the reins of power. The whole trend of the Soviet is to discourage individual effort and to level down whole communities to the level of the lowest intellect within it. This policy is being carried out in their schools; they are poisoning the wells at their source, and the plague of misery and destitution that is coincident with Russia's recently found "freedom" is the outcome.

But there is arising in that unhappy country a steadily growing volume of public sentiment which refuses to be thrust back into a state of serfdom far worse than that which prevailed in the time of the czars. Lenin and his successors may have trampled upon and mutilated the body of Russia, but it still retains its soul. It may be that the Russian soul needed this last humiliation to stab it wide awake. The wave of corrective conservatism which has reestablished stability in the United States, which has given a feeling of security to Britain, and which has been the keynote of the Fascisti in Italy, is rising to something more than a ripple in Russia.

The Tower of Babel—A Modern Instance

Some Dangers That May Arise From the Polyglot Population of This Country

By CASPAR F. GOODRICH
REAR ADMIRAL, UNITED STATES NAVY

THE reading of the Bible is less habitual among us than it was among our forebears in the early days of the Republic and the lessons contained in its pages are too often neglected, pertinent as some of them be even in our own time. An instructive warning is found in the story of the Tower of Babel. When the Lord "came down to see the city and the tower, He said, 'Behold the people is one and they have all one language . . . . and now nothing will be restrained from them which they have imagined to do.'" Surely in the Old Testament account of the result of the Confusion of Tongues we have the best warrant for holding that unity of speech is essential to constructive progress in any and every national undertaking.

Are we committing the grave mistake of fostering the growth of many alien tongues in this land of ours? Are we, even unconsciously, failing to uphold English as our national language and to insist upon it as the sole medium in all official transactions? These questions are of more than passing interest. They deserve careful thought and study before it is too late to avert disaster through the breaking up of our population into discordant and (except when combined against the Anglo-Saxon majority) mutually antagonistic elements based upon race and language.

Consider a modern instance. Few persons realize that the fundamental obstacle to the establishment of a Chinese Republic is lack of a common speech. Practically every province has its own dialect, an insuperable bar to harmonious and concerted action. The inability to pull together, due to the cause mentioned, seems to me and to many who have more extended acquaintance than I with that far-off land, to spell the hopelessness there of any form of self-government.

Foreign Language Publications

ARE we creating a polyglot population? The evidences that we are lie on every hand, to meet the eye and the ear. Notices in foreign languages are posted in multitudes of public places. They no longer occasion comment or remark, so common have they become. Of newspapers and periodicals in alien tongues, there are well more than a thousand with individual circulations, in certain cases, reaching hundreds of thousands daily. Too many of these are distinctly anti-American. Even those which are not unfriendly to our institutions have the evil effect of discouraging the acquisition of our national tongue. A report for 1921, which is incomplete, because many made no returns, under this head, puts the circulations of our foreign-language publications at more than eight million. It lists forty-odd tongues from Albanian and Arabic to Ukrainian, Welsh and Yiddish.

Without as much as hinting that these should be prohibited, it is only a matter of self-protection against a strongly disintegrating influence and of furthering the cause of Americanization that their growth should be checked and that measures should be promptly taken to curtail their circulation. This is not a question involving the limitation of free speech. It is entirely proper to contend that every foreign language publication in this country tends, unwittingly, perhaps, but none the less powerfully, to discourage the learning of English, the language of the nation. If the alien prefers not to learn it he is quite within his right not to learn it, but the exercise of that right is of the nature of a luxury for which he should be willing to pay. It has been suggested that this can be accomplished, without incurring any noticeable burden, through imposing an insignificant tax, such as one cent on every copy of such a daily, five cents on every copy of such a weekly, and ten cents on every copy of such a monthly, quarterly, pamphlet, book, and so on. Also, it is urged, every public placard or notice in a foreign language should have a government stamp varying from one cent upward, according to the size. It is stated furthermore that such an impost while bringing in a welcome revenue, estimated at from $25,000 to $50,000 a day, would, at the same time, work effective good in a constructive sense, through furthering the solution of that grave national problem, Americanization.

Treasonable Posters

IN ANY event, an English translation of every such issue should be filed with the local Federal attorney over the signature of a responsible person who, in the case of a dangerously faulty or misleading English rendering, could be punished as guilty of a misdemeanor, by adequate fine or imprisonment or both.

A similar restriction should be placed on every foreign-language notice or placard which, in addition, should bear on it an English translation over the name of the author, the incorrectness of which could be followed by sufficient penalty. Doubtless there would then be fewer of these treasonable posters, beginning with, "To Hell with the Government."

We Americans are wretchedly poor linguists, hence, as a rule, we do not understand the import of the placards in other tongues than our own nor know whether they are incendiary or innocuous. It is to be feared that the following incident is only too typical.

At the last annual meeting of the Pennsylvania Commandery of the Military Order of Foreign Wars, a distinguished member said, among other things:

> "Just outside one of our large eastern cities, beside the railroad, there stands a large sign which insults intelligence and the effrontery of which should outrage every American, 'Tell it to them in their language.' Knowing something of Yiddish, I have found in one section of the city (Philadelphia) placards beginning with "To hell with the government' . . . . Within a month, I crossed from my office to buy a morning paper; I found papers in seven tongues and in no one of them was English represented by the paper on sale. This is not a theoretical and academic or a philosophical question. It is a practical question. Those of you, supposed by your condition in life to be beyond it, sense little, not only of the possible danger, but of the probable."

How long shall we, blindly and foolishly, allow this "outrage" to continue? It is of common knowledge that New York is almost the largest Italian city in the world; that it contains about one-tenth of the Jewish race; that there are communities, more or less large, in various states where English is neither spoken nor understood; that in the southwestern part of our country, Spanish has, frequently, to be employed in courts for the administration of justice; that foreign groups in various cities demand that their co-nationalists shall be local judges, policemen and other public functionaries, that their language alone shall be there employed and that speakers addressing recent meetings in English have been howled down and driven out. Where and when is this thing to end? It seriously menaces our national homogeneity and progress in civilization. Unless the bricks and masonry are tied together by a proper cement, the building is doomed, sooner or later, to crumble to pieces—its ruins a monument to the master's folly. In our national structure no binding material can be substituted for the English language. Anti-English language movements can have but one effect, the continuance of factions opposed to each other and to the traditions and policies which have made this country what it is today, the marvel and the envy of the whole world.

No foreigner is invited to our shores. He comes of his own accord. Too often, especially when sent here by hostile governments or associations, he brings with him the obligation to overthrow our institutions and to set up a rule distinctly opposed to the wise scheme of our fathers. In carrying out these tasks, *he would be well-nigh helpless were he obliged to use English in his published appeals* to the ignorant and his preaching of racial and class hatred. But he finds on our soil large bodies of men of his own blood and speech who greedily credit his promises of the millennium which he falsely describes Russia as now enjoying.

Of course, there are among us "pinks," half-cracked fanatics, deluded disciples of *a socialism proved utterly impossible by no less than thirty-four failures in the United States* listed by Daniel J. Ryan, former secretary of the State of Ohio, *with not one success anywhere or at any time from the days of Sparta to the present.* The real danger lies in the vast alien population to which the franchise is given with a foolish prodigality that would be laughable were its effects not so tragic. It is not pleasant to hear of the "German, Italian, Polish or Yiddish vote" for which politicians too often sacrifice the real good of the people.

Ability to read and speak *English* ought to be an adamantine requirement before granting first papers of naturalization. It is idle to argue that a foreigner can vote intelligently when he is ignorant of our language. Incidentally it may be observed that naturalization papers should be "valid only during good behavior" and that the preposterous statute preventing ourselves from deporting an alien who has been in this country five years should be repealed without delay.

Qualifying for Naturalization

ESPECIALLY since 1890, the majority of our immigrants are illiterate and they do not speak English, hence they are unable to understand our institutions or to grasp the fact that here exists a liberty denied them in the land of their birth. Moreover, lacking the individual intelligence requisite in our citizens, being easily susceptible to argument based on racial or class animosity, they fall prey to the glib agitator who harangues them in their own tongue. Hence we see that menacing thing, "mob action." And upon these politically incompetent we shower the suffrage with recklessly indiscriminating bounty, thus empowering them to take part in framing laws for our governance. That this should be so is a sad arraignment of American intelligence.

Naturalization ought to be a highly coveted prize granted only to those who have proved themselves by mentality, character, industry and spotless record, to be worthy. The *sine qua non* should be *knowledge* of *English* both written and spoken.

It is, by the way, eminently proper to inquire into the motives of these foreigners who apply for naturalization. If their object is, in bettering themselves, to help us in our task of advancing civilization through wise government and to become loyal members of our body politic they should be welcomed; but, at times, a reasonable doubt arises on this point. An illuminating instance may be cited.

I had occasion to look into the statistics under this head in the city of Philadelphia for the year 1916. I found that 60 per cent of the naturalizations in that period and district was granted to Russians. That was while Russia was at war with Germany and the United States at peace. Is the inference natural that these applicants for naturalization largely sought to avoid military service in defense of their own country? And was it not, on our part, a *quasi* breach of neutrality to countenance this weakening of a friendly nation's power of resistance? Yet no one seemed to perceive, much less to protest against, this attempt to evade a plain duty by making a selfish use of our lax system of naturalization as a bridge from danger to safety.

A searching investigation would appear to be desirable if not imperatively necessary, to elicit in every case answers to those fundamental questions, "Can you read and speak English?" "Why did you leave home?" "Why do you want to become an American citizen?" "Who advised you to present yourself here?" and so on. This interrogation should be made in English, should be carried still further in scope and should be varied in phraseology and the order of asking so that the questions cannot be answered by repeating from memory sentences taught by professional coaches. If any answer be in the least unsatisfactory or if an interpretor is needed, the application should be rejected summarily.

A Common Tongue Necessary

IT IS not an exaggeration to say that our future as a united people depends absolutely upon our possessing a common tongue; that every legitimate means should be employed to extend a knowledge of that common tongue and to discourage the growth of any other as the habitual medium of intercourse and publicity. I do not mean to frown upon the acquisition by Americans of other languages in addition to English; far from it. I myself read, write and speak three such and have a bowing acquaintance with a fourth. None the less do I urge my fellow citizens to support our legislators in every measure they may conceive to maintain English as the national language and to check the growth and employment of any other. If we and they fail now in this important duty, we shall be false to the fathers of this Republic and responsible for the creating of a new Tower of Babel. If this matter is given due consideration by the aliens in our midst who desire to become American citizens in the full extent of those words, they will realize that it is to their own interest to favor the suggestions of this article. Of what advantage would it be to them to become members of a political body containing the seeds of its own dissolution?

In answering this question they will realize that what is here written is not inspired by unfriendly motives but by the wish to make this country actually worthy of their adoption.

More About Elmer's Clan and the Muskrats

Concluded from page 4

Boardwalk—in August—may not know it, but she is indebted to Elmer Bowman to the extent at least of a grateful pang, inasmuch as Elmer, at great labor for himself and for those of his clan who braved the Louisianian muck with him, caught the hundred or so rats going into her garment. That is, he *may* have caught them; the thought is not completely improbable. *Some* trapper caught them, and why not Elmer? His boy Robbie and I may have caught some of them, that misty morning in the cattail flats, the morning of the last day of the trapping season, just before the rise came down.

We set out for Honey Island in Robbie's speed boat, since we had far to go to run our traps. We passed the city of Orange at express-train speed, and Robbie punctiliously waved an answering salutation to the flutter of hands marking our bounding passage past the railroad landing. We had two dozen traps out, we had set them out the night before, and Robbie was in a haste to run them since the buffalo fish were "knocking" that day and the sound was music to his ears.

"When the last day of the season rolls round you want to catch every fish in the river and trap every rat in the marsh," he grinned.

Robbie leaned on the wheel. In a wide swishing arc the boat left the river and darted up a canal. We tied up to a willow, drew on our hip boots, and waded out over the marsh, following a red-rag trail marking the location of our traps.

Our catch was small. For my edification Robbie skinned a rat. With a swift stroke of his knife he ripped the pelt from hind leg to hind leg, pulled backward—literally turned it wrong side out over his doubled-up fist—and the job was done.

"One trap short," Robbie announced. "We set out twenty-four."

"We went to every rag. You must be mistaken," I said.

"I'll find it," he answered confidently.

He did find it, and in it the last catch of the season. It was a plump old glistening rat with long whiskers. It had been caught by the left forefoot only, and near the toes at that. After a quick, frantic struggle at our approach it lay quietly, keeping its beady eyes watchfully on us.

"How will you take him off?" I asked.

"It's a she," Robbie answered soberly. Deftly he disengaged the trap, meanwhile gripping the captive firmly behind the ears. He examined her injured toe, gave the little paw a gruffly affectionate shake, and released her. One flirt from the broad tail, one convulsive bubble from the bottom of the ooze, and our captive was gone.

"She was full of young," Robbie explained. "We need her alive—what would me and paw do without her?"

Christmas in Old London—
A Reverie of Merry Yuletides

By W. TEIGNMOUTH SHORE

Drawings by L. Pern Bird

"At Christmas play, and make good cheer,
For Christmas comes but once a year."

And if it came oftener we should scarcely know what to do with it!

A HUNDRED years ago, or is it only fifty?—when I was young—Christmas chiefly appealed to me as a season of unusually abundant, good fare and a plenitude of presents; in brief, I was a quite healthy boy in body and brain. I can't abide those youngsters I meet nowadays who pretend—I can't quite believe them—that they don't care much about plum pudding or mince pies and who sniffingly declare that they have no manner of faith in Father Christmas or in Santa Claus. It is an irreverent and cynical generation, here in England anyway; and it may be so also in America, for all I know to the contrary. But I sincerely hope that the boy or girl has not yet been born who does not welcome Christmas gifts, with their seasoning of love and good will.

But, come, come, I mustn't be grousing and grumbling. I find each Christmas more enjoyable than the previous one. I've not yet grown up, you see; while at the same time experience has taught me how to make the most of the good things and the good folk that come my way. That is where the older are wiser than the younger.

I'm just a small boy over Christmas cards—I like'm Christmassy; snowy and robin redbreasty; with holly, ivy and mistletoe. Too many Christmas cards today might better be called *midsummer cards*:

"At Christmas I no more desire a rose,
Than wish a snow in May's new fangled mirth,"

as Master Shakespeare hath it.

By the way, Christmas cards, like so many other supposedly ancient things are really quite modern, the first, almost certainly, seeing the light in the year 1846, not coming into general use till some years later. The pleasant old fashion of special Christmas stationery has quite died out.

Holly, with lots of red berries; ivy; mistletoe, also with many berries. Listen! What's that? The sound of flute, flageolet and violin coming along this way! And voices of men and boys! It is the waits singing in the frosty air:

"The Holly and the Ivy,
Now are both well grown,
Of all the trees that are in the wood
The Holly bears the crown.
O, the rising of the sun,
The running of the deer,
The playing of the merry organ,
The singing of the choir."

—or "Good King Wencelas," or "God Rest Ye, Merry Gentlemen."

I am not quite so sure that the holly does bear the crown; I cast my vote for the mistletoe. No, *sir*, not because I am fond of kissing the girls—young or old, pretty or plain—beneath the mistletoe bough! I am not so foolish as to wait for that *infrequent* opportunity. But because there is so much ancient lore attached to this evergreen parasite. Is it not a sovereign remedy if you chance to suffer from "convulsive distempers" or a stitch in your side? Did not Sir John Colebatch, that learned man, write of it some two hundred years since: "This beautiful plant must have been designed by the Almighty for further and more noble purposes than barely to feed thrushes, or to be hung up superstitiously in houses to drive away evil spirits."

We do not now hang up the mistletoe to drive evil spirits from our homes but to introduce good spirits! Shakespeare called it "baleful," because in ancient legend Balder the Beautiful was slain by an arrow made of its wood. Afterward the Goddess of Love was appointed its guardian, so now any gentle and kindly lady who pauses beneath it is greeted with a kiss, which is often a preliminary to courtship.

With us, as doubtless with you, there are modern fashions of decking the home for Christmas; paper festoons, paper flowers, Japanese lanterns, and so on. Away with them all! Holly, ivy, mistletoe for me, always! And a Christmas tree! For the kiddies? Yes, and for *me*. The old-fashioned way, with thin pink candles stuck about the branches; and imitation snow; and Father Christmas atop! And plenty of sweetmeats. Whence arose the legend that the Christmas tree is an ancient and British institution, I do not know. It came over to us from Germany some seventy years ago, when German Prince Albert was Queen Victoria's consort. Never mind. I for one can't *see* Christmas without a tree and I don't care even a half-cent from what century it dates. No more does it matter to me—does it to you?—that the hanging up on Christmas Eve of stockings to be filled by Santa Claus during the night hours is but a modern fashion. I have ceased to do it! The presents given to me by my adoring family and affectionate friends do not accommodate themselves to the practice: such like as chest-protectors, mufflers, woollen stockings, warm slippers, and so forth. But I *do* believe in Santa Claus; for I have seen him many a Christmas Eve in—the mirror! He is not at all a bad looking old fellow; indeed, he is the very spit of me.

It is commonly said that Charles Dickens invented Christmas. Rubbish! But he did invest it with a halo of uproarious mirth and jollification, good will and splendid hospitality; and surround it with ice and snow, spices and puddings and sugar and punch. He amplified only; did not invent. What about this for a picture of Christmas, from a book three hundred years old, written by one Nicholas Breton:

"It is now Christmas, and not a drink must pass without a carol; the beasts, fowl, and fish, come to a general execution; and the corn is ground to dust for the bakehouse, and the pastry . . . . A good fire heats all the house . . . . Musicians now make their instruments speak out, and a good song is worth the hearing. In sum, it is holy time, a duty in Christians for the remembrance of Christ, and custom among friends for the maintenance of good fellowship. In brief, I thus conclude of it: I hold it in memory of the Heaven's love and the world's peace, the mirth of the honest, and the meeting of the friendly."

How shall I spend my this year's Christmas? There is varied choice before me. Shall I go to Oxford? I shall feel greatly tempted so to do if the weather be real Dickensy—Christmassy. For when King Frost and Queen Snow take the business in hand Oxford is supremely lovely. The gray ancient buildings, with the innumerable carvings and the hammered ironwork, picked out with white; the lawns as snowy carpets; the boughs of every tree and the twigs of shrubs and bushes glittering with hoar frost in the crisp wintry sunshine—it's a winter's fairyland!

If I did go I would dine on Christmas Day with a friend at Queen's College; a lordly Boar's Head would be carried in gallant procession from the kitchen into the Hall—designed by famous Christopher Wren—to the accompaniment of the Boar's Head Carol, sung by a Precentor, the Latin chorus delivered by the choir.

Or I would visit a country clergyman, rector of a very rural parish, where he and the squire are the only gentlefolk, his parishioners being farmers and their hands. I'd go to church with him morning and evening; a gray, stone building, many centuries old; small, homely, reverend. There would be singing of carols, perhaps:

"Welcome be thou heavenly King;
Welcome, born on this morning,
Welcome, for whom we shall sing
Welcome Yule.
Welcome be ye that are here,
Welcome all, and make good cheer,
Welcome all, another year,
Welcome Yule."

—decorations of holly and ivy and gay chrysanthemums; a brief discourse from my friend upon the glad tidings that the festival celebrates. Back in the evening again to the vicarage, maybe by the light of the moon and over the soft snow, lying "deep and crisp and even"—a red brick house of the days of good Queen Anne, set in an ample garden. Cosy comfort; a snug room; a blazing fire, roaring on the wide hearth; my kindly host and his wife; a well-set table: turkey, plum pudding and mince pies, of which last I would dispose of several, both because they would be goodly and because in the coming year I should have as many happy months as the number of the pies I ate; no use therefore in putting away more than a dozen!—and friendly conversation. And so to bed and pleasant dreams. When with this hospitable friend I always remember the Old World rhyme:

"If thy friend come unto thy house,
For dear love and pure amitie;
Exile sadnesse and show to him
Friendly familiaritye."

But an end to conjecture. I'll stay in London town. In the morning I may wend my way to the chapel of the Foundling Hospital in Bloomsbury, a somewhat worn part of the town, about which it has been said that there "is more of the bury than the bloom." Founded by

(*Concluded on page 14*)

Surely, at Christmastide—on Christmas Eve and on Christmas Day—East, West, *HOME'S* best? At home I will bide, with my own kin.

A Modern Tendency in Education—By FRANCES MARY HUGHES

THE man who declares himself unfit to advance in the world because of early educational handicaps is receiving less and less consideration at the hands of society at large. In a not-so-far-distant past, few people attended either high school or college whose parents did not finance the period, and those whose parents were unable or unwilling to do so were left handicapped in the subsequent struggle with their better prepared brethren.

Certain changes have been wrought in comparatively late years, however, changes whereby an adult possessed of a little spare time and a desire to better himself can rise to undreamed-of heights of cultural or vocational excellence. More and more universities and colleges are offering extension courses, summer sessions, and short courses of whose advantages all mankind is invited to avail itself. To the person prepared for college entrance, work may be taken for credit and applied toward a degree. And for the person not ready scholastically to enter a higher institution of learning, the work may nevertheless be taken with an equal degree of profit to the individual.

There are also vocational courses given in which no college credit at all is given, but of what an advantage such courses are to the man who is eager to keep abreast of late developments in his field!

The University of Wisconsin offered 490 different courses in the extension division last year, and 30,000 persons were enrolled in them. Seventy per cent of these students were residents of the State of Wisconsin, and of the remaining 30 per cent, 400 students were foreigners receiving instruction in their own homes. One student lived only 125 miles south of Alaska's northernmost point, up above the Arctic circle. Another lived in China, ten day's coolie-train travel beyond the farthest navigable point of the Yangtze River. Still other students were workers in the mines of India, dwellers in remote Africa, in Norway and in Sweden. And so the extension work of a great American university goes on, reaching not only those of the homeland, but stretching out a friendly hand around the globe.

And what type and class of Americans continue their education by mail? Many types and many classes. The group includes day laborers, clergymen, farmers, grocery clerks, boarding-house keepers, cooks, bank clerks, geologists, mill workers, vaudeville actors, teachers, artists, waiters, prisoners in state penitentiaries, janitors, probation officers, ball players.

And what do they study? It would be simpler to name the things they do not. Some study to aid themselves in their present work; some use the work as a stepping-stone to something better than the present holds; others take up the work for purely cultural reasons, while still others take this means of keeping up with modern developments in a given line or lines. English, education, romance languages, and history are the studies most often pursued for credit toward a degree, while business courses and those in engineering are most frequently in demand among the vocational group.

That the University of Wisconsin has made the greatest progress in the development of study through the extension method is evidenced by the table made up a short time ago of relative correspondence enrollments in various large colleges and universities. When the figures were compiled, Wisconsin led with a hundred or so over twenty thousand, while her nearest rivals in numbers, the University of Florida, and the University of Chicago, had, respectively, 5,604, and 5,575 correspondence pupils. Ohio State University followed with 4,900, while the more recent entrants in the field, the University of Kansas, the University of Missouri, and the University of Texas, had approximately one thousand each. In the remaining seven institutions offering such courses, and from whom figures were available, namely, Columbia University, Indiana University, Iowa State College, the University of Kentucky, and the Universities of Minnesota, North Dakota, and Oklahoma, the enrollment for extension work ran from eight hundred to two hundred forty pupils.

It may be safely concluded that educational opportunities are being eagerly grasped by men and women in many walks of life. In England, the universities are conducting classes in the great labor centers which serve much the same purpose as the extension work mentioned. Numerous American universities and normal schools are now conducting courses in neighboring cities but as yet these are largely patronized by teachers.

Probably a large part of the success attained in the University of Wisconsin's extension work is due to the much-talked-of personal touch which it is able to impart even to such a seemingly impersonal thing as a correspondence course. A student who enrolls for a course receives at once a mimeographed pamphlet of some two dozen sheets containing advice under various headings. Under *How to Get the Lasting Start* are these sentences: "Set aside a regular time for your study work and keep this work engagement as a standing engagement with yourself .... If you have to break any engagement do not, as a rule, break this. Get the study habit." And under *How to Get Acquainted With Your Instructor*: "To answer questions, to solve problems, to make formal recitation reports with regularity is doing well; to report also as concisely as is consistent with good results is better; but best and above all is to report so as to reveal yourself, your mind, your interests, your aspirations, through your work .... Your instructor can know your mind more intimately, if you will let him, than can a class instructor, as a rule, know the minds of his class students, and you will be surprised by what you will learn about the characteristics and qualities of your instructor."

Christmas in Old Time

By SIR WALTER SCOTT

HEAP on more wood!—the wind is chill;
But let it whistle as it will,
We'll keep our Christmas merry still.
Each age has deem'd the newborn year
The fittest time for festal cheer:
And well our Christian sires of old
Loved when the year its course had roll'd,
And brought blithe Christmas back again,
With all its hospitable train.
Domestic and religious rite
Gave honor to the holy night;
On Christmas Eve the bells were rung;
On Christmas Eve the mass was sung:
That only night in all the year,
Saw the stoled priest the chalice rear.
The damsel donn'd her kirtle sheen;
The hall was dress'd with holly green;
Forth to the wood did merry-men go,
To gather in the mistletoe.
Then open'd wide the baron's hall
To vassal, tenant, serf, and all;
Power laid his rod of rule aside,
And ceremony doff'd his pride.

The heir, with roses in his shoes,
That night might village partner choose;
The lord, underogating, share
The vulgar game of "post and pair."
All hail'd, with uncontroll'd delight
And general voice, the happy night,
That to the cottage, as the crown,
Brought tidings of Salvation down.

The fire, with well-dried logs supplied,
Went roaring up the chimney wide;
The huge hall-table's oaken face,
Scrubb'd till it shone, the day to grace,
Bore then upon its massive board
No mark to part the squire and lord.
Then was brought in the lusty brawn,
By old blue-coated serving-man;
Then the grim boar's head frown'd on high,
Crested with bays and rosemary.
Well can the green-garb'd ranger tell,
How, when, and where, the monster fell;
What dogs before his death he tore,
And all the baiting of the boar.
The wassail round, in good brown bowls,
Garnish'd with ribbons, blithely trowls.

The Town Meeting Comes to Fairview—By J. P. HOFFMAN

THE Northville Commercial Club meets once a year to elect officers and then carefully tucks in the covers and sleeps peacefully for twelve months.

However, in every community, no matter how evident are the signs of chronic lethargy, there are some who cling heroically to the optimistic hope of a revival of interest in civic welfare.

So in Northville a group of men met recently on their own initiative and appointed a committee to visit the neighboring town of Fairview to get pointers on instilling pep into an expiring body politic.

Reasons enough were evident for choosing Fairview as the object of study. Fairview has a state-wide reputation as the town that puts its community celebrations across in Class A style, and that gets first page space in the city press without a murder case as the subject.

Fairview is the town where the banker's wife plays bridge with the switchman's spouse, and the only qualification for singing in the choir is ability to sing.

Fairview has a Chautauqua, a baseball team, golf links, public playgrounds, rest rooms and boosters; but it has no Chautauqua Association, no Baseball Association, no Golf Association, no Playgrounds Association and no Booster Association. It has the Fairview Club.

By a fortunate coincidence, the Northville committee arrived in Fairview on the regular club meeting night. And the committee promptly got its first enlightening shock.

Instead of holding its meeting in the directors' room at the rear of the state bank, the Fairview Club met in the city auditorium and the s-r-o sign was hung out at 7:55. The committee got seats in the twenty-second row and wondered if President Coolidge was to be the guest of honor that night.

He wasn't. It was an average meeting lasting one hour and a quarter and no person talked longer than three minutes.

Long before adjournment the members of the Northville committee were sitting perilously near the front edge of their seats with their mouths open and their pulse rate nearing one hundred twenty. Shock followed shock.

Visions of the annual meetings of the Northville Commercial Club rose in their minds to be swept aside by the actual facts of the present meeting. But there was nothing spectacular. The Northville committeemen were the most excited persons in the auditorium.

A few minutes before the meeting adjourned, a gentleman rose and in a three-minute talk called attention to the fact that next month would mark the semi-centennial of the incorporation of Fairview as a village, and he proposed that the event be celebrated fittingly. The proposal met with favor and President Freeman named Dr. Pillby, Farmer Graham and Editor Denton as a committee to carry out the wishes of the club. And then the Northville committee received more shocks.

Dr. Pillby did not rise to remark that he was old in years and had traveled every road in the country a thousand times and had seen more storks than any other man living, and that his professional practice required all of his time and energy day and night, and that, therefore, he begged to be excused. No. He rose and said, "Thank you, Mr. President."

Farmer Graham did not remind the audience that his Shorthorn bull had tossed him over the fence two years ago and that the bones in his left leg had never been properly assembled and that, as a result, he could not get about well and therefore begged to be excused. He rose and said, "Thank you, Mr. President."

Editor Denton did not mention the price of print paper nor the typesetters' strike nor the multifarious duties of a country editor, nor the lack of appreciation of his editorial efforts. He, too, rose and said, "Thank you, Mr. President."

The Northville committee came back for the semi-centennial celebration and found that the event did credit to Fairview and was a benefit to the community. Every one of the numerous visitors was made to feel at home and welcome, and decided to come again. Merchants made new customers and the town new boosters.

When the Northville committee went into conference to set down its observations and formulate conclusions, there was but little difference of opinion. Facts were self-evident.

Where Uncle Sam counted 3,000 people in Fairview, he found 4,000 in Northville. He also found twenty-one associations in Northville, nineteen churches, fifteen clubs, four locals, and the town on the toboggan.

Every second man in Northville is either the president or first, second, third or fourth vice-president of something. Everybody is a colonel or general but nobody is in the ranks. Everybody is willing to give orders but there is no one left to execute them.

Northville paved a few of its streets last year and, on January first when the taxes fell due, the collective groans of the taxpayers brought an emergency relief train of nurses from headquarters.

There is no use of Northville kidnaping Freeman—it has Jones. No use talking Pillby, Graham and Denton—it has Medby, Brown and Byit.

But in Northville, when President Jones appoints Medby, Brown and Byit on a committee, do they rise and say, "Thank you, Mr. President"? They do not. They rise and inquire, "Who is the chairman?" If Medby is so honored, Brown and Byit resign. If Brown is designated as head, Medby and Byit won't serve. If Byit is chairman, Medby and Brown can't spare the time to act.

Northville has no baseball team because everybody wants to pitch. It has no band because everybody insists on being cornet soloist.

The nineteen ministers generally preach about the heathen of Siam or the lost tribes of Israel because both topics are considered safe.

Northville has civic anemia. But civic anemia is a result and not a cause. Civic anemia exists only where public spirit is absent. Northville lacks public spirit, Fairview has it. That's the difference. That's the essential difference between any live town and any dead one. And size makes no difference.

Scrooge Spends Christmas With Tiny Tim

Concluded from page 3

And perhaps it was the pleasure the good Spirit had in showing off this power of his, or else it was his own kind, generous, hearty nature, and his sympathy with all poor men, that led him straight to Scrooge's clerk's; for there he went, and took Scrooge with him, holding to his robe; and on the threshold of the door the Spirit smiled, and stopped to bless Bob Cratchit's dwelling with the sprinkling of his torch. Think of that! Bob had but fifteen "Bob" a-week himself; he pocketed on Saturdays but fifteen copies of his Christian name; and yet the Ghost of Christmas Present blessed his four-roomed house!

Then up rose Mrs. Cratchit, Cratchit's wife, dressed out but poorly in a twice-turned gown, but brave in ribbons, which are cheap and make a goodly show for sixpence; and she laid the cloth, assisted by Belinda Cratchit, second of her daughters, also brave in ribbons; while Master Peter Cratchit plunged a fork into the saucepan of potatoes, and getting the corners of his monstrous shirt collar (Bob's private property, conferred upon his son and heir in honour of the day) into his mouth, rejoiced to find himself so gallantly attired, and yearned to show his linen in the fashionable Parks. And now two smaller Cratchits, boy and girl, came tearing in, screaming that outside the baker's they had smelt the goose, and known it for their own; and basking in luxurious thoughts of sage and onion, these young Cratchits danced about the table, and exalted Master Peter Cratchit to the skies, while he (not proud, although his collar nearly choked him) blew the fire, until the slow potatoes bubbling up, knocked loudly at the saucepan-lid to be let out and peeled.

"What has ever got your precious father then?" said Mrs. Cratchit. "And your brother, Tiny Tim! And Martha warn't as late last Christmas Day by half-an-hour?"

"Here's Martha, mother!" said a girl, appearing as she spoke.

"Here's Martha, mother!" cried the two young Cratchits. "Hurrah! There's *such* a goose, Martha!"

"Why, bless your heart alive, my dear, how late you are!" said Mrs. Cratchit, kissing her a dozen times, and taking off her shawl and bonnet for her with officious zeal.

"We'd a deal of work to finish up last night," replied the girl, "and had to clear away this morning, mother!"

"Well! Never mind so long as you are come," said Mrs. Cratchit. "Sit ye down before the fire, my dear, and have a warm, Lord bless ye!"

"No, no! There's father coming," cried the two young Cratchits, who were everywhere at once. "Hide, Martha, hide!"

So Martha hid herself, and in came little Bob, the father, with at least three feet of comforter exclusive of the fringe, hanging down before him; and his threadbare clothes darned up and brushed, to look seasonable; and Tiny Tim upon his shoulder. Alas for Tiny Tim, he bore a little crutch, and had his limbs supported by an iron frame!

"Why, where's our Martha?" cried Bob Cratchit, looking round.

"Not coming," said Mrs. Cratchit.

"Not coming!" said Bob, with a sudden declension in his high spirits; for he had been Tim's blood horse all the way from church, and had come home rampant. "Not coming upon Christmas Day!"

Martha didn't like to see him disappointed, if it were only in joke; so she came out prematurely from behind the closet door, and ran into his arms, while the two young Cratchits hustled Tiny Tim, and bore him off into the wash-house, that he might hear the pudding singing in the copper.

"And how did little Tim behave?" asked Mrs. Cratchit, when she had rallied Bob on his credulity, and Bob had hugged his daughter to his heart's content.

"As good as gold," said Bob, "and better. Somehow he gets thoughtful, sitting by himself so much, and thinks the strangest things you ever heard. He told me, coming home, that he hoped the people saw him in the church, because he was a cripple, and it might be pleasant to them to remember upon Christmas Day, who made lame beggars walk, and blind men see."

* * * *

At last the dinner was all done, the cloth was cleared, the hearth swept, and the fire made up. The compound in the jug being tasted, and considered perfect, apples and oranges were put upon the table, and a shovel-full of chestnuts on the fire. Then all the Cratchit family drew round the hearth, in what Bob Cratchit called a circle, meaning half a one; and at Bob Cratchit's elbow stood the family display of glass. Two tumblers, and a custard-cup without a handle.

These held the hot stuff from the jug, however, as well as golden goblets would have done; and Bob served it out with beaming looks, while the chestnuts on the fire sputtered and cracked noisily. Then Bob proposed:

"A Merry Christmas to us all, my dears. God bless us!" Which all the family re-echoed.

"God bless us every one!" said Tiny Tim, the last of all.

* * * *

Yes! and the bedpost was his own. The bed was his own, the room was his own. Best and happiest of all, the Time before him was his own, to make amends in!

* * * *

"I don't know what day of the month it is!" said Scrooge. "I don't know how long I've been among the Spirits. I don't know anything. I'm quite a baby. Never mind. I don't care. I'd rather be a baby. Hallo! Whoop! Hallo here!"

He was checked in his transports by the churches ringing out the lustiest peals he had ever heard. Clash, clang, hammer; ding, dong, bell. Bell, dong, ding; hammer, clang, clash! Oh, glorious, glorious!

Running to the window, he opened it, and put out his head. No fog, no mist; clear, bright, jovial, stirring, cold; cold, piping for the blood to dance to; Golden sunlight; Heavenly sky; sweet fresh air; merry bells. Oh, glorious! Glorious!

"What's today?" cried Scrooge, calling downward to a boy in Sunday clothes, who perhaps had loitered in to look about him.

"Eh?" returned the boy, with all his might of wonder.

"What's today, my fine fellow?" said Scrooge.

"Today!" replied the boy. "Why, CHRISTMAS DAY."

"It's Christmas Day!" said Scrooge to himself. "I haven't missed it. The Spirits have done it all in one night. They can do anything they like. Of course they can. Of course they can. Hallo, my fine fellow!"

"Hallo!" returned the boy.

"Do you know the Poulterer's, in the next street but one, at the corner?" Scrooge inquired.

"I should hope I did," replied the lad.

"An intelligent boy!" said Scrooge. "A remarkable boy! Do you know whether they've sold the prize Turkey that was hanging up there?—Not the little prize Turkey: the big one?"

"What, the one as big as me?" returned the boy.

"What a delightful boy!" said Scrooge. "It's a pleasure to talk to him. Yes, my buck!"

"It's hanging there now," replied the boy.

"Is it?" said Scrooge. "Go and buy it."

"Walk-ER!" exclaimed the boy.

"No, no," said Scrooge, "I am in earnest. Go and buy it, and tell 'em to bring it here, that I may give them the direction where to take it. Come back with the man, and I'll give you a shilling. Come back with him in less than five minutes and I'll give you half-a-crown!"

The boy was off like a shot. He must have had a steady hand at a trigger who could have got a shot off half so fast.

"I'll send it to Bob Cratchit's!" whispered Scrooge, rubbing his hands, and splitting with a laugh. "He sha'n't know who sends it. It's twice the size of Tiny Tim. Joe Miller never made such a joke as sending it to Bob's will be!"

The hand in which he wrote the address was not a steady one, but write it he did, somehow, and went down-stairs to open the street door, ready for the coming of the poulterer's man. As he stood there, waiting his arrival, the knocker caught his eye.

"I shall love it, as long as I live!" cried Scrooge, patting it with his hand. "I scarcely ever looked at it before. What an honest expression it has in its face! It's a wonderful knocker!—Here's the Turkey. Hallo! Whoop! How are you! Merry Christmas!"

It *was* a Turkey! He never could have stood upon his legs, that bird. He would have snapped 'em short off in a minute, like sticks of sealing-wax.

* * * *

He dressed himself "all in his best," and at last got out into the streets. The people were by this time pouring forth, as he had seen them with the Ghost of Christmas Present; and walking with his hands behind him, Scrooge regarded every one with a delighted smile. He looked so irresistibly pleasant, in a word, that three or four good-humoured fellows said, "Good morning, sir! A merry Christmas to you!" And Scrooge said often afterwards, that of all the blithe sounds he had ever heard, those were the blithest in his ears.

* * * *

But he was early at the office next morning. Oh, he was early there. If he could only be there first, and catch Bob Cratchit coming late! That was the thing he had set his heart upon.

And he did it; yes, he did! The clock struck nine. No Bob. A quarter past. No Bob. He was full eighteen minutes and a half behind his time. Scrooge sat with his door wide open, that he might see him come into the Tank.

His hat was off, before he opened the door; his comforter too. He was on his stool in a jiffy; driving away with his pen, as if he were trying to overtake nine o'clock.

"Hallo!" growled Scrooge, in his accustomed voice, as near as he could feign it. "What do you mean by coming here at this time of day?"

"I am very sorry, sir," said Bob. "I *am* behind my time."

"You are?" repeated Scrooge. "Yes. I think you are. Step this way, sir, if you please."

"It's only once a year, sir," pleaded Bob, appearing from the Tank. "It shall not be repeated. I was making rather merry yesterday, sir."

"Now, I'll tell you what, my friend," said Scrooge, "I am not going to stand this sort of thing any longer. And therefore," he continued, leaping from his stool, and giving Bob such a dig in the waistcoat that he staggered back into the Tank again; "and therefore I am about to raise your salary!"

Bob trembled, and got a little nearer to the ruler. He had a momentary idea of knocking Scrooge down with it, holding him, and calling to the people in the court for help and a strait-waistcoat.

"A merry Christmas, Bob!" said Scrooge, with an earnestness that could not be mistaken, as he clapped him on the back. "A merrier Christmas, Bob, my good fellow, than I have given you for many a year! I'll raise your salary, and endeavour to assist your struggling family, and we will discuss your affairs this very afternoon, over a Christmas bowl of smoking bishop, Bob! Make up the fires, and buy another coal-scuttle before you dot another i, Bob Cratchit!"

Scrooge was better than his word. He did it all, and infinitely more; and to Tiny Tim, who did NOT die, he was a second father. He became as good a friend, as good a master, and as good a man, as the good old city knew, or any other good old city, town, or borough, in the good old world. Some people laughed to see the alteration in him, but he let them laugh, and little heeded them; for he was wise enough to know that nothing ever happened on this globe, for good, at which some people did not have their fill of laughter in the outset; and knowing that such as these would be blind anyway, he thought it quite as well that they should wrinkle up their eyes in grins, as have the malady in less attractive forms. His own heart laughed; and that was quite enough for him.

He had no further intercourse with Spirits, but lived upon the Total Abstinence Principle, ever afterwards; and it was always said of him, that he knew how to keep Christmas well, if any man alive possessed the knowledge. May that be truly said of us, and all of us! And so, as Tiny Tim observed, God bless Us, Every One!

Valley Forge—Gethsemane of Revolution

Where Washington's Ragged Soldiers Starved and Froze, But Fought On

By AARON HARDY ULM

IN THE Revolutionary War, Valley Forge was the Gethsemane of that conflict. After the defeat of the Colonial forces at Brandywine and Germantown, during the late summer and autumn of 1777, both Washington and Sir William Howe, the latter being the British commander at that time, looked for suitable places at which to spend the winter.

Howe then held Philadelphia, the country's first city, and there he let his forces settle down for a season of quiet, gaiety and comfort. They seem to have had a very good time. The record, a not very proud one, is that the Philadelphians who remained in the city, where

"Washington's Headquarters," Valley Forge, Pennsylvania.

the Liberty Bell just a year and a half before had proclaimed the Declaration of Independence, did little to keep the invaders from enjoying the season to the full. In fact, Tory sentiment probably was predominant among the remaining residents of the city. And even others who were not Tory could not always resist the temptation represented by the good money spent freely by the invaders.

One of Washington's biggest trials was to keep good Americans from selling supplies to the British forces in preference to their own army which could pay for them only in script of doubtful value. In Philadelphia, the season teemed with balls and dinners and fêtes in which natives joined freely with the invaders.

Meantime, Washington's ragged soldiers starved and froze at Valley Forge only twenty miles away. For in selecting and organizing his winter quarters Washington could give little thought to the requirements of comfort. He had to be in position to watch the opposing forces and to keep them from making raids in the rich farming section west of Philadelphia.

So Washington's rendezvous was at Valley Forge, which was nothing but a group of wooded hills where what is known as the Valley stream pours into the Schuylkill River. It took its name from the fact that a forge stood nearby. There was not even a village as at present. There were good farmhouses in the vicinity but only enough of them to supply quarters for Washington and other high officers.

The writer recently visited the place, which once was remote from lines of easy travel but now on account of good roads is easily accessible. It lies only a few miles from the old Lancaster pike section of the Lincoln Highway, from which motorists may turn and quickly view the most romantic and most tragic spot associated with the history of the War of Independence.

Valley Forge remains very much as it was in Revolutionary times. Though not far from a large city, its environs have not been greatly marred by "progress." There is a village population of a hundred or two, and substantial farmhouses built of stone by the original Quaker and Welsh settlers still are in the majority.

Although it had nothing to do with the selection of the place as a military camping ground, Washington might have hunted far and wide without finding a better expression of natural beauty than was and still is there. The army lived among the trees on rolling hills which rise gracefully from a deep and shadowy ravine wherein General Headquarters were situated. Most of the trees still stand, and here and there among them one finds the marks of forts and trenches which were set up for purposes of defense. These are about the only specific relics of the encampment which remain. Though several hundred and probably several thousand troops died and were buried there, the grave of only one of them is known or is marked!

When the troops, much heartened by events which occurred while they held out at Valley Forge, took to the field again the camp ground passed back to its private owners and was handed down from generation to generation. The State of Pennsylvania acquired it and made of it a memorial park, which is dotted with monuments and markers. The residence in which Washington lived and exercised command stands in the ravine near where the old forge was operated. The house then used as an army bakery is now a part of a hotel structure. Scattered through the woods are replicas of the log huts in which officers and men of the line lived. They are tiny structures of logs and mud. The Federal Government has had nothing to do with preserving the historic spot, but has erected several monuments there, among them being a magnificent memorial arch in honor of George Washington.

Surviving records do not show exactly how many were encamped there. The number probably fluctuated between five and eleven thousand. It comprised the greater part of the Revolutionary Army at that time.

Many evidently spent part of the winter at home on furloughs, some no doubt deserted, and many died. New recruits were added to the force, however, especially during the latter part of the Valley Forge experience.

John Marshall, afterward Chief Justice of the United States Supreme Court, who was a lieutenant there, wrote from Valley Forge in midwinter:

"Although the total of the army exceeds 17,000 men, the present rank and file amounts to only 5,012." On February 1, 1778, there were 3,989 of these unfit for duty for want of clothes. Sixteen days later, Washington wrote to Governor Clinton of New York:

"For some days past there has been little less than a famine in camp. A part of the army has been a week without any kind of flesh, and the rest three or four days. Naked and starved as they are, we cannot but admire the incomparable patience and fidelity of the soldiery that they have not been, ere this, excited by their sufferings to general mutiny and desertion."

On the day following, John Laurence wrote:

"The unfortunate soldiers are in want of everything; they have neither coats, hats, shirts, nor shoes; their feet and legs freeze till they become black, and it is often necessary to amputate them."

Washington's orderly book contains the following entry: "The commander-in-chief offers a reward of $10 to any person who shall by 9 o'clock on Monday morning produce the best substitute for shoes, made of raw hides."

Many of the men had to rip their fragmentary

Reproduction of an army hospital.

blankets into strips with which to bind their feet for walking in the snow. Some had to plod through the snow in bare feet, often leaving blood-stained imprints behind them.

While the log huts, chinked with mud, gave protection against wind and rain, blankets were so scarce that the men often would have to sit up all night around a log fire to keep from freezing.

"The whole army," wrote General Wayne, "is sick and crawling with vermin."

Yet the body of the soldiers remained loyal to Washington. Conspiracies against the commander developed among some of the officers and in Congress. Tradition says that Washington resolved to resign. When he announced this to the officers close to him, someone asked:

"How about your penknife?"

This knife, which is now on public exhibition in Alexandria, Virginia, had been given to Washington when a youth by his mother with the injunction that he never undertake anything without seeing it through.

When reminded of it, the commander-in-chief took back his words about resigning.

It was Washington's example which held the little army together.

The pay schedule ran as follows: Colonels, $75; captains, $40; sergeants, $10, and privates, $6.33 a month.

Even when paid, which was not regularly, they had to accept Continental currency, which was of little purchasing value.

Yet Valley Forge was not all gloom and suffering during the period of about six months spent there by Washington's troops.

Camp sutlers managed to drum up many luxuries for those who could buy them. The higher officers and their staffs lived in farmhouses which still are commodious. The wives of some, among them Martha Washington, joined their husbands and spent part of the period there. Foreign officers, like Lafayette, added liveliness to the experience.

Nor were the sufferings of the officers and men of the line a continuous experience. There was firewood a-plenty, and little to do except gather it. There was guard duty, of course, and entrenchments to erect, for they knew not when Howe's forces might come out and attack them. But the Britons and Hessians seem to have had too good a time in Philadelphia, where, as one wrote, they were supplied with all that was necessary and superfluous, for them to bother the ragged Continentals a few miles away.

Since he could get little relief from Congress, which was sitting at York a hundred miles away, Washington boldly decided to "live on the country." Foraging parties regularly scoured the rich farming region for food, which they seized when found, paying for it in script, which, by the way, never was redeemed. Farmers caught taking supplies into Philadelphia for sale to the enemy were dealt with severely. There is a record of a court-martial having ordered that 250 lashes be applied to the back of one offender.

It was at Valley Forge, as spring came on and eased their sufferings, that the most cheering word of the entire Revolution, next to that of Yorktown, reached the army. It was that France had decided to take the side of the Colonies. This news was duly celebrated in the camp. Washington's order outlining the celebration survives.

"It having pleased the Almighty Ruler of the universe," it says, "to defend the course of the United States, and finally raise up a most powerful friend among the princes of the earth, to establish our Liberty and Independence upon a lasting foundation, it becomes us to set apart a day for gratefully acknowledging the Divine goodness, and celebrating the important event which we owe to His Divine interposition."

He directed that the celebration begin in the early morning with suitable discourses by the chaplains, then that there be firing of cannon, followed by a running fire of infantry, with the climax in the form of huzzas by all the army for the King of France, for friendly European powers, and "the American States." This happened on May 2.

On May 8 there was a council of war preparatory to resuming fighting operations. Washington reported that the Continental forces then comprised 15,000, not including cavalry and artillery. Of the number 11,800 were at Valley Forge.

Valley Forge was probably the turning point in the war. But for Washington and the remnants of the army which stayed with him holding on there against terrific odds, France would not have come to our aid and discouragement among the people probably would have brought the contest quickly to an end, favorably to the British.

Tradition records that Washington, who was not given to religious fervor, was found one night in the woods of Valley Forge upon his knees in prayer.

This tradition is now enshrined by the Washington Memorial Chapel, probably the most attractive monument which has been erected at Valley Forge. It stands outside the park on private land and was erected by popular contributions. To the Reverend W. Herbert Burt, a local Episcopal clergyman, this memorial is due, for it was he who in the face of much discouragement realized the dream of a suitable mark of Christian America's reverence for the spot where George Washington wrestled in prayer with the God of Nations.

The vicinity of Valley Forge is reminiscent of Revolutionary times. The village of Paoli remains much as it was a hundred and fifty years ago. At Easttown one still may see the birthplace and old home of General Anthony Wayne who was Washington's main aide during the Valley Forge experience. Several churches, like the Great Valley Baptist Church which is more than two centuries old, remain as they were in Washington's time.

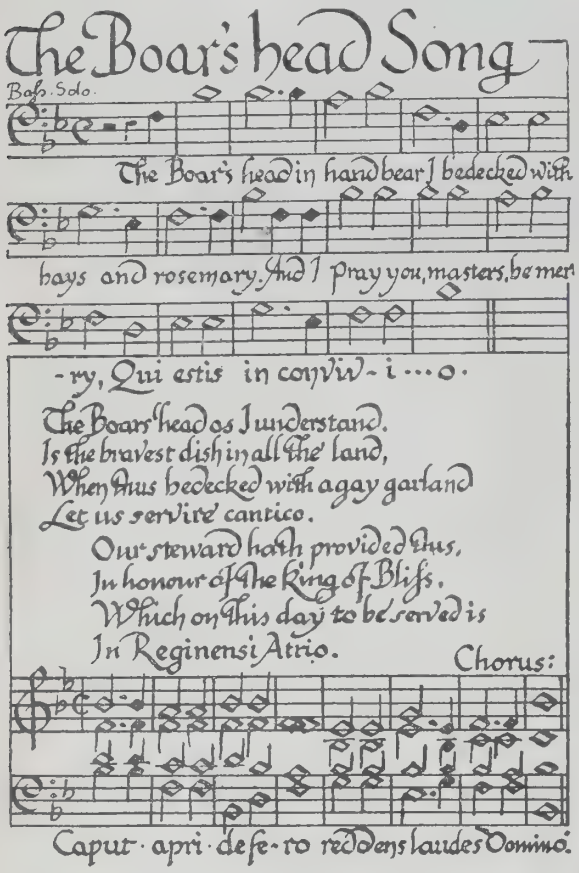
Christmas in Old London—A Reverie of Merry Yuletides

Concluded from page 10

merchant sea-captain Thomas Coram in the year 1739 for the care and welfare of "exposed and deserted poor children." In the chapel this Christmas morn seated on each side of the organ—given and often played upon by George Frederick Handel, great benefactor to this hospital—are grouped the children in their quaint costume, the girls in high mob caps, singing as with the voice of cherubs. Thackeray used to attend here, and the glasses of his spectacles would grow dim as he



The Boar's head Song
Bas. Solo.
The Boar's head in hand bear I bedecked with
bays and rosemary. And I pray you, masters, be mer
-ry, Qui estis in convivi - i ... o.
The Boar's head as I understand.
Is the bravest dish in all the land,
When thus bedecked with a gay garland
Let us servite cantico.
Our steward hath provided this,
In honour of the King of Bliss.
Which on this day to be served is
In Reginensi Atrio.
Chorus:
Caput apri defero reddens laudes Domino.

This song was sung as the principal dish—the boar's head—was brought into the banquetting hall.

listened to their singing. We read in his ballad of Eliza Davis, ascribed by him to one policeman X:

"Praps you know the Fondling Chapel,
Vere the little children sings:
(Lor! I likes to hear on Sundies
Them there pooty little things!)

In the evening I could go to one of the big hotels, where there will be gorgeous high jinks, much laughing and quaffing and chaffing; music and dancing; all of which would not come home to my heart. For, surely, at Christmastide—on Christmas Eve and on Christmas Day—East, West, *HOME'S* best? At home I will bide, with my own kin and a friend or two. We shall have a very merry Christmas, and shall not forget to sing "Auld Lang Syne," drinking to the good health of all absent friends, among them the many we have in America.

A Merry Christmas and a Happy New Year to them and to you all!

An early Victorian home scene which was used as a headpiece for Christmas stationery.

Mussolini and Italy's Remaking

Concluded from page 6

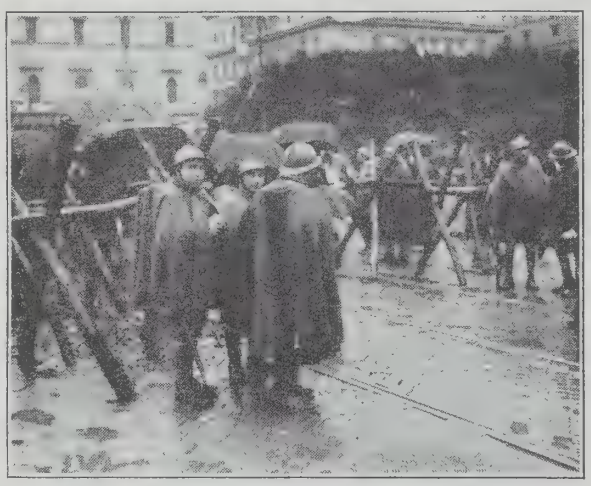
crime was mercifully averted, probably forever. Italy is not on the eve of a second March on Rome. The Fascisti will neither bloodily suppress their enemies nor be bloodily suppressed by them. They are engaged in a desperate attempt to prove to the Italian people that their movement in spite of coming in like a lion will remain as a lamb, and that though they will abate no jot of their claim to power and respect, they have abandoned the system of ruling by fear.

I will endeavor in conclusion to give the actual situation as it exists and to indicate one or two probable developments.

The compositors of Italian newspapers should be able to set up the words "normality," "normalization," "pacification," "collaboration," and so on, in their sleep. Little else has appeared in the columns for the past six months. They are all absolutely meaningless, or rather Government and Opposition mean, when they use them, two entirely different and contradictory things. The Opposition means restoration of a real democratic system, the political and legal equality of Italian citizens, the confinement of arms to the army and navy, and a Parliament properly elected. The Fascisti mean the acknowledgment of their supremacy. It is impossible for Fascismo to "normalize," for if it did it would be finished. If, for example, the Blackshirt army, the militia were disbanded, the whole organization would fall to the ground. The Fascisti know it, and cling to their militia. The Opposition know it, and call for its execution. Between the two sides there is a great gulf fixed, dug by two years of insults, over which there can be no bridge. It is only fair to say that justice is now rigorously meted out to all offenders impartially insofar as the central authority can insure it, and that not even the murder of a Fascist deputy by a madman was made the excuse for an outbreak of violence. But the outlook of the two sides remains irreconcilable, and the better conditions are the symptom of a summer's truce: they are not the foundation for a permanent peace.

One by one during the past six months the allies of Fascismo have fallen away from it. The pro-Fascist sections have been unable to prevent directly or indirectly hostile resolutions being passed by the associations of ex-service and disabled men, which have refused to participate in the birthday celebrations of the March on Rome; by the conferences of the Italian bar, the Italian press, and, lastly, the Liberal party. These bodies and their resolutions are of secondary importance in themselves, because they do not represent directly any great numbers, and because within each there is a pro-government group of varying strength. But the important point is that they would never have dared to pass such resolutions, had they not believed they were striking at the losing side, and speaking for the majority of the 38,000,000 people, who, on Mussolini's own estimate, are those not attached to any definite political party. Mussolini is known to contemplate another election whether on the present system, or upon one changed to suit the altered situation of Fascismo. Under whatever system, however, the election will be something of a test, because the unborn, the moribund, and the dead will not again vote at this election as they did at the last.

It must not be supposed that Fascismo is altogether a



Rome, October 28, 1922. The Facta government declared a state of siege against the Fascisti, and barricaded the Tiber Bridges. The king refused to sign the proclamation, and thus averted Civil War.

spent force, for it has an enormous asset in the divisions which exist among its opponents. The latter include the Socialists, the Social-Democrats, the Populars, the Liberal Constitutionalists, the Republicans, and a number of minor groups; in fact, all the old Italian parties except the Communists. Their views are widely different, except upon the one point of their determination to defeat Fascismo. This measure of agreement is sufficient to enable them to form a joint Opposition committee, and to issue common manifestos in favor of such general principles as the restoration of individual liberty, and the abolition of the militia. But I doubt very much whether there is enough common ground among them to allow of the presentation of one single list of candidates at a general election, and if they present themselves separately, the Opposition vote will be split into five or six fragments, whereas the Fascista vote will always be solid. It is still more doubtful whether, in the event of electoral success, they could form a homogeneous government; and it is absolutely certain that Mussolini could not pass quietly from his present eminence into opposition. All these considerations give many people occasion to pause, and to ask themselves, whether, if the Fascisti continue to keep quiet, their maintenance in power is not preferable to the trouble inevitably consequent upon their fall. It is for this reason that I remarked that the political future is extremely dark and uncertain. So delicate a political barometer as the Vatican, for example, has recently taken every opportunity of disassociating itself from both sides, and of slapping each impartially.

It should not be thought from any of the foregoing that Italy is on the eve of a counter-revolution, of a countermarch on Rome by Opposition forces, or anything of that kind. On the contrary, in the material sense, the country is outwardly perfectly quiet and hard at work. All that I have intended to convey is that Fascismo has in the moral sense failed to make good; that the moral evils inherent in its system are ineradicable; that it is widely unpopular, and sooner or later must go. I do not know whether it will go quietly or not, but one thing is certain, that the Italian people are tired of blast and bombast and will turn in that political direction whence it thinks will come liberty and peace.

"Cobler Turned Courtier"—A 17th Century Chap Book

The pictures in the tayle reprinted herewith are a literal reproduction from a Chap Book of the seventeenth century, one of the most famous of the Chap Books. The earliest book on this subject is the "Cobler turned Courtier, being a Pleasant Humor between K. Henry 8th and a Cobler" 1680, quarto.

These Chap Books were hawked about the streets by Chap men, and were the precursers of the Annual which followed later.

The
History of the
KING and the COBLER

"It was the custom of King Henry 8 to walk late in the night into the City disguised, to observe how the constables and watch performed their duty; not only in guarding the City gates but also diligently watching the inner part of the city, that they might prevent those dangers and casualties that happens to great and populous Cities, in the night time. This he did oftentimes, without the least discovery who he was, returning home to Whitehall early in the morning.—Now on his return home through the Strand he took notice of a certain Cobler who was always up at work whistling and singing

every morning, so he resolved to see him, in order that he immediately knocks the heel of shoe by hitting it against the Stones."

The King gives the shoe to be mended, and tells the cobbler to bring it to him at the opposite inn when done. The cobbler obeys. The King gives him liquor and they hobnob in the most familiar manner; the King telling him his name is Henry Tudor; that he belongs to the Court and should be very glad to see the cobbler whenever he liked to call. In fact, they became so friendly, that the cobbler would insist on the King's going over to his cellar, and trying some wonderful brown ale and a Cheshire cheese.

The King departs and the cobbler sadly misses him. At length the cobbler's wife persuades him to pay his friend a visit.

On his arrival at Whitehall, he asked for Henry Tudor, and by the King's express command was immediately ushered into his presence. This very much embarrassed him as will be seen from the illustration:

The King, however, at once disguises himself, follows his friend and takes him to his own cellar, as thus:

He then reveals himself, and later gives the "cobler" a pension of forty marks yearly, with the freedom of his cellar, and made him "one of his courtiers." The last picture shows how the "cobler" deported himself as a courtier:

Life and the Endocrine Organs

CLAUDE Bernard (1813-1878), the illustrious French physiologist, in the year 1849, proved that the blood which enters the liver does not contain sugar, while the blood after leaving that organ and entering the *hepatic vein* is charged with it. Bernard also demonstrated that a division of a certain nerve, known to physiologists as the *pneumogastric nerve*, when divided, caused the formation of sugar in the liver to be interrupted. He also discovered that if the floor of the fourth ventricle of the brain is punctured the disease known as *diabetes* results. According to Bernard, the function of the liver is to store sugar as glycogen and liberate it into the blood which supplies the tissues in accordance with their requirements. The process by which the cells of the liver give up sugar to the blood was named *"internal secretion"* by Bernard. At the present time this term is used in a more limited sense. In its modern significance it refers to any process of secretion, of some specific chemical material, by some organ into the blood, provided that this secretion is essential to the maintenance of the proper functioning of some other organ. An *internal secretion*, then, is a definite chemical material which is manufactured in one organ for the purpose of maintaining some other organ in a normal and healthy state of activity.

An important and highly interesting discussion on "Internal Secretions" by Professor P. T. Herring, of the University of St. Andrews, appeared in the April number (1924) of *Science Progress*. (We are indebted to this journal for the photographs here reproduced.) Dr. Herring, in his historical survey of this subject, leads up to the main discussion by very interesting references to the beliefs of primitive man. We quote the following from his article: "The belief is common among primitive peoples that by eating the flesh of man or animal the partaker acquires the physical, moral and intellectual qualities which characterized them when living. Courage, the most desirable of virtues, was more particularly identified with the heart, and the custom arose of eating the heart of a courageous foe, man or animal, to acquire this virtue. Closely akin is the practice among some savages of transferring their blood one to another in the belief that they are thereby made members of the same family, endowed with the same attributes."

Professor Herring also mentions that Sir James Frazer has come to the conclusion that in the time of the Roman poet Ovid more knowledge about the circulation of the blood was extant than has been generally supposed. In substantiation of this assertion Frazer has cited that passage from Ovid in which "Medea restores the aged Aeson to youth by a method which may be aptly compared to the intravenous injection of modern times. After many incantations and purifications, Medea pierces the neck of Aeson with a dagger and pours into the wound a decoction containing, among other ingredients, the liver of a long-lived deer and the head of a crow that had outlived nine generations of men." It appears, therefore, that the dreams of the alchemists concerning an *elixir of life* and the more recent attempts of Brown-Séquard, Serge Voronoff, Retterer, and Steinach, to rejuvenate the human body have their common sources in a desire which is as old as history.

This field of scientific investigation has proved fertile soil for charlatans and exploiters of the human race. "Homeopathic Magic," as Sir James Frazer designates this mode of converting a natural human desire into a lucrative means of sustenance, is not a new "profession" in view of the evidence presented by Ovid. It is not the purpose of this article to discuss this matter. The intent is rather to throw some light upon the nature and functions of the endocrine organs found in the human body. These organs are of utmost importance to life, normality, and health.

The following physiological structures or organs are of the endocrine type: certain cells in the mucous membrane of parts of the alimentary canal, the *suprarenal capsules*, *pituitary body*, *pineal body*, the *gonads* of the male and female, the *thyroids*, the *parathyroids*, and the *islets of Langerhans of* the *pancreas*. It is frequently a fact that technical terms are absorbed into the general vocabulary and employed without the possession of specific knowledge concerning their significance. For this reason it has been deemed advisable to point out some of the salient and distinguishing features of these terms in the following brief discussion. The importance of the endocrine organs to human life will also be incidentally revealed. The *suprarenal capsules* are located in the upper end of each kidney. They are flattened cellular structures of a highly complex nature. Their size varies from one to two inches in diameter. The term *"adrenal"* is sometimes used to designate these organic structures. The crystalline substance known as *adrenaline* is obtained from the *suprarenal extract*. The *internal secretion* of the *suprarenal capsules* exercises an important influence on the circulatory and muscular system.

The *pituitary body* is a small, oval, reddish gray, vascular (fluid carrying) body which is located at the base of the brain. According to Cushing (1912), the *pituitary hormone* (internal secretion), in excessive quantities produces gigantism whereas an insufficient supply results in obesity. Whenever diminished activity of the *pituitary body* takes place in early life then atrophy (lack of growth) of the gonads is generally observed. In the male this retarded action of the pituitary body is accompanied by the appearance of many feminine characteristics in the body.

The *pineal body* is also located in the brain. This small organ is conical in shape. Its color is a reddish gray.

The *gonads* are the reproductive glands of the male and female.

Close to the *larynx* (organ of voice) we find the highly important gland known technically as the *thyroid*. Its secretion is of great significance in *metabolism*. This process (metabolism) involves not only the building up (*anabolism*) of protoplasm but also its destruction (*katabolism*) through decomposition and oxidation accompanied by the liberation of energy. By the process of metabolism energy is provided for the vital processes and activities and new material is assimilated to repair the waste. If the functions of the *thyroid* are disturbed such diseases as *cretinism*, *myxoedema*, and *exophthalmic goiter* (Basedow's disease) result. The term *cretinism* refers to inherited idiocy accompanied by physical degeneracy and deformity. The disease known as *myxoedema* produces what is technically called a *cretinoid* appearance of the face. It also results in a retardation of the speech and dullness of intellect. *Exophthalmia* is accompanied by a protrusion of the eyeball generally so pronounced that the eyelids cannot cover it.

PROFESSOR J. J. R. MACLEOD,

Awarded the Nobel Prize for Medicine cojointly with Dr. Banting because of his important work in the preparation of *insulin*. Dr. Macleod is professor of physiology and vice-dean of the Faculty of Medicine at the University of Toronto.

DR. F. G. BANTING,

The scientist who, in conjunction with Dr. C. H. Best, discovered *insulin* in 1923, while working in the physiological department of the University of Toronto under the direction of Professor Macleod. Dr. Banting cojointly with Professor Macleod was awarded the 1923 Nobel Prize for Medicine.

Near or imbedded in the *thyroid glands* we find the *parathyroids* which are composed of masses of cells arranged in columnar fashion. This organ is endocrine in its nature but its precise functions are not, as yet, definitely determined.

The structure known as the *"islets of Langerhans"* is located in the large gland called the *pancreas* which discharges into the intestine. The *islets of Langerhans* is an endocrine organ generating an *internal secretion* or *hormone*. It was first shown by Laguesse (1893) that this particular hormone played an important rôle in metabolism. The *pancreas* proper generates the *pancreatic juice*, a clear alkaline secretion, which acts on the food previously acted upon by the *gastric* juice. The *pancreatic* juice is the most important digestive juice because it is capable of acting upon all of the three types of food substance, that is, *proteids*, *carbohydrates*, and *fats*. The *pancreas* is an elongated gland placed transversely in the abdomen behind the stomach. By a long series of investigations culminating in the discovery of *insulin*, in 1923, by Drs. Banting, Best, Collip, and Macleod, it was finally demonstrated that the "islets of Langerhans" secrets the anti-diabetic hormone. This endocrine structure received its name because it is diffused, like little islands, through the *pancreas*. The *islets of Langerhans* are the regulators of the sugar supply in the body. The mal-functioning of these small organs is the cause of the disease known as *diabetes*. This disease is attended with an excessive and persistent discharge of urine. In its most serious form, *diabetes mellitus*, progressive emaciation sets in, the urine shows the presence of sugar, and excessive thirst and hunger are in evidence. Professor J. P. McMurrick (University of Toronto), in *Science Progress* (April, 1924), has told the "Story of Insulin." We epitomize a portion of his account as follows:

Drs. F. G. Banting and C. H. Best laid the foundation of the discovery of *insulin* by showing that the intravenous (within a vein or veins) administration of the extract of the "islets" produced an invariable and rapid decrease in the amount of blood sugar in animals afflicted with diabetes. As first produced the extract contained irritant substances which were finally removed by Dr. J. B. Collip, of the University of Alberta. The *harmone insulin* was thus produced in a sufficiently pure form for use as a definite agent in the treatment of diabetes which previously had invariably proved fatal.

The co-operative work of Professor J. J. R. Macleod and his associates proved of exceptional value in the consummation of this discovery.

In the fifteenth and sixteenth centuries the thumb was the fashionable "ring-finger."

A third of the automobiles in the United States are owned by farmers. Eighty-five per cent of the farmers of the Middle West own cars, while fifty per cent of the Atlantic Coast farmers are owners.

C. F. Braden, of Eola, Texas, is authority for the statement that turkeys will not eat corn when they can obtain haws, grapes, acorns and other wild fruits and bugs. Mr. Braden raises hundreds of turkeys for the market that never saw corn, wheat, barley or other grain but grew and fattened on weeds and bugs.

Dry weather and lack of food has driven bears to seek the rural sections of Oregon. Orchards are raided and food stolen from campers.

Seventy years ago aluminum sold for $7 an ounce and was advertised as "silver from clay."

The city of Natchitoches, Louisiana, is a good roads town. In addition to the Louisiana Purchase Highway, now under way, there are three other national highways converging in this city. They are the Jefferson Highway from Winnipeg to New Orleans, the Lone Star Trail from Jacksonville to Los Angeles and the Lake to the Gulf Road from Chicago to Lake Charles.

Aerial photography has become so important in recent years that dredging companies and others whose work requires drawings are using photographs taken from the air instead of blue prints and maps.

As the sun sinks to the horizon, its rays strike us on the slant shining through myriads of particles of dust and water vapor, breaking them into their component parts and coloring them. This makes for sunsets of brilliant coloring.

Extensive limitation of the Danish army and navy to the extent of practical disarmament is proposed in a bill introduced in the Rigsdad by the Danish Minister of Defense. The bill would abolish general enlistment for military service and all soldiers would return to civil life. All forts would be dismantled and the material and land would be used for other government purposes or sold.

Our word "ship" is derived from the Dutch word "schip." The Dutch mariner used to be known as a "schipper," and to this our sea captains owe their nickname of "skipper."

The ordinary house fly makes 330 wing beats a second.

"The power to predict the future is not so valuable or so truly prophetic as the power to see what the future ought to be and to help create it." —*Bishop McDowell.*

The game of poker was known to the Persians thousands of years ago.

"The International Jew," a four-volume series on the Jewish Question, may be obtained from The Dearborn Publishing Company, Dearborn, Michigan. This set includes: "The International Jew," Vol. 1, 235 pages; "Jewish Activities in the United States," Vol. II, 256 pages; "Jewish Influence on American Life," Vol. III, 256 pages; "Aspects of Jewish Power in the United States," Vol. IV, 246 pages. The price of these volumes is twenty-five cents each; the complete set, four volumes, one dollar.

The late Herr Krupp, the German armament magnate, a maker of death-dealing devices himself, had a horror of the word "death," and he would not permit the word to be mentioned in his presence.

Jews in Palestine are going back to the old Hebrew names. Golman is becoming Zahabi; Silverman is becoming Kaspi; Blumberg becomes Parchi; and Goldman becomes Haklai. Names like Sapiro, Cohen and Levy remain unchanged: they are already Hebrew.

Gold is produced in nineteen counties of the State of North Carolina.

"Horses must go!" is now the slogan of Chicago, except on a few specified streets where they will not interfere with traffic.

With two fingers you can lift a girder of duralumin metal strong enough to hold six men.

Each of the world's peoples have their own standards of modesty. Chinese women wear trousers and believe the skirt immodest. Certain Mohammedan women of the Sahaha region will tear off their last garment to cover their faces upon the approach of a stranger. The Breton maiden wears a close-fitting hat to prevent her hair from showing.

Upsetting the plans of the Democrats and Republicans in the recent election, a woman's party appeared in Sunbeam, Colorado, and succeeded in electing two constables and one justice of the peace. The names of the three women were written in on the ballot.

The Federal Supreme Court holds that a taxpayer, as a taxpayer, cannot maintain an action to restrain a government officer from performing his official acts. A Boston woman attempted to restrain the Secretary of the Treasury from paying out certain funds under the Sheppard-Towner Maternity Act, suing as a taxpayer and attacking the validity of the act.

The word Dad originated from the Irish word for father, "Daid."

The genuine ruby is obtained from the mineral known as corundum, being the pure crystalline variety of corundum. Emery, the abrasive, is an impure form of corundum.

Put a piece of mignonette and a rose together in a vase. Within half an hour each will make a perfume "gas attack" upon the other. In the battle of odors both flowers will lose their freshness and scent. Separate them and each will revive at once.

"In California out of thirty-five rabbis that we investigated, we found only three who were handling their wines without irregularity," said Federal Prohibition Director Sam Rutter at San Francisco.

Certain African tribes smelt iron ore in furnaces which bear a remarkable resemblance to the great blast furnaces of the civilized world, except they are in miniature and crude in their operation. In both instances the stacks are shaped alike and a blast of air is driven in to increase the heat.

Despite his huge bulk, an elephant can glide along as quietly as a cat or a fox in the dense jungles which constitute his home, according to a recently returned hunter.

Bauxite takes its name from the French hamlet of Baux, ten miles east of Arles, on the lower Rhone.

When Sir Isaac Newton was writing his "Principia" he lived on a scanty allowance of bread and water and vegetable diet.

The will of Joseph Conrad showed that the author left an estate valued at about $100,000.

There are only about 120,000 ostriches in all Africa.

Captain Robert Dollar, owner of the Dollar Steamship Company, is said to be the "Cappy Ricks" of Peter B. Kyne's stories.

The eagle was first used on American money in 1795 when Congress authorized the issuance of a gold coin worth $10.

A collection of coins identified as dating back to the time of Cenwulf, a Mercian king who ruled about A. D. 800, was discovered in a cave near Peakland, Derbyshire, England, recently.

The original manuscript of "Kidnaped," by Robert Louis Stevenson, brought $10,000 at an auction in New York City recently.

An old silver mine has been rediscovered on Catalina Island and two carloads of ore, realizing $6,500 to each carload, have been shipped to San Francisco.

Remains of an Indian village estimated to be 2,000 years old have been found near The Dalles, Oregon, buried under more than twelve feet of stratified deposits.

Yuletide Annuals Our Grandsires Read

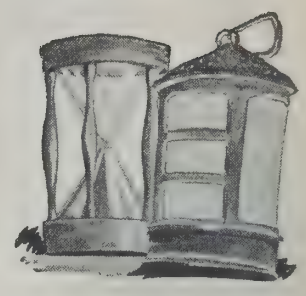
Intense Sentimentality in Picture and Print Relished Like the Roast Goose and Mince Pie



By THOMAS L. MASSON

THE Christmas and New Year's annuals and gift books of the past!—how little we realize what they have meant to their own readers. England still keeps up the practice to some extent, and the London Christmas Annuals, with their coated paper and their resplendent colored illustrations, are still to be seen here. But inquiry among the agents betrays the fact that their yearly sale is steadily declining.

In the older, more leisurely days how different! Everybody looked forward to the annuals and gift books.

The annuals issued for adults were ornate affairs, embellished with wonderful steel engravings, some of them printed in colors, contributed to by the best writers, replete with gems of beauty and with stories renowned for virtue triumphant.

Here, for example, is the opening of a story which appeared in "The Youth's Sketch Book" for 1836, entitled "The Tortoise-Shell Kitten." It gives us a perfect picture of the home life of that day:

> "One dark winter's evening, George and Charles, and two of their cousins, were seated around a cheerful fire, amusing themselves by playing forfeits. On one side of the fire was seated their father in his great arm chair, and before him were placed a table and his desk."

From the same issue of this gift book, which was published in Philadelphia by one William Ash and "illustrated with 8 beautiful engravings" is a delightful description of the grandmother of that day. It is written by Mrs. Child, and is entitled "The Happy Grandmother."

> "Dame Trueman lived in a very pleasant village, in old England. The cottage which she hired of her richer neighbor was small and humble. She had four orphan grandchildren to support, and she was obliged to labor hard for her daily bread. Yet Dame Trueman was a very happy woman. From her earliest childhood she had always been in the habit of preferring the comfort of others to her own."

Some of the engravings were so elaborate as to be almost painful in their execution. In an old number of Cassel's Illustrated Almanac, which was about the same size as *Chatterbox*, is a much detailed woodcut of three young ladies of the period, with their heads pressed together. Two of them are seated on a sofa, as close as their crinolines will permit, and the other is bending over them. This picture takes up the full page except for a small space beneath for the following "poem":

A Telling Passage—
Pianissimo
What's your secret, pretty lispers,
Prating is with you a passion,
Could I catch your little whispers,
They would run in much this fashion—

"She said, we said, he said, they said,
I said, she said, we said, he said.
Bell said, Mary said and May said—"
Stay now; tell me first what she said!

The early Victorian family circle indulging in its yearly feast of reason and flow of soul.

If we really wish to get an idea of how comfortable we are today as compared with the past, let us take a glance at the Comic Almanac of George Cruikshank which was issued continuously for about nineteen years, and which was undoubtedly one of the most successful humorous annuals of the period. From the volume for 1836 the opening verses are:

> Chilblains sore on all your toes;
> Icicles hang from your nose;
> Rheumatis in all your limbs;
> Noddle full of aches and whims;
> Chaps upon your hands and lips
> And lumbago in your hips;
> To your bed you shiv'ring creep
> There to freeze but not to sleep.

It is the function of the humorist to depict misfortune and make light of it. Thus from the humorous annuals of the past we get a much better idea of what they had to endure from the cold than from formal histories. There were no steam-heated apartments or hot-air furnaces in those days!

It is interesting to note that two of the steady contributors to this Cruickshank Almanac, with their names on the title-page, were the brothers Mayhew. To Henry Mayhew is given the credit for starting *Punch* and contributing its title, but more than this, it was he who originated the famous Punch Almanac, which is to this day as good as ever—perhaps the only single example of a survival over a period of seventy years. *Punch* was started in 1841. The circulation was about 6,000 when Mayhew thought of the almanac. The first issue ran the circulation up to 90,000 copies. "The Almanac," says Spielmann, "became at once the talk of the day; everybody had read it, and a contemporary declared that its cuts 'would elicit laughter from toothache, and render gout oblivious of his toe.'"

This almanac naturally had many imitators; it is undoubtedly the pioneer of the Christmas numbers of today. The London *Times* declared of it that it "commences the winter season with us, and continues the tradition of Charles Dickens by retaining much of the fine old hearty flavor which the great novelist imparted to it—that jovial, tender, charitable, roast-goose spirit that exhales from it, the Spirits of Christmas Present and Christmas Past."

The annuals themselves, as a definite group of yearly gift books, began in England about 1823. They were clean and wholesome, and reeked with sentimentality as a rule; they were exported to this country from England at first but from about 1830 they had many imitators here. The original object in issuing them seems to have been threefold. They came as a kind of spontaneous outburst of good feeling induced by the season; they were profitable, and they did much to offset the bad books, of which there were a considerable number.

Christmas, as a universal celebration, undoubtedly got its start with the advent of the printing press. The true Noël begins to appear in the fifteenth-century manuscripts, but not until the sixteenth century was it in full vogue. Here also is a curious fact, that the first Christmas cards—verses, sentiments, and so forth—were written by clerks—and yet they say there is not sentiment in business! The great poets, of course, contributed. But it was printing that made it possible. Christmas and New Year's thus became symbolized in words. Before typography and printing it must be remembered that the illuminated manuscripts were very beautiful. I myself have handled all the first editions of the Bible, including the Gutenberg, the "He" and "She," the "Breeches," and six or seven others, and have not yet recovered from the thrill; several of them weighed each at least twenty pounds. Here again I am off my subject, only, I may say in an aside to, I trust, the interested reader, that all this material is so fascinating in its entirety that it is hard to leave off no matter where one begins. As far as these Christmas annuals are concerned, I know of no one who has made a collection of them. I can conceive of no more interesting reading for a desert island. It was from the use of wood that those wonderful woodcuts came which grace the pages of those annuals. *Chatterbox*, which I read continuously as a boy, was full of them. The old files of *Chatterbox* are as fascinating as ever, although the edition of today is merely "just another."

Chatterbox was first published in England in 1868, as a substitute for vicious and unclean literature and an offset to the dime novel. It is refreshing to record that its success was very great. It sold at wholesale from 75 to 90 cents, apparently according to the size of a particular issue. In 1878, Dana Estes, of Boston, seeing its possibilities, imported as many copies as he could buy and sold them here readily. He was honest about it, calling the publisher's attention to what he was doing and proposed to him (James Johnston) to send over the plates and authorize an American edition. This proposition was not at first acceded to, and in 1879 a second edition was published, but in 1880 Mr. Johnston, according to Estes, assigned the latter all his rights and title in America. From then on *Chatterbox* flourished in this country, the wholesale price was largely reduced and the English proprietor received royalties amounting to about $5,000 per annum. All the way from 50,000 to 100,000 copies were sold here each year. Later several suits were the outcome for infringement. Among others was the *Frank Leslie Chatterbox*. The great fact was established, however, that the young people would flock to a pictorial annual in large numbers, which contained spotless material.

Compared with the flood of annuals that preceded it *Chatterbox* was late in our history, as was also *Oliver Optic's Annual*, and a number of others. Oliver Optic, in my opinion, performed a valuable service in his boys' books. His annual was printed in very large type and did not compare in interest with *Chatterbox*. In the eighties *The Young Folks Annual* was perhaps the best, and its pages were full of contributions by Ernest Ingersoll, Hezekiah Butterworth, Arthur Gilman, Amanda B. Harris and Mrs. Rose Hawthorne Lathrop. These annuals mentioned, in size, were about 7½ by 9½, whereas the earlier ones, to which I shall now refer, were much smaller, about 4¼ by 6 inches. Perhaps I should here interpolate and say that if this account seems rambling, that is precisely the effect one gets from a survey of these annuals over a period.

They were all essentially yearly visitors. They were all intended to be messengers of joy. They strove also to convey beauty. They depicted beautiful women, women with rounded clear cheeks, fully clothed, and who exhaled the very quintessence of domesticity, yet with more charm than one can say who has not fallen a victim to them. There were reigning belles, there were "bevys," there were whole albums of notable women, members of the aristocracy, beauties of the day. Indeed, I defy any regular red-blooded member of the male sex of today to look over the pages of many of these old Annuals, with those full-page fair women, curls and crinolines, Gainsborough hats and cupid lips, without getting more thrills than he can get today out of listening to any girl over the radio, or even in looking out of his window.

They certainly should come back to us, if only to revive the spirit of real romance.

In stating this, it must not be overlooked that the

(Concluded on page 13)

What the Year 1924 Did to Make History

Survey of World's Political Happenings—America's Confidence in the Future

By HARRY PENCE

TWELVE months ago in these columns, it was necessary to characterize 1923 as a period of "Disagreements and Misunderstandings." It was not a pleasant task to chronicle details confirming the painful fact.

France had taken possession of the Ruhr district, the great industrial heart of Germany, in the futile effort to exact reparations by force. Germany exhausted her already crippled resources and all but wrecked her political structure in an equally futile "passive resistance." Italy precipitated a crisis by the bombardment of Corfu and the imposition of an onerous and unreasonable penalty on Greece. Spain submitted to rule by a military dictator who corrected everything but the abuses which brought him into power. The Turk threw off the yoke of European guardianship, which had industrial exploitation as its chief motive, thus exposing the impotence of that school of elder statesmen who still dominated the diplomatic world.

But a year has passed and while it has not brought all that the perennial optimists dared to hope for its developments, observers who have usually read the signs of the times aright declare the general outlook to be brighter than at any time since the fateful outbreak of 1914.

The French occupation of the Ruhr was condemned by many as unjust and illegal. While French policy had many defenders, the conviction grew that Premier Raymond Poincaré was intent upon two objectives, only one of which was humanly possible. He was determined to wring money or its equivalent from Germany, while, at the same time, he skillfully obstructed Germany in its struggle toward economic rehabilitation.

Through Prime Minister Bonar Law, the British Government had sought to dissuade Poincaré from his "direct action," but refrained from condemnation or effort to employ other influence than polite dissent. On several subsequent occasions Prime Minister Law and his successor, Stanley Baldwin, sought to re-establish the same friendly and advisory relations which had been so easy to maintain in the face of a common danger, but Poincaré became increasingly unreceptive to such overtures.

The Dawes Report

AN ALMOST universal demand for an impartial investigation grew steadily during 1923, but Poincaré refused to consider any action that abridged the power of the Reparations Commission. He agreed to a review of the situation that would remain entirely within strict limitations and even assented to American participation in such an inquiry under such conditions.

The United States promptly and emphatically refused to take part in a certain fiasco.

As the year drew to a close Poincaré became less obdurate. Things had happened that discouraged him. The Ruhr occupation was not paying its cost. French finances were going from bad to worse and the necessity for higher taxes, always unpopular in every country, loomed as a certainty.

Moreover, the time for the regular French parliamentary elections was approaching, while in England events were shaping up disturbingly. The political reaction of one country upon another is no new factor in European progress.

England was suffering from widespread unemployment. The ministry became convinced that protective tariffs on imports would revive lagging industry. But what all Europe knew and what, for some unexplained reasons, the Conservative ministry temporarily lost sight of, was that England's traditional policy of free trade was too deeply rooted to be reversed in a parliamentary campaign of a few weeks.

This English development could not fail to impress Poincaré, for it promised, as eventually happened, to bring into power the British Labor party, the rank and file of which was in sympathy with the elements in France that opposed such drastic phases of the Ruhr policy as the effort to establish a Rhineland republic separate from Germany. Although they were officially denounced as unpatriotic, the French opposition supported the Ruhr adventure as a means of exacting payment. They realized that it could not be made the means of preventing the economic recovery of that country, for only an economically vigorous—and therefore potentially aggressive—Germany could redeem her treaty obligations.

Moved by these and other considerations Poincaré receded from his original position and assented to an impartial, international investigation of Germany's ability to pay and the Reparations Commission invited two commissions to undertake the researches.

It was agreed that the United States should be represented on the first and most important of these committees and that an American should be its head.

Late in December, a few weeks after the adverse election in England, General Charles G. Dawes, banker, prominent in the purchase of supplies during the war, former Controller of the Treasury of the United States and later the Director of the first National Budget Commission, was selected for this post.

His committee was empowered to determine what sums Germany could pay annually and to devise and recommend plans whereby the restrictions on that country could be lightened and her recovery facilitated.

The two committees began their work in January of this year and on April 9 they made their reports.

That of the second, or so-called McKenna, committee can be briefly disposed of. Its duty was to inquire into large exportations of capital from Germany, the belief at the time of its appointment being that Germany's industrial and financial chieftains had thus evaded their share of the national burden. It reported only an estimate of this withdrawal of national wealth with no determined facts as to its ownership, the circumstances of its exportation or its possible utility for reparations purposes. This capital, the committee believed, would return if and when lured by prospects of security and profits.

The findings of the first, or Dawes, committee were more specific and momentous. The resources of the German republic were comprehensively appraised, the commercial and industrial wealth analyzed and a plan formulated whereby, with adequate pledges as security, aid might be given Germany in working out her own salvation.

Space does not permit a digest of the plan. It is intricate and provides for an intricate system of administration. It depends upon international agreements as to interpretations but, in the main, it declares for the stabilization of German national finances, a brief relief from heavy payments, the non-interference in German affairs by the creditor nations except through the agencies of the administrators of the plan who, thereby, superseded to some extent the Reparations Commission. It fixed the amount which, once restored to a semblance of normality, Germany could pay each normal year, but was not empowered to determine the number of years it should remain in effect. The gross amount of Germany's penalty, therefore, remains a matter of adjustment through the Reparations Commission. The report, by clear implication, declared against the occupation of the Ruhr for any considerable time after the plan was ratified and put into effect.

The Reparations Commission promptly approved the reports and transmitted them to the countries directly interested.

Further action had to await parliamentary elections in Germany on May 4 and France on May 11. The German election gave the reactionaries and obstructionists a favorable opportunity to declare against all foreign influences and the various blocs of monarchists, imperialists and irreconcilables united to defeat the plan.

In France the result was the reverse. Poincaré and his extremists were decisively defeated. The opposition party not having attained a majority an anti-Poincaré coalition became necessary which had on its program also the elimination of President Millerand, who, contrary to French traditions, had become an active partisan in the campaign.

The leader of this coalition, Edouard Herriot, extreme liberal, refused to accept the premiership from President Millerand or to support anyone whom the President should appoint.

When the Chamber of Deputies met early in June, Millerand made a brave effort to save himself but on June 11 he resigned and on June 13 Gaston Doumergue was elected in his stead. The next day Herriot became Premier of France, thus bringing into power in that country a party closely akin in principles to the Labor government of Great Britain.

A week after the change of administration at Paris Premier Herriot visited Prime Minister Ramsay MacDonald in London and the two were able to agree on certain preliminaries that removed obstacles threatening the success of the formal conference of Allied Premiers slated for the middle of July at which the acceptance or rejection of the Dawes Plan was to be determined upon.

America was invited to participate in this conference and President Coolidge named Frank B. Kellogg, United States Ambassador to Great Britain, and James A. Logan as our representatives.

This London Conference began on July 16 and on August 16 a pact was signed providing, subject to the ratifications of the home governments, for the earliest possible inauguration of the plan.

The most substantial concession was the agreement of France to begin the withdrawal of military forces from the Ruhr and to complete the evacuation within a year.

Britain's Political Vicissitudes

THE fight then shifted to the German Reichstag where the opposition had votes enough to defeat the plan. But when the final test came, realizing that should Germany spurn the opportunity the act would crystallize the opinion of the world against her, even the leaders voted to ratify the agreement. Thus action took place on August 29.

The plan also provided for a loan of $200,000,000 to Germany for the stabilization of her finances and on October 10 an association of bankers agreed to facilitate this loan. A few days later this was oversubscribed in every country in which portions of it were offered. The American quota of $110,000,000 was immediately absorbed.

The installation of the plan, however, did not allay discord in Germany. Chancellor Marx undertook to reorganize his cabinet but the disgruntled reactionaries refused to co-operate, so he brought about a dissolution of the Reichstag and a call for new elections on December 7.

The early returns of this election, made public as these lines are written, indicate a defeat of the reactionaries and the success of the liberal element which have been valiant for a political as well as an economic stabilization of Germany.

Reference has been made to the political vicissitudes of Great Britain. Late in 1923, Prime Minister Baldwin risked his continuance in office on an election upon the issue of a protective tariff. He lost, although his party returned more members of the House of Commons than either the Liberals or the Laborites.

The country, however, voted strongly against protection and this made the position of the Conservative untenable. The Labor party stood second in popular vote and representation in Commons, but the Liberals held a balance of power. On January 23, MacDonald, the first Labor Prime Minister of Great Britain, accepted the invitation to organize a new government and announced his ministry.

This was not only the first Labor ministry but the first that represented a minority and depended for its continuance in office upon the sufferance of an essentially antagonistic party. It was, therefore, impossible for Prime Minister MacDonald to make any move to carry out the extreme articles in the program of his party and when he took office it was predicted that his eventual fall would come from the defection in his own ranks. The radical element would demand that efforts be made to put the socialistic program into effect.

There was discontent but MacDonald, assuming charge of foreign affairs, succeeded where his predecessors had failed in bringing about an accord with France. He recognized Russia and a number of his cabinet members won commendation for governmental efficiency.

There is general agreement that MacDonald was able to promote the success of the London Conference more than his predecessor could have done and his appearance at the assembly of the League of Nations was an important event of the year.

The end came in October and then not on account of any issue of importance. A radical editor had been arrested for publishing allegedly seditious matter but Attorney-General Sir Patrick Hastings had withdrawn prosecution of the case. An investigation of his conduct with an implied censure was proposed in Commons and the Prime Minister declared its passage should constitute an expression of want of confidence in the entire ministry. On October 8 the resolution passed and the following day Prime Minister MacDonald offered his resignation, effective after an election, should the country fail to support him and his party.

The new elections took place on October 29. In the midst of the campaign a sensational letter was made public and the issues of the contest were overshadowed by the reputed effort of a prominent member of the Soviet government at Moscow to stir up communistic and revolutionary activity in London.

Concerning the League of Nations

THE Conservatives would most probably have won despite the Zinoviev letter, but its entrance into the campaign rendered the Labor defeat overwhelming. Although the party increased its popular vote it lost more than forty of its members and the Conservatives elected nearly two-thirds of the new House of Commons. (The Zinoviev letter, though denounced as a forgery by its alleged author, was accepted as genuine by the MacDonald government, by the people, and later, upon investigation, by the Baldwin government.) On November 7, Stanley Baldwin became Prime Minister, having occupied the post twice in one year.

Concerning the League of Nations much difference of opinion exists in this country, but the actual developments of the year cannot be ignored and some of the facts are incontrovertible.

The League lost prestige last year because it did not assert itself more firmly in the controversy between Italy and Greece. On the other hand, this very impotence disarmed some of the American criticism that the League was a dangerous super-state.

But in the meantime the incidental side activities of the League were progressing, generally beneficently. Austria continued her financial recovery, Hungary passed under the economic guardianship of the League and several smaller issues were settled without resort to force.

The assembly of the League met in Geneva on the first of September. The allied nations had just concluded the London pact validating the Dawes Plan and during the sessions of the conference the Premier of France and the Prime Minister of Great Britain, both the heads of parties, friendly to the League, agreed to attend and address this assembly.

The speech of Ramsay MacDonald on September 4 was the most complete and candid statement yet publicly made of the accepted British policy in European affairs, especially in regard to her participation in future conflict on the Continent. Premier Herriot's reply voiced the French point of view with equal candor and made clear the issues upon which, under existing conditions, further agreement is impossible. This clarification of the question clears the way for the elimination of some of the possible causes of future discord.

The assembly devoted most of the 1924 session to the consideration of an international agreement for further disarmament, for international arbitration and mutual pledges of security.

The work was ultimately embodied in a protocol which, if ratified by the member nations, will make the League much more efficient than it has ever been.

The protocol calls for an international conference on arbitration and disarmament to be held in Geneva on June 15, 1925, if, prior to June 1, the majority of the permanent members of the Council of the League (Great Britain, France, Italy and Japan) and at least ten other countries ratify the pact.

The United States and all other non-member nations have been invited to ratify the protocol and participate in the conference.

Opinion has not crystallized sufficiently to enable even the most venturesome of political prophets to risk a prediction as to the probable outcome of this endeavor

President Calles Discusses Mexico's Future

Economic Ills Principal Cause of Former Troubles

Not the People's Love of Revolutionary Uprisings

By E. L. M'COLGIN

PLUTARCO ELIAS CALLES

PRESIDENT Plutarco Elias Calles of Mexico, who assumed office December 1, discussed his country's problems with me several weeks ago in New York while en route from Germany, where he had taken medical treatment, to Mexico City.

Although Americans have become reconciled to the failure of most of their presidents to get needed programs adopted, they seem to expect Mexican executives to be miracle workers. Therefore, the man who will wrestle with Mexico's internal problems and also attempt to satisfy a critical though friendly Uncle Sam, becomes forthwith an interesting personage.

Señor Calles is a stern-visaged, burly man of middle age who gives the impression that he has no other thought than to improve the condition of the Mexican people. Rough and blunt, lacking perhaps the flexibility and capacity for adjustments of his comrade and late chief President Obregon, the new president gives an impression of strength and integrity which inspires confidence.

There is nothing of the courtier about Calles. While he seemed to be perfectly aware of the complexity of his new task, he did not hesitate to declare that Mexico must now be allowed to work out her destiny as a democratic state:

> "All foreigners who abide by the principle of not exacting rights, privileges or one-sided consideration, and who respect the sovereignty and the laws of our country have traditionally been, and will continue to be, received as brothers."

Calles is a native of Sonora, the northwestern state of Mexico, which adjoins Arizona. It is an agricultural, mining, and industrial community with much the same relation to Mexican affairs that Ohio, Michigan, or Wisconsin has to American politics.

A graduate of the normal school in Hermosillo, the capital of Sonora, Calles became a public school teacher in the port city of Guayamas. Here he married a lady of the well-known Chancon family and became city treasurer.

Mexico Wants More Farmers

CALLES later removed to Frontera, opposite Douglas, Arizona, where the governor of Sonora appointed him *jefe politico*, the prefect or sub-governor in charge of the county. While there, Calles settled a big strike of the native copper mine and smelter workers. The American managers of Mexican operations were paying for a twelve-hour day but one-half or one-third as much as Mexicans across the line in Arizona were paid for a shorter day. The inequality was adjusted.

Calles served in the Madero revolution of 1910 as an "emergency" soldier with the rank of major. When General Huerta ousted Madero and attempted to become dictator, Calles opposed him in arms and became the military governor of Northern Sonora. His intimate in these affairs was Alvaro Obregon, a planter and merchant, destined to precede him as president.

Calles was civil governor of Sonora from 1916 to 1920. He is said to have persuaded the copper workers to accept wage reductions, to enable the American operators to resume work. This does not suggest the unreasonable radical. He developed new irrigation projects and doubled the agricultural production of Sonora in two years. Public and private subscriptions were obtained for a technical school in Hermosillo, where two thousand young men and women are now being taught engineering, mining, printing, shoemaking, domestic science and other useful vocations.

When Obregon rid Mexico of Carranza and later was elected president, Calles was summoned to Mexico City to serve as chief of the cabinet.

President Calles stressed to me that *all these and other national uprisings in Mexico were caused by economic ills and not because of the revolutionary habit.* The quick, decisive manner in which all the people helped suppress the Huerta outbreak of 1924 supports Calles' contention.

Mexico expelled the Spanish régime and later Juarez disposed of the French and Maximilian in an endeavor to do what Calles is committed to further. It is in effect the division of the great feudal estates among the peasants. The present strength of France comes from the stability of her numerous small farmers who own the land they till. Mexico cannot become a strong nation until a big independent farming and landowning population is developed.

Aside from the quickly extinguished manorial holdings of the patroons in New York State, the United States has never had to deal with the problem that has always bedeviled Mexico. The American Congress quickly put an end to county-wide estates and forestalled incipient rebellion.

Americans, therefore, usually overlook the salient differences between the settlement of the United States and Mexico. Here the English and other colonists from North Europe came to till the soil as they had done overseas. Few Indians were encountered and they were either killed or driven out of the country. However, Mexico today has ten times as many full-blooded Indians as there ever were in the United States.

Spain simply seized Mexico for the exploitation of its mines. No attempt was made to colonize Spanish peasants upon the soil of Mexico. The Indians were retained to slave in the mines and other looting operations of the conquerors. Usually the Spaniards married Indian women as few Spanish women came out; today six and one-half million of the population are mestizos or mixed breeds. About five and one-half million are pure Indians. The balance of the population, about three million, is of pure European stock. Practically all of the twelve million mestizos and Indians are illiterate. Government is further complicated by the fact that sixty-three languages and dialects are spoken, fifty-two of them by Indians.

For more than four hundred years, less than ten thousand families owned all the land in Mexico, whose area is one-fourth that of the United States. It has been only about one hundred years since the 25,000 square mile estate given Hernando Cortes, the conqueror, was disentailed.

However, the spirit of the Aztecs, the dominant Indian element, survived their condition of peonage and a universal demand for fair conditions has always been manifest. The mass of the Mexicans are proud of their Indian blood and resent being termed Spanish as that reminds them of their conquerors and persecutors.

Death and Poverty Reign

ALL of the presidents of Mexico, including Calles, have been mestizos.

Aside from the business men, most Mexicans seem indifferent to copying American or European culture, preferring to maintain their own traditions while seeking security and comfort. However, more Mexicans attend American universities than any other Latin-American people.

It will require generations under the most favorable circumstances to lift the Mexican peons to exuberant initiative. America had to fight a bloody, expensive war to free a smaller number of Negroes than these Mexican peons, and it required fifty years for the South to become reconstructed.

Although there are some very healthy districts, the high, arid country requires special precautions against disease, pneumonia being the most feared. *The death rate of Mexico is the highest in the New World.* Dire poverty of the masses, undernourishment, insanitary conditions and lack of medical facilities accentuate climatic conditions.

Calles expressed his attitude toward these outstanding factors by saying: "I believe that Mexico cannot be a great country as long as it has twelve million human beings who have been in perpetual slavery. To lift the moral and economic level of these people I believe to be a work of reconstruction that will benefit not only Mexico, but all other countries with which Mexico has relations, because it is not to be doubted that with the awakening of the spirit of industry among these unfortunate people the volume of business will be greatly multiplied.

"You may have the absolute certainty that with the ideals we are seeking, the betterments we are trying to effect will not be an obstacle either to the development of industry or commerce, but will serve to strengthen the spiritual ties that must unite all countries in the world."

A Huge Foreign Debt

IT IS doubtless true that Calles in his work will be more or less afflicted with what Roosevelt termed the "lunatic fringe" of radicals and socialist advocates. But he seems to be well endowed with common sense and his record as governor of Sonora is as constructive as that of any governor in the United States.

We of the United States cannot be proud of some records our compatriots have made in Mexico. One cause of socialism in Mexico was the Yucatan sisal monopoly, which was made possible by the assistance of Wall Street bankers who shared in extorting high prices for binder twine from American farmers.

Mexico's foreign debt aggregates half a billion dollars plus about *half as much unpaid interest* accumulated since the first revolution. Last year the government planned to resume payment of interest but the Huerta revolt emptied the cash drawer of the treasury. The old loans were obtained from international bankers in New York, London, Berlin, Amsterdam, and Paris, including such houses as Speyer, Ladenburg, Thalman, Bleischroeder, and Rothschild.

The international bankers now insist that before new loans are made a Federal Reserve Bank must be established and a majority of the stock of this bank must be owned by French bankers who plan to borrow the capital from their New York colleagues. This would give foreigners control of the economic affairs of Mexico, and France would have a pretext for challenging the Monroe Doctrine whenever her bankers got into a dispute with Mexico. France invaded Mexico and set up Maximilian while we were preoccupied with the Civil War because Juarez suspended interest payments on the debt for several years to devote the money to urgent reconstruction work.

In 1914 General Huerta sold several million dollars of unauthorized bonds to English speculators who were warned by Mexican citizens that the bonds were not valid. English recognition of Mexico has been impeded by the demands of the bankers that these bonds be paid.

However, Americans should in all fairness recall that the Association of Foreign Bondholders of London has declared that no Central American country has treated bondholders as the State of Mississippi has done. Mississippi, long ago, borrowed money abroad with which to establish two banks. When the banks failed the state repudiated the bonds. The State of North Carolina has felt justified in refusing to pay bonds issued by the carpetbag government of reconstruction days, which bonds remind one of those General Huerta sold abroad. The essential difference is that the United States can't be coerced by foreign government. It is possible that if Americans should ever become weakened European politicians would cheerfully join in forcing us to pay the hundreds of millions the Rothschilds paid for repudiated Confederate bonds.

Mexico's Appeal

MEXICO is not nearly so rich in taxation sources as many people suppose. Silver-mining states do not make a country prosperous, as our own experience in the United States shows. Other than the oil wells, the Mexican Government has no special revenue sources. And twelve million illiterate, impoverished peons are a liability rather than an asset from the taxation viewpoint.

There are gratifying indications that important foreign interests, those that do not dabble in Mexican politics, have faith in the Mexican Government. For example, the English-owned Mexican Railway Company, operating between Vera Cruz and Mexico, is electrifying its mountain division and also building a new short line or cut-off between Mexico City and the rapidly growing city of Tampico. The Southern Pacific Railway is spending fourteen million dollars, gold, upon a new connecting link with Mexico City. Furthermore, the government-operated National Railways of Mexico which are soon to be returned to the operating company are in better physical condition than they ever were. Railway experts say Mexicans have a knack that makes them the best locomotive drivers in America.

America, after the World War, lent money prodigiously to new and old European states, to avert in those countries just such social and political perils that now menace Mexico, which is also a war-worn country. Government and private funds have been poured into Russian relief although the Soviets continue to spread their doctrine here. It would be farsighted statesmanship, and quite in accord with our traditional interest in humanity and democratic government, to help Mexico to consolidate her present gains. We cannot afford to have on our southern frontier a nation suffering from the ills that have ravaged Mexico. If Calles is left to the mercies of international bankers, he may be able to make but desultory progress and disappoint his unfortunate people and the expectations of the United States.

New Englanders Who Come From Afric Isles

Making Bedford Whale Fishers Out of Cape Verders

By ALBERT ERNEST JENKS
Professor of Anthropology, University of Minnesota.
Copyright, 1924, by Albert Ernest Jenks.

A whaler's map of the Cape Verde Archipelago.

THE story of American immigration, when written in other form than that of lifeless statistics, has many strange chapters. Perhaps there is no more curious chapter than that of the people from the Cape Verde Archipelago. From first to last the history of this people in America is part and parcel of the romance of New Bedford whale fishing. Whaling vessels brought the first Cape Verders to America, and for them that means New Bedford. Even today, though they have gone to many other places, they feel that New Bedford is their real home here.

In August, 1924, I was in New Bedford at the time the whaling bark *Wanderer* was outfitting for what was commonly said would be the last whaling voyage from that port. With no little interest I went over the veteran whaler. The vessel was forty-eight years old and had been constantly used in whale fishing. The new "try-works" being built on deck—two immense iron kettles built in above brick fire boxes—the cramped quarters of the captain and the crew, the barrels in the hold where the whale oil was to be stored, harpoons, guns and knives being put in order, were all of interest. Patrons of motion pictures who saw the whaling movie, "Down to the Sea in Ships," are familiar with the *Wanderer,* as it was this ship which did the active whaling shown in the film.

The first mate of the *Wanderer,* J. A. Gomes, a Cape Verder, told me that when they sailed they would go directly to the Island of Brava in the Cape Verde Archipelago for a "green crew"—leaving New Bedford with only enough men to sail the bark across the Atlantic.

This plan of getting a Cape Verde crew was the continuation of the practice of many New Bedford whalers for a couple of generations.

During the days the *Wanderer* was outfitting, the Cape Verde packet *Matthew S. Greer*—dramatically called in the headlines of the press "The Ship of Blasted Hopes"—lay at anchor in the stream, having on board what was said would be the last group of alien immigrants who would come from Cape Verde Islands to America. Under orders from Washington, the twenty-three natives were not permitted to land in America, and subsequently were sent back to the Islands, as under the new immigration law there is no separate Cape Verde quota. Other vessels in the Islands were cabled by their agents not to start for America with immigrants, as it would be impossible for them to be landed.

August 26, there appeared in the press of New Bedford this statement:

"The famous old whaling bark *Wanderer* which left this port Monday on a whaling cruise went ashore in today's gale on the Middle Ground Shoal and will be a total loss. The crew was saved."

Thus the curtain was rung down simultaneously in New Bedford on as thrilling and perilous a romance as ever made a city prosperous and deservedly famous, and on the immigration of one of our unique, though, in numbers, lesser immigrant peoples.

America has no other immigrant group who formally bears so many names as the Cape Verde group. None are names of derision. The group leaders prefer the name "Cape Verder." Formerly they spoke of themselves as "Portuguese"—and this designation is, in a sense, correct, because the Cape Verde Archipelago has been a Portuguese possession during the four and one-half centuries the Cape Verders have been in the making. Today the term is less used, because other groups of peoples from Portuguese possessions who are their neighbors in New England object to Cape Verders in America being classed as "Portuguese." This objection is most common on the part of the "Western Island Portuguese"—especially those from the Azores. Sometimes the Cape Verders are called "The Other Island Portuguese"—to distinguish them from those of the Western Islands. The name most commonly applied to them in New Bedford and along Cape Cod is "Bravas." This term is used by those who know them intimately and favorably as seamen (sailors, mates, captains, whalers, stewards, firemen), as mill hands in cotton, cordage, iron and machine industries, as employes on the cranberry bogs, as trucksters and small farmers, as independent fishermen, both scale and shell, as dock hands, and as house and personal servants. This name is correctly applied to most of the Cape Verders in America, as the majority of them come from the island of Brava—though it is next to the smallest of the inhabited islands of the Archipelago. Some of them object to the designation "Brava," because, as they say, "it does not sound well," the word in Portuguese meaning "wild."

In the regular reports of the United States Commissioner of Immigration, Cape Verde immigrants are included under the two designations "African (black)" and "Portuguese," depending on their color. The United States census includes them under the heading "Atlantic Islanders"—in two city classifications adding a footnote that the term includes a definite number of Cape Verders. The United States Immigration Commission in 1911 designated them "black Portuguese," "dark Portuguese," "dark-skinned Portuguese," but more commonly it employs the term "Bravas." The Massachusetts state census blankets them under the term "Portuguese, including island possessions." Recruiting officers of the United States Army classify them as "Colored," if Negro kinship is evident.

Maritime America has long been interested in the Cape Verde Islands. Especially has her acquaintance been intimate during the hundred years of successful whaling in the Atlantic Ocean. The accompanying rare map of the Archipelago, with additions made seventy-three years ago, was photographed from the copy preserved by the Dartmouth Historical Society in its New Bedford Museum building. The map is one of the exhibits in the whaling museum. It is a whaler's map of the Islands. The Archipelago consists of fourteen islands, the ten largest of which are peopled. The total area is 1,475 square miles, or a little larger than the area of Rhode Island.

From this small island-area there has been transplanted in recent years to the identical New England area where, during the second quarter of the seventeenth century, the Pilgrims and Puritans planted the seeds of our nation, a people in numbers equal to the earliest colonists.

It is from the island of Fogo that most of the Cape Verders in the United States, who are not from Brava, come. Fogo lies above Brava and is separated from it by a channel eight and one-half miles wide. On this island is a volcano, Pico do Cano, rising to a height of 8,800 feet, the highest point in the Archipelago. It is very like Vesuvius in formation and after an eruption in 1680 caused the name of the island to be changed from St. Philip to "Fire" Island. In spite of the fact that it has no interior springs, but only a few along the northern coast, Fogo produces coffee, sugar, tobacco, indigo, and millet which are of small trade value. The recent years of rain failure have been very severe on the people of Fogo. A New Bedford Fogoite, who returned this last spring from two and a quarter years' stay there, told me that during that time, due to lack of water, he did not see a single domestic animal.

Brava contains only twenty-three square miles, but is justly called the Paradise of the Archipelago. It is better watered than the other islands and is the most healthful. The land in the interior is divided into small holdings and intensively cultivated, having a population of 418 persons to the square mile. This is two and one-half times the density in any of the other islands. There is a great desire on the part of the people of Brava to own land. This desire, and the extreme density of population, were important factors in the continued Brava migration to America.

The Cape Verde Islands were discovered in 1456 by the Venetian, Alvise Cadamosto, on his second African voyage of discovery under the employ of Prince Henry the Navigator, of Portugal. These voyages were part of the extensive maritime discovery of Portugal in the fifteenth century, when Madeira, the Azores and great reaches of Africa were added to the known world. This activity was due to the restless genius of men like Prince Henry and also to the promise of great profits, since in 1441 there was first brought to Portugal gold and Negro slaves from Africa. The Islands were uninhabited when discovered.

In 1461 Prince Fernando, brother of King Alphonso V, of Portugal, sent out colonists to the two islands, St. Jago and Fogo. Those colonists brought to the Islands Negro slaves from the Guinea coast of Africa. During the sixteenth century other islands also were settled by small numbers of whites from Portugal and slaves from Africa. Great difficulty was experienced in getting colonists in Portugal to recruit the earlier adventurers, and up to the middle of the seventeenth century there were few Portuguese in the Archipelago, the scarcity of the water supply being the chief cause. However, there was a gradual spread of population. The liberation of slaves because of religious conviction by the Whites in Fogo resulted in inter-island distribution; there was also a considerable inflow of Whites, undoubtedly mostly Portuguese, from Madeira, who went especially to the Island of Brava. About 1780 there was a Spanish colonization movement to St. Antonio from the Canaries.

It must also be noted that from the sixteenth century up to the close of the nineteenth century a certain number of convicted Whites were deported from Portugal to the Islands. Statistics of numbers are few, but for the seven-year period between 1837 and 1844 we find that 323 men and 23 women were sent to the Islands. This class of recruits, we are told, centered at the port settlements and especially at the capital. Some few became soldiers, but most of them did nothing and were pronounced a "pest" by the other inhabitants.

Elderly Cape Verders now in New Bedford told me that at the time of the Napoleonic Wars a goodly number of Continental Europeans became permanent residents of the Islands. Now and then White recruits have been added from the hundreds of vessels which yearly touch there, while the constant, even though slender, stream of foreign blood fugitively added to a small population of seaport people in time becomes an important factor in the amalgamation process. In the days of whaling vessels, as we shall

"Padre of the Rains"—Seer of Santa Clara

Father Ricard, Who Forecasts Weather Months Ahead by Means of Sun Spots

By ALLAN L. BENSON

MEET the "Padre of the Rains," as Father Ricard is called on the Pacific Coast.

Meet him beside his telescope in the vineyard back of the old Spanish mission at Santa Clara, California.

The best the United States Government can do is to forecast weather 48 hours, or at most a week, in advance.

Father Ricard tells what Pacific Coast weather will be a month in advance. He says he could, if necessary, forecast three years in advance. A San Francisco editor told me that the padre's forecasts are better than the government's.

Late in September, I spent an afternoon with this interesting old man. I found him, at 1 o'clock, taking an observation of the sun. A young student was helping him. Father Ricard, who is 75 years old, was bareheaded and smoking a pipe. His cassock swished around his legs as he walked about. The telescope, which was perhaps 10 feet long, seemed to be mounted right out in the vineyard, with nothing over it, and the brilliant California sun beating down upon it. As the old man smoked his pipe, he watched his young assistant make marks upon a sheet of paper on which the telescope was focused. Each mark indicated a sun spot.

The operation lasted perhaps 10 minutes. Then a little house on wheels was moved over the telescope. We went inside and sat down at opposite sides of a small table. I then had my first opportunity closely to observe Father Ricard. I saw that he did not look his age. He could easily pass for sixty. He has little gray hair. His face is tanned to a brown mixed with red. His eyes twinkle. He laughs, smokes, and talks all at once.

But just then his pipe went out and he had to go to another building to get some tobacco. That gave me an opportunity to look at my surroundings. The little observatory was in the center of a vineyard of two or three acres. Not a blade of grass was growing; only vines. Every foot of the ground seemed to have been freshly cultivated. That is done to retain what little moisture descends during the dry season that lasts from May to November. The vines were hanging full. Some of the grapes were dark and some were white. Away over to one side was a flower garden of wonderful dahlias and gladioli.

Why the Weather Changes

IN A few minutes the padre came back with his tobacco, lit his pipe and settled back in his chair with a smile on his face, ready to talk. I suggested that we begin with a definition of what constitutes weather. Weather, he said, is the state of the atmosphere with regard to motion, temperature, moisture, and precipitation.

Then I asked him why weather changed. This quickly brought us to the heart of his subject. Orthodox scientists attribute changes of weather to the sun and let it go at that. Where they stop, Father Ricard begins. He says weather is determined by the relative positions of the sun, the moon, the earth, and five other planets. When two or more of these planets are in line with the sun they exercise some sort of an electromagnetic influence that starts an electromagnetic storm upon the sun. That is a sun spot. Sun spots upset things on earth and make what we call changes of weather.

Sun spots, according to the padre, travel from east to west across the face of the sun. They have no effect until they reach an imaginary perpendicular line drawn through the center of the sun. Then the spots that passed through the northeastern quarter of the sun produce areas of low barometric pressure in the vicinity of Vancouver and the Aleutian Islands, off the coast of Alaska. All storms start at the point where an area of low barometric pressure centers. When the spots that travel over the southeastern quarter of the sun reach the center they produce areas of high barometric pressure in the vicinity of Arizona. High barometric means a tendency to restore fair weather. The high combats the low. In summer, a "high" means fair, cooler weather. In winter, it means fair, cold weather.

"When I see a spot appear on the rim of the upper eastern quarter of the sun," said Father Ricard, "I know that in not more than approximately six and a half days, an area of low barometric pressure will develop in the vicinity of Vancouver. This is because observation, in thousands of cases, has shown me that a sun spot moves across the face of the sun in approximately thirteen days. But I know the sun spot is coming before it comes because I know that certain positions of the planets produce sun spots. The United States Government works out and publishes the relative positions of the planets three years in advance. From this data I could forecast weather, if I wanted to, three years in advance. It would mean a tremendous amount of work, but I could do it.

"There is the greatest possible difference," he continued, "between the work that the government forecasters do and what I do. The government forecasters do nothing but observe a storm after it appears and guess as closely as possible where it will go and how strong it will be when it gets there. The best guessers guess very well, but still they guess. In other words, they practice an art instead of a science. A man with a quick eye can go far at such forecasting, but he cannot tell what he knows to anybody else. That is because what he knows has come from experience. He can closely estimate the combined effect of barometric pressures, wind velocities and 'counter-storms'—as high barometric pressures are called—but he cannot pass along this ability to another. Each must learn for himself.

"I can do more than that. As I have said, I can forecast the weather for a month and, if necessary, for three years ahead. And I can tell others how to do it. I have young students here who are better than I am."

Forty years ago, weather forecasting was so unreliable that Josh Billings touched it up with a forecast of his own: "Perhaps rain; perhaps not." It is better now, but Father Ricard says the improvement is solely due to increased expertness on the part of forecasters and information from a wider area with regard to weather conditions.

"All storms," said Father Ricard, "move from west to east. If we know what is to the west of us, how rapidly the winds are bringing it to us and what obstacles, if any, are in the way, we know what is coming. Official forecasters used to know nothing about weather conditions except those in the United States and British Columbia. Now the United States Government has

FATHER RICARD.

fourteen stations in Alaska, the most distant of which are considerably west of the American mainland. When these stations were established the daily reports that they telegraphed in were of great assistance to forecasters. They were then able to spot a storm some time before it hit the mainland. They could guess pretty well what time it would strike various localities. It takes, as a rule, seven or eight days for a storm to cross the country and plunge into the Atlantic.

"The invention of wireless telegraphy helped a lot more. The government has now practically commandeered every ship sailing west from Pacific ports. Each ship is required to radio reports of weather conditions on its way across the Pacific. When the distance becomes too great, reports are sent from ship to ship back to the United States.

"Official forecasters are thus able to predict, with more or less accuracy, what the weather will be for a week ahead. But this is only because the area from which reports are obtained has been greatly extended. It is not because observers know any more about forecasting than they did 40 years ago, except as experience has added to the skill with which they practice their art."

I was curious to know how definitely Father Ricard foretold what weather conditions would be on the Pacific Coast—whether he got down to days with definite forecasts or whether he lumped periods and contented himself with generalities. In reply, he showed me his forecast for September for the Pacific Coast, which was a daily detailed prediction of conditions from Oregon to Mexico.

Father Ricard never forecasts for any territory except that which lies west of the Rocky Mountains. He says he cannot. That is because he does not know what track a given storm will take in moving eastward. Nobody else knows. It all depends upon where an area of high barometric pressure springs up, where it goes and how rapidly it moves. Father Ricard suspects that the moon may have something to do with the paths that storms take. He is trying to find out. If he can discover the laws that guide the storms from west to east he feels that he will have done a good life's work. It would then be possible, he says, accurately to forecast weather for the whole United States, months and, if necessary, years ahead. He feels that such information would be of great value to agriculture.

Father Ricard predicted the exceptionally dry weather that has afflicted California since last May. He said there would be no rain of importance until November. Dry weather, according to the padre, moves in ten-year cycles in California. In fact, there are three dry years. The first one is a little dry, the second much drier and the third very dry. This is the third and the worst of the last group of three dry years in California. The state does not look much different than it always does in the early autumn when all vegetation that has not been irrigated is burned to a light brown. But many wells and springs have dried up and all unirrigated crops have suffered. But Father Ricard says that next year will be all right; there will be rain enough.

"I am inclined to believe," he said, "that many weather conditions move in cycles. If we knew the facts, covering a long period, we should probably find that hard winters and open winters, heavy snow and light rains, come according to a fixed order of change. I am sure of this—that the relative positions of the planets determine the weather on earth. If we know the positions of the planets today we may be certain that the next time they assume this position the weather will be exactly what it is today."

I asked Father Ricard how well his forecasts were verified.

"A hundred per cent," he replied. "In the main, what I forecast comes true.

"The forecasters at Washington," Father Ricard continued, "say that my theories with regard to the weather are not scientific and are not true. They say the moon has nothing to do with the weather. But they say what they do not know. They have not a particle of proof. I have proof. When like conditions produce like results—not once, not twice, not twenty times or a hundred times, but thousands of times—we have a right to say that the conditions are directly connected with the results. The first time that I saw sun spots cross the central meridian of the sun I did not say that the areas of low barometric pressure that followed in the vicinity of British Columbia were caused by the spots. I made no such announcement until I had observed the same phenomena thousands of times. If official forecasters wish to dispute the statement that storms follow the passage of sun spots over the upper half of the central meridian of the sun they may do so, but the facts are against them. No scientist, however, who has taken the trouble to understand my theories and the facts that support them, has ever questioned the validity of the theories. There are 'scientists,' of course, who do not want to believe. Such men cannot be convinced."

Wants to Buy a Telescope

WE WALKED out into the sunshine and down the paths through the vineyard. The old padre, still smoking his pipe, began talking about the land of his birth—France—which he left when a young man to come to America. The French, a nation of infidels as he called them, had pursued a violent, vacillating policy toward his church. One government would expel the religious orders and the next would let them back.

He stopped smoking, picked a bunch of grapes and handed them to me. As he began to eat a bunch that he picked for himself his mind shifted to the grape—and its juice.

"I am the professor of ethics in Santa Clara University," he said. "As a student of ethics it is amazing to me to perceive that legislative bodies cannot understand the natural limit of legislative powers. Legislatures can go so far and be obeyed—but no farther. There is an interesting fact about prohibition to which attention is seldom or never drawn. It has always been the heretics who were opposed to the use of alcohol. Christ drank wine. The Turks do not. The natives of India do not. Who is wrong and who is right?"

I thought that if he had reached the mature age of 75 years without becoming a Prohibitionist I would not try to convert him.

Some of those who do not believe in Father Ricard say that as a scientist he is a quack. I am sure that is not so. A quack is a man who, knowing full well that he is a fraud, nevertheless tries to "put something over" on the public. I have no doubt of Father Ricard's sincerity. It is difficult to judge his ability as a forecaster by what he can do in California in the summer when it never rains and the only change, from day to day, is the change from sunshine to fog and back again. I did note, however, that during the evening of September 19 the barometer fell sharply. That, perhaps, was a part of the "triple disturbance" mentioned in Ricard's forecast for the day. On the morning of September 24 I noticed pools of water on the flat roof of a building near the hotel in which I was staying. It may have sprinkled during the night, but the pools seemed to have come from a very heavy fog. At any rate, the padre predicted "cloudiness and sprinkles, even in California" for September 23 and I saw pools of water on the morning of the 24th.

Father Ricard's abilities as a forecaster are generally respected throughout California. Inquiries in many places made this plain. People are interested in his forecasts, as they are published the first of each month, because in the past they have found him right so many times.

As far as Father Ricard is concerned he does not seem to care what anybody thinks. All he wants is $60,000 with which to buy a 26-inch telescope to take pictures of the sun, moon, and other planets that he holds responsible for the weather. If he could discover the laws that make men let go of their money, he would have his telescope. But it is always easier to understand the moon or something far away than it is the man next door.

Mr. Ford's Page

REVIEWS and forecasts are equally futile unless there be a principle to be guided by in making them or a principle to be discovered by making them. A year is but a block of days and weeks and months, marked principally by four seasons, the same now as for ages, ever to remain the same in its basic rhythm; and thus there is nothing to mark this year from last or from next unless it be a change or advance in human progress or principle.

The natural year is, of course, a factor in man's action and his growth. If day were constant and never fell on night; if seed-time, cultivation and harvest did not draw man out by their several compulsions; if seasons did not change, now driving him afield, now driving him to shelter; if time were changeless, endless, man would be deprived of that outer pressure which is his first stimulus to action and the contrivance of means to ends. The natural year has that use, even the changes of the weather, heat and cold, flood and drought, have that use; but these remain; the only gain or loss is in the human result.

It would probably be agreed that one of the greatest gains of the civilized world in the last ten years is a realization of its basic ignorance in so apparently simple a matter as living together. It is not so long ago that the wise men of the world were congratulating themselves that they had at last struck the cosmic gait, that they were building a structure that would resist all change, that they had found the secret of progress. When they awoke the whole business was in ruins about them.

And then they sought to place the blame for the wreck. They placed it here and they placed it there, but nowhere would it stick. Blame has this special characteristic, it must fit or it will not remain. They tried it on Serbia, on Russia, on Germany, on France, on England—finally on the United States. Apparently it did not fit anywhere. And then at last they tried it on the fallacies of civilization, and there it fitted, there it remained. The wrecking principle came from within, not from without.

The lesson was not learned immediately, however; indeed there were long trials at restoration of the old system. "Returning to normalcy" was the fatuous phrase. It was like returning from the crisis to the development of the disease. The period of incubation is always a profitable one for the destructive germ, and it was to this kind of profit that men unwittingly demanded we should return.

LAST year was a great year, measured inwardly. Next year will be a great year in the same sense. We are living in a great time. We are a bridge generation. What we found when we came upon the scene and what we shall leave to those who follow marks the transition from the old to the new. We have been the bridge. Complaints we hear about the seeming slowness of progress are mostly from those who would rather be the crossing throng than the bridge that carries them. But that is not within our choice. Destiny has set us another job. Upon our backs, upon our labors, upon our steadfastness to principle, the world passes from a less good to a better time. And it is not a bad destiny to fulfill. Half our errors, all our frets grow out of short views; take a long view of the function of these years.

It was not the war, but the impossibility of restoring conditions as they were before the war, that gave men the first inkling of the lesson they were to learn. They would have accepted the war as an accident, as a mistake, as a casual aggression, had they not been made to see that the war was but the symptom of a deeper malady, the outworking of a principle that was profounder than anything of political or governmental nature.

They learned this by failure to restore the conditions that caused the war. The old tricks failed. The old wisdom proved foolishness. The old motives were ineffective. The old enthusiasms lacked power. Nothing of the old seemed to remain except the old counsels which had been labeled impractical. They stood. The "impractical" things were seen to be the things that had survived. These old counsels had not failed, for they had not been tried.

If losing a false wisdom and finding a new beginning of learning is progress, then we may say that the world has progressed. Its cocksureness is gone. Its old principles are disproved by experience. It sits amid the wreck of all its falsities. And no time is more full of hope than the time that knows the wreck of falsities. That marks a stage in advance.

Not that all the falsities have fallen as yet. Progress is not so clean cut as to permit of that. Progress is not marked by a definite boundary across which we step, but by an attitude and an atmosphere. Everything false does not fail at a given moment, and everything less false arrive. There are efforts being put forth even now along the old lines; it is necessary that they be put forth; only in this way can the old system be drained. And the fact that they are being put forth by some of the alleged wise men of the earth only shows that even wisdom is not wise when she ignores the plain implications of the times.

On the whole, however, the corner of progress has been turned. A great distrust of the old method of selfishness has been sown broadcast through the world, and a greater trust that somewhere the basic principle exists is regnant. That marks a phase of progress that will be felt in every field, for what transpires in mind soon makes its influence felt in matter.

The note of impatience was heard—would that this change could move more swiftly! And yet how swift it has been! Measure the past twenty years against the last three centuries: have we been moving swiftly? Surface and bowels of the earth; depths of the air; time and motion and power; chemical mysteries; secrets hid from the ages—these are the conquests of the last two decades. Where once it took centuries to disseminate an idea, it is planted now in days. Communication is instantaneous; the world thinks simultaneously. There is now such a thing as universal thought; it broke over all confining limits during the war. The reactions of the world can be determined in a day, and its purpose crystallized in a night.

So the fact is, we *are* moving swiftly, much more so than we realize. And the new era *is* coming to pass much more actually than we see. It is as yet so much confused with the passing debris of the old that sometimes the impression is one of chaos. Nevertheless the new order is pressing up through the confusion to take its place, even to force its place, wherever the old has been sufficiently forced out.

We are living in a great time. We are a bridge generation. Upon our backs, upon our labors, upon our steadfastness to principle, the generations are passing over from a less good to a better time. The complaints that we hear about the slowness of it all are mostly from people who would rather be the crossing throng than the bridge that carries them across. But that is not within our choice. We must do the job that destiny has given us, for if we fail the next generation will not get across to a better footing. We may go forward confidently with everything we know to be right and useful, in the fullest faith that what we thus build those who come after will find most fitted for their use. Take the long view of these things; more than half our errors, almost all our frets, grow from our short views of life.

In the deepest sense, therefore, the year 1924 was a time of progress. The wisdom of the world lost some of its conceit, and gained a humble sense of the existence of Law, which cannot be bent or twisted to any scheme of shortsighted racial, national or individual selfishness. And that determines the outlook for 1925. There is still some dependence placed upon schemes redolent of the old time, but these schemes will fail from the pressure of the new times. We need not become disturbed by them; they involve mostly the exploiter-class though they are veiled as humanitarian attempts to help distressed nations—they will do no harm to the nations, and they will demonstrate that the old exploitation system will have impossible sledding in the new world.

Economically the new year will be a good year. But all years should be that. It is but the natural result of honest life. All the years would have been prosperous had men realized, as they are beginning now to realize, that the Laws of life cannot be broken.

A volume of 452 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

1. Notify us at least two weeks in advance.
2. Give both old and new address.
3. Write clearly.

Getting Down to the Root

THE President's announced intention of calling a conference of Governors to consider the possibility of reducing State and County taxes is an indication that the ax of economy is to be laid to the root of the tree. It also calls attention to the fact that the tax burden of this nation is not all of Federal origin. Not only Washington, but the State House, the County Seat and the City Hall have their share of responsibility of the tax load of the people. If economy can be practiced at Washington, it can be practiced by State, County and Municipal governments as well. A conference which should consider the debt of the country, as composed of these other government obligations as well as of Federal obligations, would not be an interference with State business, but would indicate a community interest which may easily lead to practical co-operation.

The Shelving of Trotzky

LEON TROTZKY has been ordered to "a warmer climate." It would appear that the climate of Russia is getting too cold for some of the "fathers of the revolution," dead and living. Recently it was announced that the mausoleum in which reposes the mummified body of Lenin was to be artificially heated owing to its frigid atmosphere, and now it is Trotzky who is to fly from wintry conditions.

Trotzky has failed to measure up to the standard required by Zinoviev, the head of the Third International, and his colleagues, who are the real rulers of Russia. He has not been Red enough for the Reds nor sanguinary enough for the sansculottes. He has dared to criticize the wisdom of Zinoviev in stupidly trying to engineer Red revolutions in various countries, particularly in those countries where Anglo-Saxon common sense stood firm against alien chaos.

Not that Trotzky loves revolution less, but hates incompetence more. The revolutions Zinoviev advertised in England, the United States and elsewhere never came off. Trotzky had a right to criticize—but not in Russia! He presumed too much on "freedom" there. Perhaps he had been reading some of the dope given to "foreign correspondents."

Whatever may be said of Trotzky, he is not stupid, and Zinoviev is nothing else. Demagogues of the Zinoviev type do not like to be told that they are stupid, and their policy is to get rid of anyone who dares to say so. The significant thing is that stupidity is gaining power over shrewdness in Russia—Zinoviev ruling Trotzky. It certainly proves the British Government to be correct in its contention that the Third International is the principal element of Sovietism, and it should satisfy the world that Bolshevism does not primarily propose to build Russia but to destroy the rest of the world if it can. The principal business of Bolshevism is found in the program of the Third International, not in the policies of the United Socialist Soviet Republic—the U. S. S. R. of sinister fame.

The people of Russia have allowed themselves to become the playthings of a handful of needy adventurers of no determinate nationality, but with common racial characteristics. Perhaps they will have the good sense to see that the one thing that blocks their progress and delays the day of their real regeneration is their toleration of a tyranny such as Czarism at its worst would have deemed impossible.

Let the Journal Refute It

THE *Wall Street Journal* is not successful with humor. And when, quite contrary to its custom, it cites opinions and omits to name their authors, it loses in convincing power. Its recent assertion under a Washington date line—we rather hesitate to credit it to an informed Washington correspondent—that the capitol is "amused" by THE DEARBORN INDEPENDENT'S assembly of facts bearing upon the failure of all attempts by American citizens to open up honest trade with Germany, and the success of similar attempts by German-Jewish financiers, would have been more in keeping with the *Journal's* dignity had it indicated the amused persons. THE DEARBORN INDEPENDENT knows many persons in Washington whose reaction is very far from amusement, equally far from being amusing, but when it is ready to print that fact as news it will not allow it to remain in the doubtful state of anonymity.

The *Journal's* writer apparently knows the outlines of the truth about Paul Warburg's relation to the Federal Reserve and through that to the American financial system, but cannot reconcile the fact that at the secret Jekyl Island conference Senator Aldrich advocated a central bank plan, with the fact that in the present system there are twelve regional banks. This betrays an ignorance of comparatively recent financial history. The story of the Jekyl Island conference was told by B. C. Forbes in *Leslie's* during 1916. And no less an authority than Professor E. R. A. Seligman, of Columbia, tells (Proceedings of the Academy of Political Science, Vol. 4, No. 4, pp. 387-390, July, 1914) that Senator Aldrich "was won over by Mr. Warburg to the adoption of these two fundamental features," first, the central bank, second the European system of rediscount. The *Journal* writer should read this very informative article. He will find that "the concession in the shape of the twelve regional reserve banks . . . . is, in the opinion of Mr. Warburg . . . . a mistake." "The existence of the Federal Reserve Board creates, in everything but in name, a real central bank." All these facts are pertinent to the "amusement" with which the *Journal* writer deals. And he can find still more information in Volume Three of the Studies in the Jewish Question, entitled "Jewish Influences in American Life." In that little book he will learn that Mr. Warburg, upon his examination by a Committee of the Senate as to his fitness to serve on the Federal Reserve Board, proposed to "overcome in an administrative way" this little error of allowing twelve regional reserve banks to exist, which so shadowed his plan for centralized New York control.

THE DEARBORN INDEPENDENT has no interest in Mr. Warburg or any other distinguished persons as individuals, nor even as Jews or Gentiles, but as influences. In that respect it will be found that the statements made in this paper concerning the defeat of American efforts and the success of German-Jewish efforts are worth reading and comparing with the data given and obtainable.

This, of course, is offering advice in the *Wall Street Journal's* own field, and it is difficult to conceive that that highly serviceable financial daily does not know what has been long known to many New York bankers. But the last thing to do with such articles as those commented on is to seek for amusement in them; they are too deeply rooted and too seriously undertaken.

If the *Wall Street Journal* has any refutation to make, there are people in Washington, Dearborn and New York, who would be interested to weigh and test it.

Go Forward!

IT IS not so much the speed with which things are done that counts, but the steadiness. An essential of all kinds of progress is that it be continuous. There must be no standing still. The rate of progress may, for one reason or another, slacken at times, but the movement must always be forward. A man's pace may be comparatively slow, but if he pursues it steadily and with his eyes wide open, he makes more progress than one who rushes along blindly for a time, and, exhausted by his exertions, stumbles frequently and sometimes loses the path altogether. "It's dogged does it." Choose your goal, keep steadily on. Whatever occurs, you will find yourself farther forward than if you had never begun.

Samuel Gompers

IF, AS it is reported, Samuel Gompers' last words were, "God bless American institutions," it was but the expression of a life-long appreciation. Although he was the leader of the American union labor movement, he was not identified with many of the fallacies or excesses which have marked that movement from time to time. He kept to the main lines on which public opinion always agreed, namely, that good working conditions, decent hours, a wage sufficient to maintain the American standard of comfort and self-respect were the least that industry owed the multitudes of workers who staffed its various enterprises. These contentions seem self-evident now, and doubtless they would have been generally acknowledged long before they were, had not bad temper been aroused, as it always is, in a fight. There were rowdies in the A. F. L.; there were rowdies also in the National Employers' Association. The extreme labor press was not more vitriolic than the extreme employers' press. Both sides had each its own quota of plug-uglies, some of them in overalls, some of them in broadcloth and plug hats; these were the destructive elements.

Samuel Gompers was a Jew who did not seem to have inherited certain traits which the influx of Asiatic Jews have given the public to consider as characteristically Jewish. He was English born and was probably a purer type than the half-breed hordes which swarm this country. His ethical strain was strong and enduring. He mingled a strong idealism with a very practical ability. He maintained his leadership, not by strong-arm methods, but by the steadfastness of his character.

The worth of Mr. Gompers to the nation has been fully realized since the war. In the aftermath of Red propaganda, Gompers stood firmly for American institutions. When the Bolsheviks used their "boring from within" tactics on the American trades unions, Gompers checkmated them at every turn. No man knew better than he the components of Soviet-Bolshevik-Internationalism. Toward the end he gave way to bad political counsel. For no one could have known better than he that, except in extreme instances where the general public also joined, there was in this country, and could be, no "labor vote." American workmen are American citizens and vote as such.

But Mr. Gompers' influence did prevent in large degree the American trades union movement being deceived or outwitted by the Russian Jewish faction. It is to be hoped that his successors will be as wise. In Russia, at the Red International of Labor Unions, held last November, one of the streamers across the convention hall read—"THE TRADES UNIONS ARE THE SCHOOLS FOR COMMUNISM." It reads like the statement of a fact, but it is not a fact; it is the expression of the Red Russian Jewish program. Directly it becomes a fact, American trades unionism is dead. Samuel Gompers saw this most clearly, and doubtless he has left disciples who will keep the vision alive.

Is It Too Much Law?

ONE of the causes of lawlessness in this country is that there are too many laws. The more laws there are the more chance there is of people breaking them. But the trouble with most laws seems to be that no sooner are they on the statute book than someone comes along with another law calculated to sap and undermine them and render them innocuous or useless.

A gentleman of the name of Bumble once declared in a moment of irritation that the "law was an ass"—which was rather a sweeping statement, as Bumble included all law in his classification. But if Bumble was right it only goes to show that law only partakes of the assininity of its makers. But even so, as long as a law stands on the statute book it ought to be respected. And if it is not a good law, no shorter way of proving its unfitness can be found than that of enforcing it.

Every state, upon analysis of its statutes, would find many enactments that have become obsolete or have proved impracticable. A judicious redding up of the accumulated legislation of the last hundred years or so might do much to clear the way for a better state of things. What is good and sound and workable may be retained, and all that makes for the public good.

That there is an alarming slackness in the administration of the law in this country cannot be denied. There are too many sources of defeating the ends of justice which are get-at-able by those interested. Pressure is brought to bear in quarters where it should never be tolerated, and many a crime goes unpunished. Better to have a few laws that are effective and properly enforced, than a conglomeration of half-baked legislation that is worse than useless.

Ultima Thule—He Found It a Three Year Exile

First White Man to Penetrate Remote Arctic Wilderness Tells Experience

By GUDRUN TOKSVIG

THE members of the Fifth Thule Expedition, organized by the Danish Government and private initiative, and whose main object was to trace the ethnological and anthropological relation between the Greenland and American Eskimos, have now all returned to Denmark except Knud Rasmussen. The latter still keeps westward from Alaska to investigate the Siberian tribes, but he is soon expected in Copenhagen.

So far the expedition has cost the Danish Government 280,000 kroner and private capital 150,000 kroner. The Danish polar explorer, Peter Freuchen, the expedition's zoölogist and botanist, who counts this his sixteenth Arctic exploration, returned to Copenhagen recently on the Royal Danish Greenland Trading Company's ship, the *Hans Egede.*. Accompanying him was the mechanical engineer, Blichert Hansen, whose problem had been to transport the six-ton meteor found by Knud Rasmussen in 1913 in North Greenland, from its mountain resting place down to the sea. It will remain on the beach until next year when it will be shipped to Denmark. Two days later another member of the Thule Expedition, the author and anthropologist, Helge Bangsted, returned on the *Frederick VIII* via Winnipeg.

Freuchen left Denmark three and a half years ago, in 1921. With him went the first motion-picture expedition to Greenland as well as the National Museum's Research Expedition, who conducted a series of excavations in South Greenland, the latter finding interesting medieval-cut costumes and tools belonging to the ancient Norsemen. Two weeks later, Knud Rasmussen sailed with his ship, the *Sea King* (Sökongen). Freuchen is the third expedition member to return. The first two men to return were the anthropologists, Birket Smith and Therkel Matthiasen, who arrived at Copenhagen in the spring of 1923.

After the completion of the films, Freuchen started north from Lyon Inlet to solve his problem proper, namely, to survey and chart the archipelago between Greenland and America, and to conduct botanical and zoölogical researches. Freuchen is the first white man entirely to penetrate Baffin Land. Some regions here had not been surveyed in the last 200 years.

The most important surveys in Freuchen's eyes are the maps he made of Southampton Island, east and north coast of Melville Bay, Milne Inlet, south shore of Lancaster Sound, entire Admiralty Inlet with adjacent fjords, and north coast of Fury and Hecla Straits. Baffin Land is now really surveyed. Some islands hitherto believed to exist do not exist. A couple of fjords continue farther inland than hitherto believed, and he has named new fjords and bays.

"The animal life in Baffin Land is rich and varied, and would be a gold mine for the natives," says Freuchen, "if the Eskimos were as clever hunters and kayak-men as the Greenlanders." Their kayaks and tools were such as had been used in olden times in Greenland, and on the whole he found the people in a more primitive state than the Greenland Eskimos. Freuchen's two Greenlandic Cape York Eskimos, who accompanied him, caught fully as many animals as a whole colony of forty Canadian Eskimos.

Reindeer abound here in great herds every summer, and wolves, fox, ermine, marmot, and so forth, are plentiful. Along the coasts are many whales and seals, while the streams are rich in salmon and other fish. A considerable variety of flowers and grasses is found, as well as butterflies, bees, and other insects; but birds are rare because the ermine eats the young ones.

Naturally, Freuchen's trip did not proceed without considerable hardships. Frequently dogs, flowers, and hare excrements were the only available food. Freuchen, himself, during a snowstorm developed gangrene in one foot which necessitated amputation of his big toe at Lyon Inlet.

During the advance north, some equipment had been left behind which Freuchen went back to get when he was overpowered by a violent snowstorm. Using his sled as a windshield, he bore up as well as he could, but when the storm was over he was deeply buried under several feet of closely packed, frozen snow. He could scarcely move, but after eleven hours' work he finally succeeded in extricating himself. Meanwhile his comrades had camped only a few yards away but had not heard him.

Freuchen found the Eskimos in the north of Canada friendly and honest as all Eskimos are, in his opinion, when one gets to know them and treats them fairly. These people are of pure Eskimo extraction; purer than the Greenland Eskimos. Curiously enough, they had never seen a white man, yet all could write. They employ hieroglyphics, their language being composed of thirty-two syllables, each having its written symbol.

Generally speaking, these American Eskimos do not lie nor steal, but they kill each other at the drop of a hat. The Fifth Commandment is unknown. Curiously enough a murderer goes free, but revenge takes the form of the literal interpretation of the words: "If you kill *my* brother, I'll kill *your* brother."

"Unlike the Greenland Eskimos," Freuchen says, "the Eskimos in the north of Canada are, as a rule, not Christians. And the ones who first become Christians are generally not the best nor ablest among them. They believe in the Great Spirit who has as his prophet the Angokok who has the power to invoke the Great Spirit. The Angokok, again, has a staff of assistant spirits.

"Every man has his formula which he uses in danger and he must not reveal it, or it loses its power. Man consists of three things: a body, a soul, and a name. When a man dies, his name wanders out into space to fasten itself to a soul. The tiny child weeps because it has no name. The spirits whisper names around the house, the oldest of the tribe listens, and gives the child name according to what he thinks he hears.

"When I returned next year to the same tribe, I found there had been a missionary with them from Igliluk—a man of forceful personality. In a short time he had done away with almost all the impracticable old taboos, so that life had become easier, and the inhabitants Christian by name. They carved crosses from walrus teeth but their Christian belief had its unique features. The faithful could, for example, still freely continue to exchange wives, but only with Christians. They could also still buy wives or sell daughters but only in the narrow circle of the true believers.

"Christianity, however, brought with it a certain humanitarian point of view, although, hygienically speaking, of a somewhat unfortunate nature. Hitherto, three old members of the tribe had been isolated because they were afflicted with a loathsome disease, otherwise not occurring in these parts. These three were now readmitted into the tribe; and I saw an old woman with big, running sores in her head, minding children.

Photo shows Peter Freuchen with his little daughter who had not seen him since he went away in 1920.

"Suicides are not uncommon. The favorite method is by hanging. I remember a case of a man who wanted to hang himself. His fellow Eskimos set great store by him, and accordingly offered him a pound of tobacco if he would live on. He promised, but tired quickly of smoking the tobacco, and one fine day he hanged himself after all.

"Girls are, as a rule, killed at birth, unless they are almost immediately sold or promised in marriage. Hence, there is a scarcity of women, and most of them have two husbands. Famines sometimes induce cannibalism. I saw a woman who had eaten her husband and her five children during a famine. Now, she is a great lady once more, married again and respected.

"Death can also be heroic. An old woman saw that she was becoming a burden to her son. 'Build me a snowhouse,' she said, 'and abandon me.' But the son would not. He was fond of the old woman and would have her with him. But she kept insisting, and he finally gave in and built the house, and walled up all openings, so she could not get out. A tiny hole was left at the top through which the name and soul could escape—the immortal parts of the human being. A few days later we found the old mother dead in the snow hut."

"In the spring of 1923" says Freuchen in another interview, "I was staying on Vansittard Island near Lyon Inlet, together with my Cape York Eskimos and Helge Bangsted. After accomplishing some map surveys, I went in June to one of the Hudson's Bay Company's stations in Repulse Bay, and with whaleboat down to Rowes Welcome, a sound along Southampton Island. It was an arduous journey, made difficult by heavy pack ice. Here the Hudson's Bay Company has a big station with a police force of sixty-five men. Murders are not infrequent. The police undoubtedly have the best intentions, but unfortunately know nothing of the Eskimo language, and grave misunderstandings consequently arise.

"I was a semi-invalid because of the frozen foot I had got on my winter expedition to North Baffin Land. Nevertheless, I pottered around a little and killed time by excavating the ruins of some old Eskimo houses. Finally one of the Royal Greenland Trading Company's ships came up with a doctor, who operated on my foot. I stayed here until the beginning of August, when I returned to Repulse Bay on a little schooner, and came back to Vansittard Island in October, where Bangsted had stayed all summer with the Cape York Eskimos, and had had very good hunting.

"We left here the day after Christmas going north along the eastern coast of Melville Peninsula, a region only loosely charted by Peary, but which I now surveyed in more detail. February 5, we came to an *Iglulik* colony by Fury and Hecla Straits where we stayed about eight days and caught several walruses. From there we drove up through Baffin Island, and here determined that the fjord of Milne Island extends much farther inland than hitherto believed.

"At Ponds Inlet where the Hudson's Bay Company has a station, we rested a little while, and the dogs were given extra fodder. We then kept on along the southerly side of Lancaster Sound to a point called Cape York, and attempted to force Lancaster Sound by means of our sleds, to which we had tied our hunting buoys. Out in the middle of the Sound, however, a wind blew up, the ice packed, and we had to seek back toward the shore, a very difficult matter because the ice carried us out almost as fast as we could drive toward the shore.

"This maneuver made us lose our tents, and we now had a rather difficult time because the snow was still too soft to allow building of snow huts. We had to return south around Admiralty Inlet where I discovered a large fjord, which I named Fabricius Fjord after the Danish zoölogist. Here we met with an Eskimo tribe afflicted by a species of boils. Unfortunately our own Cape York Greenlanders became infected, so that we had to let them remain here for the time being. Happily, I induced a young Eskimo of the tribe—Malla—to accompany us as guide against pay and fair words. The pay was a gun and a wife, who brought a sled as dowry. A very nice wife, by the way!

"We kept on straight ahead through the country, Cockburn Land. The region is the northerly part of Baffin Land, a very hilly stretch, while the southern part is level clay. Again, a most strenuous trip. We had barely enough fodder for the dogs, and we had to eat one of them, but now and then we shot a reindeer; otherwise we lived on hare excrements. On June 27, 1924, we returned to Ponds Inlet, whence we came to Bilot Island where there was good whaling. The Thule Expedition ship, the *Sea King,* arrived here July 31, went down to Admiralty Island and took on board the Cape York Eskimos we had left there. The *Sea King* had been in Thule to see if we should have arrived there, but now fetched us here after previous agreement. The ship had too little oil to return to Thule, and accordingly sailed over to Cape Seddon in Greenland by Melville Bay, and put the Cape Yorkers on land here. From there I came down to Upernivik where I boarded the *Hans Egede.*"

Helge Bangsted, the Danish anthropologist, the fourth member of the Thule Expedition to return, was gone four years, and had some stirring adventures of his own. September 26, 1923, Bangsted left the expedition headquarters on Danske Island near Lyon Inlet, and went south to examine the comparatively unknown Eskimo tribes, who, practically speaking, had had no contact with white men. They lived about 200 miles south of Danske Island in the region around the big Baker Lake and the Kazan River. Bangsted was here to continue his ethnographical researches as well as around Ranken Bay.

Besides Bangsted, there was only the Eskimo Siutluk, meaning, "He with the Ear." The heavy frost was late in 1923, and the result was that they traveled on thin ice nearly the whole trip. A couple of days after breaking up camp to reach Chesterfield, the ocean ice broke under their sleds. They lost all provisions, films, camera, and so forth, as well as several dogs without it being at all possible to attempt to save the animals, and much clothing had to be discarded because they could not get it dried. A proposal was made to turn back to get new equipment, but they finally decided to go on.

They managed to sustain life by hunting. Fortunately there was plenty of reindeer in these regions, and not a few seals, so they kept on to Chesterfield where Hudson's Bay Company has a station. Here, around Baker Lake, however, this branch of the expedition met with new difficulties. The Eskimos had starved all winter. Situated far inland, the Eskimos have only the reindeer to fall back upon. If the reindeer migrations are a failure, starvation is the result. This had just happened when Bangsted came. Neither had these Eskimos any clothes because these are mostly made of reindeer skin. They had been sustaining life by the help of one or two small salmon a day for a family of five.

Bangsted found the Eskimos in this region more primitive than the Greenlanders, but the race is the same.

John W. Goff, Who Made Manhattan Clean

Noted Lawyer Who Tackled Tammany and Gave Graft a Black Eye

By PETER SCHUYLER

ON THE tenth day of November, 1924, there passed out of the life of Manhattan one of the most picturesque, colorful, and compelling figures that ever occupied the center of the stage in "The Largest Hick Village in the World."

But because John W. Goff had done so much to make it tolerable in the nostrils of the nation, Manhattan let him go to his grave with as scant ceremony as if he had never done anything for the good of the community. A grafting district leader would have caused more comment by his death.

Thirty years ago Goff's name blazed across the front page of every New York paper with daily regularity. He was then the special counsel to the Lexow committee which was investigating vice conditions in the city. Day after day he dragged from its apparent security some fresh form of graft and with it the names of the grafters who battened off it. He cleaned Manhattan's house as it had never been cleaned before. The rule of Tweed had been destroyed with the pencil of Tom Nast, the cartoonist, as a powerful weapon in that attack. But Croker succeeded Tweed, and Croker's Tammany was the same jungle tiger as Tweed's. One boss was dethroned but another took his place. The system itself was continuing and indestructible—apparently. Then came Goff, with his mild blue eyes, his soft Irish brogue and his unfailing courage. When Goff finished Croker was not only driven into oblivion but the system he represented was smashed forever. For the first and only time in the history of the city professional politicians learned the bitter lesson that there was really no such thing for them as immunity from the law. And John W. Goff was the schoolmaster who beat the lesson into them. Tammany never forgot nor forgave him for what he had done to it although with paradoxical frankness it admits that "the organization" is better off now without the old "dirty" graft than it ever was with it. But it refused to credit Goff with being the cause of the reformation. According to Tammany he had nothing to do with it. The reform came from a virtuous interior impulse, not his outside pressure. In any event it did not take Goff to its bosom after he had beaten it, as has ever been the accepted Tammany procedure. It realized that he could never be used. Manhattan at large realized that fact, too. He lived a free agent in all that phrase implies and he died a free agent. He never would play "the game" and Manhattan has no niche in her hall of fame for anyone who refuses to be "regular."

An Everlasting Nightmare

SMALL wonder then that when Goff, the stormiest of all its stormy petrels of bench, bar, and public life, took his last long flight that the city, for whose fair name he had waged war so relentlessly against the forces of corruption, scarcely noticed the event. For years he was the tireless pursuing fury of systematized vice. At every political feast he was the Banquo's ghost. He was the everlasting nightmare that haunted the slumbers of the higher-ups. Criminals called him "a hanging judge." Politicians labeled him "fanatic." Lawyers who never could reach him when he was on the bench and corruptionists who could never do business with him when he was off it branded him as "radical." Higher courts set aside his decisions and reversed his judgments. It made no difference to Goff. He was absolutely uncontrollable when justice was involved and his efforts to see it done were unhalted by any personal considerations.

It was not easy to connect the physical man with his record. It took some imagination to visualize in the tottering, spare old man with the red-apple cheeks, the shock of snow-white hair and venerable beard, the incredibly soft and melodious Irish brogue and the mild blue eyes, the crusader of Lexow days, the unshakable independent who was New York's last Recorder, the imperturbable Supreme Court judge who sent to the electric chair the criminals in the Rosenthal murder, and one of the moving spirits in the *Catalpa* romance.

Goff's age was for years a subject of bitter controversy. Whenever there was a possibility of his presiding at a trial where graft was involved, the date of his birth was discussed. Those interested in getting an unfixable judge off the bench clamored that he was as old as Methuselah and should have been retired years before. "How old is Goff?" was a question as popular and unanswerable as "How old is Ann?"

But if his enemies thought they could force the old man into retirement before he wanted to go they were mistaken. Goff paid no heed to the discussion. The schoolhouse wherein were kept the birth records of the village where he was born had been destroyed by fire. There was no way of checking up on his years, and the subject of the controversy kept an immutable and irritating silence. The last time his age became a matter of importance was during the trial of the Rosenthal murderers. In the person of Lieutenant Charles Becker, police graft had staged its comeback in Manhattan affairs for the first time since the Lexow investigation. Becker was an old-style Croker-Tammany cop, and when he was indicted for complicity in the killing of Rosenthal "the system" was once more dragged to the dock. By one of the ironies of fate, the judge assigned to try the case was Goff, the same man who as prosecutor had given police-politician graft its quietus in 1893. Under the circumstances the enthusiasm of the defendants was not altogether hilarious. They knew and the power behind them knew that no one living could "get to" Goff. So the point was raised that by reason of his age Goff was precluded from hearing the case. Without the slightest sign of irritation Goff ruled that he was competent to preside at the trial and the Court of Appeals to which the matter was later taken decided that he was.

He made no secret of the fact that he was born in Ireland, came to America friendless, and went to work in the dry goods store of another Irishman, A. T. Stewart. Out of that job he pulled himself by the boot straps. During his lunch hour he used to wander about the courts listening to what was going on. If, as has been stated, he then reached the determination to study law, he also got a hatred for judicial injustice and a contempt for legal red tape when there was a straight-out issue of plain right and wrong, which was one of his outstanding characteristics later. He worked in Stewart's shipping room during the day, studied law at night, and in 1870 was admitted to the bar. Six years later he sprang into prominence by reason of his connection with the *"Catalpa"* affair.

The "Catalpa" Affair

IN 1866, John Boyle O'Reilly, the Irish poet, was, with twenty companions, sentenced to penal servitude in Australia for stirring up rebellion among the English troops stationed in Ireland. O'Reilly escaped from the settlement in Van Diemen's Land and as soon as he was at liberty started a plan to rescue his companion. Goff, then struggling along as an unknown lawyer, but a fiery worker in the Irish cause, was made chairman of the secret executive committee which hired the *Catalpa*, a whaler out of New Bedford, and sent her on the voyage to Van Diemen's Land. There she picked up O'Reilly's companions as they fled the penal settlement and stood out to sea. An English frigate fired a shot across her bows as a hint to stop but the skipper of the *Catalpa*, Captain Anthony, a rock-ribbed New Englander, promptly hoisted the American flag and profanely invited the English frigate to fire on that. Discretion, disinclination to kick up an international row, or the more probable feeling of "Goodby and good riddance" kept the English captain from accepting the invitation and the *Catalpa* made off with her human salvage.

Whether his prominence in the *"Catalpa"* affair started him on his upward career cannot be asserted with assurance but it probably had something to do with it. For all his devotion to the cause of Irish freedom Goff never trained with the Tammany Irish of Croker's type. No one can be as bitter toward his racial brothers as the idealist Irishman is against the materialist kind. The Tammany Irish always distinguished between "clean" graft and "dirty" graft. The former came from protection given to saloons violating the excise laws, or from contracts to do city work; the latter always came from prostitution and for that reason was held to be reprehensible. Goff, the idealist Irishman, hated graft of all kinds and grafters of all descriptions. That was the reason for his selection as counsel for the Lexow committee.

In 1893 Manhattan was rotten to the core. It was a Presbyterian clergyman, the Rev. Dr. Charles Parkhurst, who took on the nauseating job of showing up things as they were. Accompanied by two members of his congregation, Dr. Parkhurst made a personal investigation of the worst districts and shouted what he discovered from the housetops. The dive keepers and the crooked police tried to build the usual back fire by also shouting from the housetops their belief that it was personal diversion and not moral zeal which prompted the Parkhurst search for evidence. In spite of the mud slingers the clergyman stuck to his job and his disclosures increased in color, detail, and sensationalism.

It happened that the political power in control of the state at the moment was one altogether opposed to Democratic Tammany and it saw in the Parkhurst revelations a chance to destroy a rival and acquire some moral prestige for itself. At the instigation of a lawmaker named Lexow, a committee was appointed to investigate conditions in New York. Tammany gave a hoot of derision. The thing would blow over in no time. It would be a nine-days' wonder. Nothing would come of it. Tammany was cynically sure that no one could uncover its secret sins. It awaited confidently the issue. At the express request of Dr. Parkhurst, John W. Goff, then assistant district attorney, was appointed special counsel to the commission, and the committee moved down to New York for what everyone felt sure was a useless trip. Only the people who knew Goff's uncanny skill as a cross-examiner sat back and waited.

The first few days of the investigation saw Tammany triumphant. The apparently diffident, palpably Irish special counsel with the sweet touch of brogue and the quaintly old-fashioned, almost scriptural English, was getting nowhere. Then under the hypnotic insistence of the mild voice that had never raised a tone a witness broke badly. Without the slightest sign of satisfaction Goff continued his patient, fatherly cross-examination. There was none of the blood-hungry prosecutor in his attitude just then. He was more like a confessor listening to the sins of a penitent. And involuntarily the penitent told what he knew. Then the prosecutor sprang into action. Witness after witness succumbed to his pitiless determination to get at the truth. If it did not come willingly he dragged it out bit by bit. And he never ceased until he got it all. Up into the light he forced the unspeakable story of politics living off every conceivable form of human degradation. Out of the darkness of respectability with which they had shrouded themselves he yanked the scared persons of the men higher up. From Croker, the boss, he wrung the admissions which led later to his retirement from the kingship of Tammany. The police grafters' heads went into the basket one after the other until he had cleansed the force from top to bottom. When the investigation ended Goff had smashed beyond reorganization the hitherto invincible army of graft. He put the fear of God—and Goff—into Tammany and he set in motion the movement which afterward resulted in the complete divorce of the Wigwam and "dirty" graft. His reward was the election to the office of Recorder which he held for twelve years. He was the last of the Recorders and for one reform he instituted the most worthy to be remembered. Here again he killed a long established form of corruption.

Checkmating the Politicians

THE Recorder was really a judge of the Criminal Court before whom were tried all major and minor offenses. The pickpocket and the murderer faced the Recorder.

The first reform Goff put into force as soon as he took office was the disposition of indictments. Prior to his incumbency indictments which were returned by the grand jury were sent to the district attorney's office where that official could either bury them, quash them, or make any disposition he cared to of them. Goff fixed it so that criminal indictments were deposited with the clerk of the court and became part of the record. In doing so he annihilated one of the greatest sources of power the politicians had. They could always bring pressure on the district attorney to quash indictments returned against any of their supporters or keep them on file to make their enemies behave. Goff as a former assistant district attorney knew what was happening daily and with one blow he stopped it forever.

On January 1, 1919, he retired because he had reached the age of seventy. It was the first time he gave his enemies the satisfaction of knowing how old he was and it was quite like him to delay the information until it would do them no good. The illness from which he died was contracted at the polls while voting at the latest election. Those who followed his lifelong unqualified and remorseless fight against "The System" are quite sure he did not cast any "regular" ballot as his final shot. He couldn't do it and be Goff.

Ultima Thule—He Found It a Three Year Exile

Concluded from page 9

Polygamy is prevalent. A man takes a wife to get as many children as possible to support him in his old age. These people were, however, not the most primitive Eskimo tribe that Bangsted encountered. Nearer the pole, the tribes are still more primitive. The so-called *Netjiliks,* whom the author had a chance to study for a short time when he was with Knud Rasmussen on the latter's trip through the Northwest Passage, use bow and arrow. Wood is unknown. The sledge runners are therefore made of the skin of the musk ox, and frozen salmon are used as crossribs in the sleds. These people live almost exclusively on raw meat because they cannot secure any more fuel than is barely necessary to warm their huts or melt ice for drinking purposes. Their clothing consists entirely of reindeer skin.

Bangsted, who studied Eskimo one year in Greenland, made himself readily understandable in that language—practically the same from East Greenland to Alaska—and found the people very friendly and hospitable.

His worst experience during the trip was one summer when he with Birket Smith walked from Yathkeyed Lake to Bear Lake, a stretch of 200 to 300 miles. Hunting was poor so there was nothing to do but store their collections and paraphernalia, and march through the icy wastes to seek stations where they could get food. Three Eskimos accompanied them. In five days they had only one grouse to divide among them—five husky men.

Finally, Blichert Hansen's feat in getting Knud Rasmussen's six-ton meteor down from its original resting place on the *fjeld* to the sea was no mean engineering job considering the primitive equipment at his disposal. It took nearly three years because of difficulties due to the loss of equipment, bad weather, and illness. The first year was wasted, but on February 15, 1923, the real work began. The actual task of getting the stone down from the mountain took nine days with the aid of six Eskimos and sixty-five dogs.

Both men and animals were now too exhausted from lack of food to proceed farther with the stone. In the latter part of April they began again with 14 sledges and 140 dogs. Snow and thin ice hindered progress, but on April 27, the stone was on *terra firma* at Savik, whence it will be taken to the Buschmann Islands next summer by the Cape York Eskimos, and thence on to Copenhagen where the meteor will be placed in the open courtyard of the Mineralogical Museum. The meteor is mostly pure iron and measures 1.55 meters at its broadest place.

Daugaard Jensen, director for the Greenland colonies, who has been on an inspection tour of the country, also returned on the *Hans Egede*. He was well satisfied with the year's fishing results which he found more than the average in most places, especially at Godthaab.

The new radio stations are progressing nicely. Engineer Bretting expects the work to be finished next year. At the Julianehaab colony the mast is erected and the station built. At Godhavn the foundation of the station building has been started, while at Godthaab the work is about finished.

Upernivik is now the only colony in Greenland where there still are eider ducks. The yield of down has hitherto been about two or three hundred pounds a year, but if the birds are not soon protected, they will become extinct. Bistrup hopes to get the same protection for these birds as obtains on the Faroe Islands.

Drainage Destroys Home of Our Game Birds

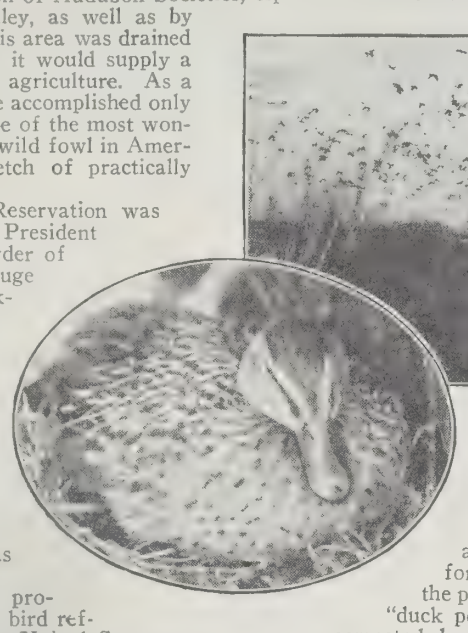
Curious Effects Upon Wild Life of Certain Modern Improvements

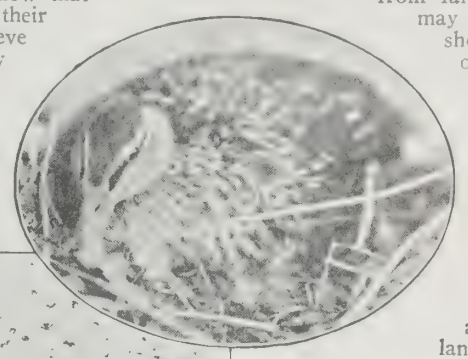
By JAMES CLYDE GILBERT

FULLY fifty million acres of lake, swamp and marshland have been drained in this country during the last few years, mostly for agricultural purposes. Much of this drained land is worthless or at least not worth the effort and money it cost to drain it. When the water is taken from these lands some of the very best nesting and feeding grounds of our migratory game goes with it. This drainage craze is growing stronger and is affecting lands not suitable in any way for agriculture. As evidence of this there is the instance of the drainage project near Muscatine, Iowa, where the level of the river during flood stage makes the soil too wet to cultivate.

The Commissioner of Reclamation in the Interior Department has recently informed the Chief of the Biological Survey that as soon as water is available it will be turned into the Lower Klamath Lake, in California and Oregon, for the purpose of restoring conditions favorable to a multitude of migratory wild fowl such as occupied the lake before it was drained. The restoration of this lake has been actively championed by the National Association of Audubon Societies, especially through W. L. Finley, as well as by the Biological Survey. This area was drained in 1917 with the idea that it would supply a large acreage valuable for agriculture. As a matter of fact the drainage accomplished only the utter destruction of one of the most wonderful breeding places for wild fowl in America and laid bare a stretch of practically worthless alkaline land.

Klamath Lake Bird Reservation was originally set aside by President Roosevelt, by executive order of August 8, 1908, as a refuge for the birds using the extensive marsh areas then existing as breeding grounds. These included large numbers of Canada geese, together with important colonies of gulls, Caspian terns, grebes, and white pelicans. These birds enjoyed the sanctuary thus afforded up to the time the area was drained in 1917.





Thousands of wild fowl will again be available if Federal protection is afforded them in places set aside for their breeding.

Commenting on the prospective restoration of this bird refuge, Doctor Nelson, of the United States Department of Agriculture, said that cutting off the supply of water from Lower Klamath Lake had been a striking example of the folly of unwise drainage whereby water areas useful for the support of vast numbers of wild fowl are destroyed for the purpose of developing agricultural lands without first determining that the lands beneath the waters are of any real value, especially as compared with the public asset represented by the wild life which these areas in their pristine condition so bountifully support.

Dr. Nelson also says that it is hoped the rainfall will be sufficient during the coming winter to supply the necessary surplus water, so that the wild fowl may again concentrate there. He added that conservationists and lovers of wild life throughout the country would rejoice over the information that these waters may again resound with the calls of the wild birds.

But that section is but a small part of our bird-breeding country. Elsewhere our migratory game is today facing the greatest, most fundamental danger which has ever threatened it. Birds cannot live in the air!

Overshooting and evils of that sort can be corrected by restrictive laws, but once remove the feeding and nesting grounds and the migratory game is gone beyond recall. Restrictive laws won't help. The Game Refuge-Public Shooting Ground Bill furnishes the solution by providing government-owned permanent refuges for this class of game and for birds valuable to agriculture. On certain areas no shooting *will ever be permitted.*

Today the man of ordinary means is finding it increasingly difficult to discover a place in which he may hunt without being faced by a "no-trespassing" sign. This bill provides the solution by establishing at strategic points each year additional public shooting grounds where anyone may hunt. In time these will be easily accessible to the hunters of every state. The bill also provides funds with which to combat the duck disease which annually kills millions of ducks in the West. The effect of the bill is also very far-reaching in other ways. By means of it the government will recognize two most important points: the necessity for perpetuating the American system of free shooting; the effectiveness of the game refuge system. Once the government has established these refuges and the beneficial results are clearly seen, the various states must see the advisability of adopting the idea—establishing their own public shooting grounds and refuges for local game. All these things can be accomplished without the cost of a single cent to the general taxpayer.

Literally thousands of sportsmen, men who enjoy bird hunting, have come forward and offered to supply the funds to the government because they know that only through the provisions of this bill will their sport be preserved and because they believe that since they get the chief benefit they should stand the expense.

Wealthy individuals and gunning clubs have extended their holdings to such an extent that the shooting open to the public is being rapidly cut down. Then, too, we have today but twenty-five Federal wardens to enforce the provisions of the Migratory Bird Treaty Act in the entire United States and Alaska. We have thousands of acres suitable for the propagation of waterfowl except for the fact that there is insufficient feed of the proper varieties such as wild celery, wild rice, "duck potatoes," and the like. This can easily be corrected by introducing suitable food for the birds.

It is a well-known fact that wild ducks must have water if they are to survive. With the rapid increase of hunters in the country the situation is revolving to the point where they must at least make the attempt to save the shooting or face the possibility of no shooting. During the autumn migrations there is barely a damp spot in the United States that does not have at least one gunner lying in ambush for the unsuspecting migrant. If we are to provide shooting for posterity there must be resting and feeding places at various points between Canada and the Gulf of Mexico.

Under the provisions of the bill every man who hunts migratory game birds must take out a Federal hunting license costing $1, which is less than he pays for one box of ammunition. This money goes into a special fund. Approximately one-half of it will be used for the purchase of refuges and public shooting grounds; the other half will be used for the care and protection of the birds, both game and otherwise.

The question has been raised that to talk game refuge and a public shooting ground is inconsistent. Such a viewpoint comes only from the man who is not thoroughly conversant with the habits of our migratory game birds. Some of the refuges purchased under this bill would act as a sanctuary twelve months a year, in which a shot will not be fired except in the control of predacious birds and animals. On others, it is perfectly legitimate or proper to permit shooting during certain seasons of the year, under certain restrictions, without in any way hurting the birds. And this would be free to all who could afford the $1 Federal license.

For example, a great breeding marsh in Nebraska, or the Dakotas, may produce hundreds of thousands of birds and be a sanctuary until such time as these birds have departed on their southern journey. Then there is no good reason why this entire tract should not be made a public shooting ground for the balance of the season when the birds are drifting in from farther North. Other tracts may be part sanctuary and part shooting ground, all shooting, of course, being done under suitable regulations and only during the proper season. All this the proposed bill will provide.

The Izaak Walton League has reported that the old bed of Horicon Lake, once nationally famous as a hunting place, but drained a number of years ago in a land-selling scheme, is again under water and that wild ducks and geese by the thousands are flocking there as though the bed had never been dry. During the heavy rains of August the Rock River, which runs through Horicon marsh, was unable to accommodate the heavy volume of water. The excess water flowed into the old drained lake bottom and still covers it to a depth of from four to six feet.

Old-timers say that the amount of wild fowl compares favorably with the number that came in the early nineties, in the days before the drainage promoters substituted the sloughs, bayous, ponds and lakes with sun-baked land consisting mostly of dry peat and on which grew Canada thistles and weeds. If the game refuge bill were now a law a small dam at Horicon city would stop up the drainage and preserve the lake bed for the wild fowl.

As this district is but a short distance from Milwaukee its incorporation into a game refuge would prove an attraction to tourists and to hunters if shooting were permitted at times.

Section four provides "That no deed or instrument of conveyance shall be accepted or approved by the Secretary of Agriculture under this Act until the legislature of the State in which the area lies shall have consented to the acquisition thereof by the United States for the purposes of this Act."

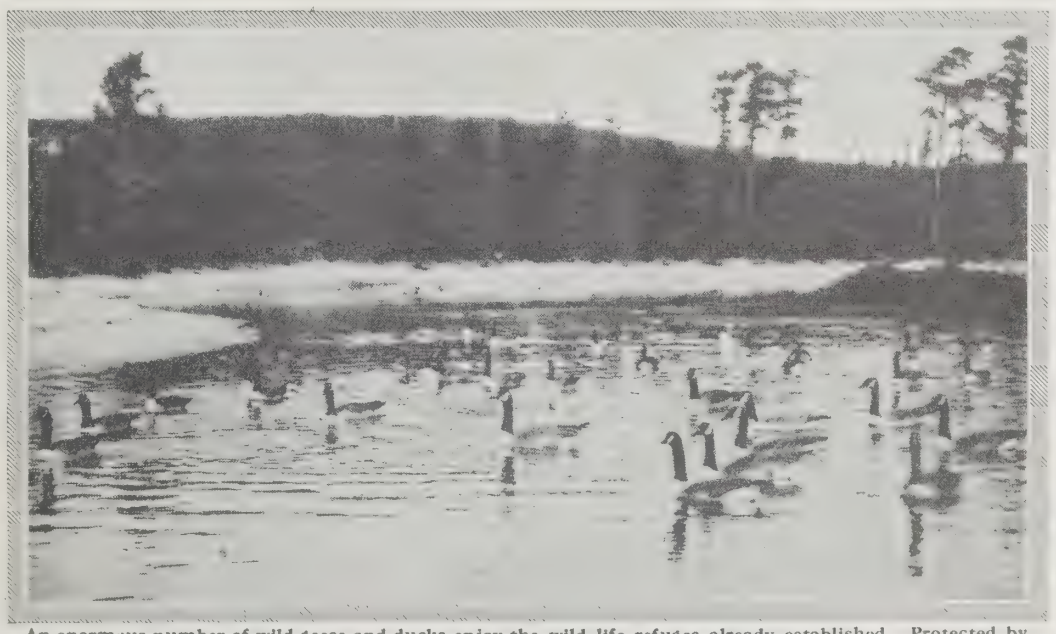
Section five contains the following: "And it shall be expressed in the deed or other conveyance that the use, occupation, and operation of such rights-of-way, easements, and reservations shall be subordinate to and subject to such rules and regulations; and all areas acquired under this Act shall be subject to the laws of the State in which they are located, if such laws are not inconsistent with the Migratory Bird Treaty Act, this Act, or regulations adopted pursuant to such acts."

The fisherman and trapper are protected in Section Six as follows: "Nothing in this Act shall be construed to prevent a person from entering upon any such area for the purpose of fishing or of trapping fur-bearing animals in accordance with the law of the State in which such area so entered is located."

A nominal penalty of $5 for first offenders is the punishment to be meted out to those who might hunt migratory birds without having first secured a Federal license. This amendment removes the objection raised by some against the former measure that the penalties for minor offenses were excessive.

This is without doubt the finest piece of conservation legislation ever introduced in state or nation.

Public interest in the welfare of the wild birds must be aroused. A comparatively restricted area in the South for the birds in winter is gradually becoming more restricted due to the drainage projects, some of which are impractical. Some progress has been made in providing sanctuaries during the months when the birds visit the more densely populated districts of our country, both North and South, but if we are to maintain the wild fowl in numbers that will permit shooting we must provide more protected areas within the next year or two or suffer for our negligence. Ernest Thompson Seton, the well-known wild life writer, advocates breeding places along the Canadian-United States border. He especially urges such places in the cities. He believes that ten acres in town is of more benefit than ten thousand acres ten miles from town.



An enormous number of wild geese and ducks enjoy the wild life refuges already established. Protected by wardens the birds become tame as the fowls of our farms.

New Year's—World's Oldest Holiday

Festival Which Each Country Holds in Characteristic Fashion; Gift-Giving a Feature From the Earliest Dawn of Civilization

By EARLE W. GAGE

NEW YEAR'S DAY is one of the oldest of holiday festivals. The Romans on this day were accustomed to exchange greetings and make presents. Never has it occurred on the first of January. It is probably the most movable feast known to history, having been held in nearly every season of the year; it is also the holiday redeemed, having been saved from the lewd orgies which characterized its early observance, but having been universally established as January 1 since 1752 by civilized peoples.

A wise prophet of long ago, who had given considerable thought to the flight of time, the revolving seasons, and the swiftly passing months, has observed that it is very appropriate, as far as the Northern Hemisphere is concerned, that January "should be the first month of the year. Its beginning being near the winter solstice, the year is thus made to present a complete series of the seasonal changes and operations, including equally the first movements of spring, and the death of all annual vegetation in the frozen arms of winter."

Fixing New Year's Day

HOWEVER, the calendars of the ancients—the Jews, the Egyptians, the Greeks—did not place the commencement of the year at this point. It was not done until the formation of the Roman Calendar usually attributed to the second king, Numa Pompilius, whose reign is set down as terminating in the year 672 B. C. Numa, it is said, decreed that the year should commence at this time, and he added two new months to the ten into which the year had previously been divided, calling the first of the new months Januarius, in honor of Janus, the pagan god supposed to preside over the doors. Janus might very naturally be presumed also to have something to do with the opening of the year.

The ancient Jewish calendar year opened as a rule on what is now March 25, and it continued long to have a legal position in Christian countries. In England, it was not until 1752 that January 1 became the initial day of the legal year, as it had long been the initial day of the popular year.

Before that time it was customary to set down dates between January 1 and March 24, inclusive, in this way, "January 30, 1648-49," meaning that popularly the year was 1649, but legally 1648, for the legal year did not begin until March 25.

Thus New Year's Day was a movable holiday; every race and creed had a different idea and custom as to its day of visitation, and uncertainty reigned throughout the then known world. Different nations celebrated the day at various seasons in the winter, the spring, the summer and the autumn. The ancient Egyptians and Persians began the new year at the autumnal equinox, September 22, and the Greeks in the time of Solon—after whom every rural lawmaker has called himself ever since—at the winter solstice, December 21. The Romans began the year with the winter solstice until changed to January 1. The Jews began the New Year at the vernal equinox, March 22, as the beginning of the year. This is astronomically the beginning of spring and is really a logical time to begin the new year.

In 1582 the Pope promulgated the Gregorian Calendar, and New Year, which medieval Europe therefore had observed on March 25, was finally fixed for the first day of January. Catholic countries adopted the change immediately. Protestant countries were slower, and it was not until the British Parliament passed a law fixing New Year's Day as on January 1, in 1752, that the Christian world accepted it generally.

The Wassail Bowl

UNDER the Caesars, New Year's was quite a source of profit to the emperor, and became so great a burden to the people that the Christian church prohibited its members from having anything to do with the festival. The orgies which accompanied the celebration of the season not only among the Romans but also among the Teutonic races, caused the early Christians to look with scant favor upon it. By the fifth century, however, December 25 had become a fixed festival commemorative of Jesus' nativity, and January 1 assumed a special sacred character as the feast of the circumcision.

In Scotland, the change was made by a decree of King James VI, who became James I of England, when the crowns of the two kingdoms were united at the death of Queen Elizabeth. The decree of King James was issued in the year 1600, so that Scotland made the change 152 years before it was made in England, by act of Parliament, almost a half-century after the complete union of England and Scotland.

Our Teutonic and Saxon ancestors found it impossible to celebrate New Year's Day without what they called the wassail bowl. Pledges were drunk from it, and from this came the name, wassail, derived from the Saxon "wass hail"—meaning "to your health." While a man drank from the great bowl, a friend stood near with sword drawn to protect him from interruption.

In England, no holiday was considered of much account that was not observed with flowing bowl. On New Year's Eve the wassail bowl was filled with spiced ale and drunk in families, and poorer folk tied a bowl with ribbons and begged for money for ale to fill and refill the bowl, singing:

> Wassail, wassail, all over the town,
> Our toast it is white, our ale it is brown;
> Our bowl it is made of a maplin tree,
> We be good fellows all I drink to thee.

The custom of exchanging presents on New Year's Day, though in Anglo-Saxon countries it has been largely superseded by the giving of Christmas gifts, is still retained in France and the Latin countries. It is one of the oldest and was one of the most universal observances of the season.

The Persians celebrated the beginning of the year by exchanging gifts of eggs. The ancient Druids distributed as New Year's gifts among the early Britons branches of the sacred mistletoe, cut with peculiarly solemn ceremonies on the previous night from oak trees in a forest dedicated to the gods.

In France the *jour de l'an* entirely puts Christmas in the shade—indeed it is only of late years that the latter has had any vogue at all to speak of among the French. Even now it is a fashionable imitation of an English custom rather than a native-born feast. The Christmas *créches* in churches and homes are but introductions to those of Epiphany, and the *trois Mages* are usually present at the Nativity whatever chronology may say.

The old Roman customs connected with Janus (who faced both ways, past and future) and the importance of the greetings and presents on the first of January are as flourishing today as 2,000 years ago. For the Romans of old, right back in early Republican times, presented their friends with dried figs, dates, and honeycomb as emblems of the sweetness of the omens under which the year should run its course. Along with these was the *stips*—a small coin or medal which was an emblem of the good luck expressed and also a mascot presaging riches. Later this became a "tip" to one's slave or workman.

Where Tradition Lingers

IN AMERICA and England, a few close friends, the younger generation, our business servants, such as postmen, and a few domestic ancillaries profit at Christmas; but in France the whole nation takes a hand. All your friends without exception must receive your wish of *"une bonne et heureuse annee,"* and this should be done personally. A private citizen of retiring habits (not many in France) may do this with fair ease; a business man with customers added to his own and his wife's relations has a harder task; while a public man of any distinction, even local, has any number, from hundreds to thousands, who *must* be remembered.

Fortunately, Dame Convention allows this to be done by deputy, and you may suitably inscribe your cards, send them around by a hired distributor, and peacefully remain at home. After the late war this custom was allowed to assume reasonable proportions, but in France all ceremonious traditions have a tough life, and today this "calling" duty is as binding as ever.

The New Year's present duty is just as rigid. Presents must be given, for instance, to all your employes. Hundreds of employers have to stand for hours receiving the handshake and *"Bonne annee"* from expectant workmen and return the wish with a *"Pareillement, Jules,"* or *"Pareillement, Gaston,"* together with an envelope containing a gift exactly proportionate to the importance of their duties. It is an opportunity of displaying considerable tact in deciding the precise position in the heirarchy of labor of the man who sweeps up the refuse and him who carts it away.

These New Year's gifts are called *etrennes,* and the derivation of the word indicates the antiquity of the custom. The ancestor of *etrenne* in historic times is the Sabine word *strena,* meaning health. It is a common word in republican times when it means any omen, generally of good luck.

"First Footing"

IN SCOTLAND, as in France, New Year's Day outshines Christmas as the most important festival of the year. A visitor whom every family expects on New Year's morning is the "first foot," a name given to the person who first sets foot over the threshold after the stroke of twelve.

At the principal Russian cities, under normal conditions, New Year's is celebrated according to the rite of the calendar of the Greek Church. The favorite form of gift appears to be bric-a-brac. Under the pretext of sending bonbons, men pack the candies in the most exquisite caskets of Saxe or Sévres porcelain, or else in boxes made of that beautiful enameled silverware for which Russian jewelers are justly famous. After the restoration of the Bourbons in France, it became fashionable to send bonbons on New Year's Day, and 1,000 tons of them, in 1822, were sold in the two days preceding the festival.

In Japan, the New Year is a season of much festivity and innocent mirth. Every portal is decorated and each object of which the decoration is composed has a symbolic meaning. The usual form of the decoration is a green arch. On the right is placed a small pine tree with a reddish stem, and on the left one with a black stem. Fancy has attributed to the light one a feminine and to the dark one a masculine sex. Also, this hardy tree symbolizes a stalwart age that has withstood the storms and struggles of existence. Close to the pines on either side are set graceful stems of bamboo, which, rising erect with succession of rings, form a fit symbol of hale life and fullness of years.

The distance between the trees, about six feet, is spanned by a grass rope sufficiently raised to admit of passage beneath it. This, according to its symbolic purpose, debars all unclean and evil things from crossing the threshold. Among the Chinese, New Year's Day is the greatest festival of the year, while in many countries it receives greater attention than even Christmas.

From old Dutch times to the middle of the nineteenth century, New Year's Day in New York City was devoted to the universal interchange of visits. Every door was thrown open, and it was a breach of etiquette to omit any acquaintance in the annual calls; when old friendships were renewed and family differences amicably settled.

Former Days in Old New York

AT THIS period there were great feasts spread in many houses and the traditions of tremendous Dutch eating and drinking were faithfully observed. Special houses were noted for particular entertainment; at one, pickled oysters; at another, boned turkey or marvelous chocolate or perfect coffee. At all houses there were New Year's cakes in the form of the Egyptian cartouche.

It is quite possible that the custom of the Presidents, from Washington to the present, to receive on New Year's Day, was established by these early Dutch festivals. In 1790, when New York City was the seat of our government, President Washington held a reception between noon and three o'clock, and was visited by all the home and foreign dignitaries. He expressed the hope on that occasion that whatever change might take place in the manners and customs of the city, the observance of New Year's Day might never be abandoned. In New York and many other cities, there are services in many churches and receptions in clubs and drawing rooms. The good Knickerbocker custom is still maintained by some families.

However, slowly there followed the gradual breaking down of the old lines of conventionality into a wild riot of visits. New Year's Day took on the character of an untamed race against time. A procession, each of whose component parts were composed of two or three young men in a barouche, with a pair of steaming horses and a careless driver, would rattle from house to house all day long. The visitors would jump out of the carriage, rush into the house, and come out in a few minutes. The ceremony of calling was a farce. There were hilarious greetings, a bite to eat, everybody shook hands all round, and the callers dashed out and jumped into the carriage and were off to the next house. However, after a few years thus the custom was abolished.

New Year in New England

THE sole record of the observance of the New Year by the Pilgrims in the New World named New England was most prosaic, most brief—"we went to work betimes." Many of the good Puritan ministers thought the celebration of the day savored of improper and un-Christian reverence for the heathen god Janus. Yet these English settlers came from a land where New Year's Eve and New Year's Day were second in importance and in domestic observance only to Christmas.

For centuries it has been the custom, at least among northern nations, "to see the old year out and the new year in" with the highest demonstrations of merriment and conviviality. To but a few does it seem to occur that the day is a memorandum of the subtraction of another year from the little sum of life.

An old writer records: "With the multitude, the top feeling is a desire to express good wishes for the next twelve months' experience of their friends, and to be subject of similar benevolence on the part of others, and to see this interchange of cordial feelings take place, as far as possible, in festive circumstances."

The poet Longfellow, in one of his prose works, has given advice as to the attitude to take, respecting the flight of time of which all are so forcibly reminded by New Year's Day. He writes:

"Look not mournfully into the past. It comes not back again. Wisely improve the present. It is thine. And go forth to meet the shadowy future without fear and with a manly heart."

The Old World custom of watch-night meetings and of sitting up to see the old year out and the new year in is now perhaps, here in the United States, more general than elsewhere in the world. Indeed, New Year's Day is our second holiday, as it has been man's festival day since remotest times.

Seeing Our Friends When Thousands of Miles Away

By S. R. WINTERS

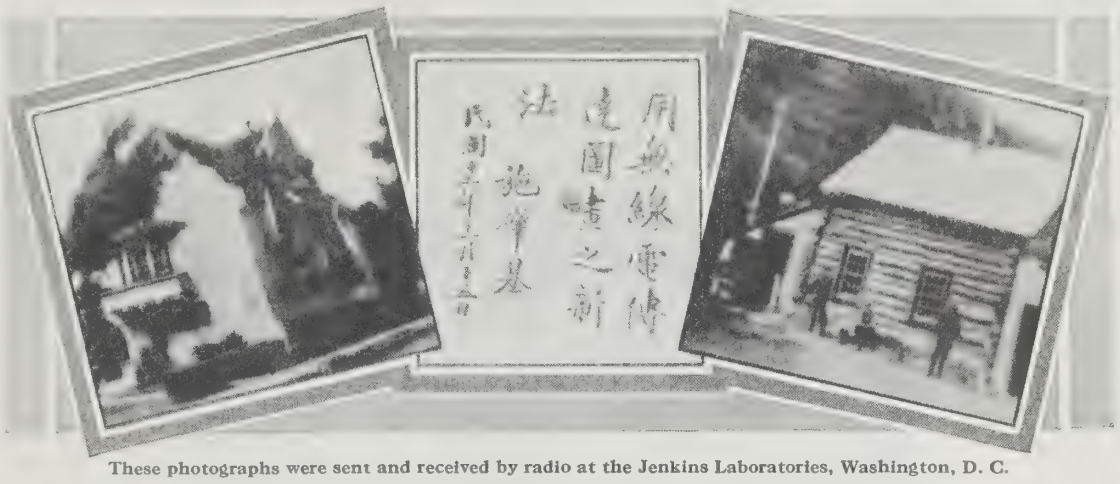
PHOTOGRAPHY is the most rapid means of copying, and radio the swiftest in travel. We've hitched the two together. The apparatus is essentially a long camera with the lens in one city and the negative plate in a distant city.

Almost anything that can be photographed with an ordinary camera can be photographed by the radio camera. Photographic copies of portraits, photos of messages and news copy; of persons, of outdoor scenes, and so forth.

It differs from ordinary photography in this respect, that being a broadcast phenomena instead of directed, a thousand radio receiving cameras, in a thousand different places, can make a thousand negatives of the thing the broadcasting lens is looking at.

Have you never put a nickel under a piece of paper and by drawing straight lines across it with a very dull pencil made a picture of the Indian appear? Well, now, that isn't so very different from the way we do it. In place of the crayon pencil we draw lines across the white surface with a pencil of light, the image of a small light source of high intensity and high frequency.

The photograph to be radioed is caused to move across a light-sensitive cell in successive imaginary lines. The lights and shades of the photo are thus converted into electrical values, which are then broadcast on a radio carrier wave.



These photographs were sent and received by radio at the Jenkins Laboratories, Washington, D. C.

At receiving stations the incoming radio signals are changed back into light values and put together in lines on a photo plate.

When this negative is developed prints are made therefrom which are duplicates of the photograph at the broadcasting station.

As the still camera and the motion picture camera differ only in speed, it naturally follows that when the radio camera is speeded up motion pictures are obtained.

Motion pictures and radio vision (the ability to see by radio what is happening in a distant place) are right now a matter of daily laboratory demonstration.

The telescope enables us to see to great distances, but only along straight lines; and as straight lines only lead away off into space, the telescope is limited to a study of the stars.

Radio vision, however, enables us to see to great distances along curved lines. Therefore we may see around obstructions, over mountains, perhaps ultimately around the earth.

Our President may then look on the face of the King of England, as he talks with him; or upon the countenance of the President of France, when exchanging assurances of mutual esteem. A portrait of President Coolidge has already been received from London in twenty minutes.

The chiefs of staff of our Navy and Army may see at headquarters all that a lens looks upon as it is carried aloft in a scouting plane. And from our easy chairs by the fireside we stay-at-homes can view the bleak terrain below as the broadcasting lens is carried over the North Pole in a great ship like our *Shenandoah*.

In due course, then, folk in California and in Maine, and all the way between, will be able to see the inaugural ceremonies of their President, in Washington; the Army and Navy football games at Franklin Field, Philadelphia; the struggle for supremacy in our national sport, baseball; and both see and hear grand opera broadcast from anywhere. Incidentally Mr. Jenkins is the inventor of the first motion picture machine, the prototype of the projector in every theater the world over, and a Franklin Institute medalist.

Transmitting news copy by reducing the copy to a long succession of dots-and-dashes, right in 1840, seems terribly antiquated today.

Photographing the copy sheet by sheet is much quicker, is authentic, is in original characters and native language. It may also include explanatory sketches.

The instruments are simple and rather inexpensive, and, like a loud-speaker, can be attached to any standard radio receiving set.

I am sometimes asked how our method differs from the method of the many others who have attempted to send photographs by radio. This is it. Like an artist we fasten the paper to an easel and move the pencil to make the picture, while the others hold the pencil still and shift the paper about under it, a rather illogical method, involving difficulties never yet successfully overcome.

Yuletide Annuals Our Grandsires Read

Concluded from page 2

period between 1830 and 1850 was a period of intense sentimentality, and there was a great deal in it reflected in these annuals, which today would excite our derision and which—as we shall see—excited the derision of writers even of that day and generation.

To begin then, almost at the beginning, or at least when the annuals were in full swing, here are a few titles and dates:

The Keepsake for 1829. Edited by Frederic Mansel Reynolds, 8vo, pp. 360. Eighteen plates, London: Hurst Chance and Cox, and R. Jennings.

The Bijou: an Annual of Literature and the Arts, 12mo, pp. 288. Ten plates, London: W. Pickering. For 1829.

The Winter's Wreath for 1831, Whittaker's Friendships Offering, a Literary Album and Annual Remembrancer. Smith Elder & Co.

The Humorist, a Companion for the Christmas Fireside. By W. W. Harrison, author of "Tales of a Physician." Ackerman.

Ackerman's Juvenile Forget-Me-Not, a Christmas, New Year's and Birthday Present, for Youths of both sexes. Eleven plates.

Note. ("For youths of both sexes" would be a large order for this present 1924.)

The Juvenile Forget-Me-Not, a Christmas and New Year's Gift, or Birthday Present for the year 1831. Edited by Mrs. S. C. Hall, 12 embellishments, 12mo, pp. 224, London: Westley & Co.

Now if we think there was no critical reviewing in those days, the illusion must be dispelled at once. Meade Minnegrode, in his interesting book on "The Fabulous Forties," recently published, mentions a number of the annuals and other periodicals, but, unless I err, fails to include the *Monthly Review.* I should like to know who wrote the critical articles for that periodical. He may have been one of our most eminent writers. And this is what he says, in part, about the annual which heads our list, the *Keepsake* for 1829. Sir Walter Scott evidently had something to do with it. (He contributed "The Laird's Jock."):

"The choice of subjects may perhaps in some instances be questionable. We do not, for example, think 'The Laird's Jock' entitled to any praise . . . . although the design was suggested by Sir Walter Scott. Neither can we applaud the 'Scene at Abbotsford' consisting as it does of a pair of worn out old dogs and a confused pile of helmets, armor and harness. The design of the print in which the mother is represented on a declivity by the sea side maddened with agony, requires to be described by the story before we can understand it, for we see nothing at all of the sufferers, or the persons destined to be their protectors."

He then goes on to say:

"We have had occasion frequently to remark, that writers of distinction, the Campbells, the Southeys, the Scotts, the Coleridges and the Wordsworths who, on most other occasions, have maintained their early reputation, have been almost uniformly immeasurably beneath it, in the compositions which they have contributed to the annuals. But if Mr. Heath's embellishments have derived little assistance from the first literary names of the day, he has been still more unhappy in his choice of authors, hitherto unknown, whom he has called into requisition on this occasion. Foremost amongst these stands the editor, a Mr. Mansell Reynolds, of whom, though not altogether unacquainted with the secrets of modern English literature, we do not recollect ever by any chance to have heard before!

"As a straw thrown up in the air indicates the direction of the wind, we looked in the first place into the preface of this edition in order to discover if possible the marks of those talents for which he has given himself credit. Upon glancing over it, we must say we blushed for the literature of the country."

I have referred to the fact that many of the annuals were written by the most famous writers of the day. These included not only Thackeray and Dickens, but Byron and Southey, Miss Mittford and the Howitts, Tom Hood, Barry Cornwall, Haynes Bayly, Mrs. Norton, Mrs. Abdy, Praed, Charles Swain, and even Macaulay. Among the artists represented were Turner, Clarkson Stanfield, Stothard, Sam Prout, J. Skinner Prout, Martin, Frank Stone, Westall, Wilkie, Mulready, Landseer, and many others. Some of the names given to the annuals were Tokens, Atlantic Souvenirs, Landscape Annuals, Gems, Oriental Annuals, Books of Beauty, The Pearl, The Amethyst, and others. In America some of the writers were Catherine Sedgwick, Hawthorne, N. P. Willis, Percival, Peter Parley, Lewis and Willis, Gaylord Clark, Isaac McClellan, Fitz-Greene Hallack, Grenville Mellen, President John Quincy Adams, and maybe Edgar Allan Poe. There were many stories. Besides "The Laird's Jock," which Sir Walter Scott wrote for the *Keepsake,* he also wrote "My Aunt Margaret's Mirror" and "The Tapestried Chamber."

Perhaps the annual was at its best in 1830. From then on it slowly declined. The great authors grew tired. It was somewhat later—about a decade—that Charles Dickens made his memorable experiment with his "Christmas Carol." This, best of all Christmas annuals, was ushered in by its author with many pains. He had expected to make a thousand pounds out of it. His "yearly bills" pressed heavily upon him. "I really believe," he writes, "I should never get up again, until I had passed through all the horrors of a fever. I found the *Carol* accounts waiting for me, and they were the cause of it. The first six thousand show a profit of £230 . . . . My year's bills, unpaid, are so terrific . . . ." But the letter is too painful to continue. Suffice it to say that, in the end, Dickens realized all any author could hope for from his Christmas masterpiece.

"The True Noel"—The Waits, a scene in the fifteenth century.

Where Youth Lived Riotously on 30 Cents

"Red Ring" Around Post-War Germany When It Is Drawn From the Inside

By DAVID STEWART

In the issue for July 5 there appeared an article by H. H. Allen entitled "A Red Ring Around Germany." The writer of the following shows us how the "Red Ring" might be drawn from the inside.

IN NOVEMBER, 1922, a small boy of St. Joachimstal, a German town of Northern Czecho-Slovakia, was intrusted with four letters destined for America. Czechish stamps were attached to them; but these he steamed off, and sold for their face value, 10 crowns (30 cents). Then he disappeared, and for two days nothing was heard of him. Anxious parents and wondering officials traced his path over the German border, and he was found in Oberwiesenthal, Saxony, sleeping off the effects of the one mad debauch of a youthful lifetime. In Germany he had sold the 10 crowns for 3,000 marks, of which only 60 had been required to forward the letters, postpaid and *registered*, to the United States. With the balance, he had taken a room at a good hotel and proceeded to "go the route." Nor were his funds by any means exhausted, when he was interrupted and taken home.

Exactly one year before this time, when the Austrian crown toppled, an equally brilliant stripling, dweller in one of the Tyrol villages awarded to Italy by the Peace Treaty, slipped by the frontier guards and armed with about a dollar's worth of Italian money, descended upon Lienz. The value of exchange had risen; prices, out of regard to the ability of a local population to buy, had not. He went on an orgy of spending, threw money in every direction, and ended by raiding and almost buying out a pastry shop. Nearly suffocated with an excess of tarts, from the shop he carried a large pail of cream-puffs to a cow which was grazing nearby, and which he recognized as an old friend.

"Das arme Kuehele soll auch 'was haben," he remarked to an astonished bystander. And though scurvy, rickets, and acute malnutrition prevailed among Viennese children, the "poor cow" got her bucket of cream-puffs.

These incidents, ridiculous as they are, serve to illustrate Germany's (and Austria's) extreme defenselessness throughout the period in which mark and crown were on their way from pre-war values to those of the present day. From June 12, 1922, when the dollar rose over a quotation of 300 marks, until November 30, 1923, when it reached sixteen trillion, the former country almost uninterruptedly was open to depredation without parallel.

After the summer of 1922, it became generally known in Europe that foreign bank notes had an artificially high purchasing power in Germany. From that time on the land was overrun by thousands of foreigners, most of whom took extensive advantage of the anomalous relation existing between exchange and inland prices to live cheaply there, and literally to grow fat on it.

On January 31, 1923, the French occupied Essen. Ex-

Student shoe-repair shop in Tubingen.

change, which on the third of the month had been quiet at 7,260, broke to 51,000. In consequence, a private in the departing American Army had for the moment a salary more than equal to that of the entire German ministry. On the evening of the same day, two American students at the University of Berlin changed a dollar and went out to see how long it would take to spend it.

At the opera they obtained orchestra seats, and witnessed an inspired performance of "Lohengrin." Then they taxied to Traube's, the best wine restaurant in Germany. There they ate roast goose and drank two bottles of the best German champagne; were occupied, in fact, until midnight, but the money still held out. On their way home, after visiting a café and stopping at a bar, they gave up in disgust, and decided to throw such small change as they had left to a group of street urchins in the Friederich strasse. This amounted to approximately a thousand marks; a sum which, when thrown into the gutter, produced what threatened to become a riot.

With conditions such as these prevailing, it is not astonishing that foreign visitors came in from all directions. "Something for nothing," is an attractive lure in any section of the world; and if not for nothing, Germany had something for very little. Railroad fare was the most negligible of all considerations; a second-class ticket from Aachen (Aix-la-Chappelle) to Konigsberg in East Prussia, a distance of 800 miles, cost 75 cents. All other fares were proportionally high, and it actually was impossible, without doubling on one's path or traveling first-class, to spend as much as a dollar on a single German railway ticket. The influx which followed was as irresistible as its consequences were inevitable.

"The man at the bank forgot to sell my $20 on Wednesday, and on Thursday the dollar was up so high that I nearly bought out a leather-goods store with the difference," was one man's reason for making extensive purchases. With many, however, the exploitation of German retailers was as lucrative an occupation as that of the present-day American bootlegger.

In Constance, where John Huss was burned, a cake of milk chocolate cost the equivalent of 8 centimes on the same day on which it sold for 80 in Kreuzlingen, half

Working students in their kitchen.

a mile away in Switzerland. Within 24 hours the German price had risen 300 per cent, and then there was no more on the market. In cities and villages near the Dutch and Danish borders, German prices for butter, which at all times were beyond the reach of persons with average incomes, varied between 75 and 25 per cent of those in Holland and Denmark. In the face of local shortage, the butter-runners kept prices soaring, and, consequently, milk in any form was to be had only by the rich.

In Prague, capital of Czecho-Slovakia, an imitation-leather suitcase sold for 150 crowns, while at the same time 100 would purchase one of the best sole-leather in any German city; and a suit of clothes cost so much more in Czecho-Slovakia than it did in Germany, that for a time tailors in the former country were threatened with bankruptcy. The situation in Flensburg, Schleswig, was typical of that in many border cities. Habitually the place was overrun by Danes at mealtime, because food there cost less than a third as much as it did across the line in Denmark. In self-defense, most border districts had to keep their prices 30 per cent higher than those inland.

At times, the relation between retail prices and exchange became so false, that it was impossible even for foreigners to make purchases in Germany. A week after the Ruhr break, neither eggs nor butter were to be had on the Munich markets, though the hinterland on which that city draws is the strongest agricultural section of the country. Tyrolean peasants had cornered the supply with Austrian money, and with the marks they had left behind them, the retailers were unable to buy even an appreciable fraction of their former stocks.

In November, 1923, with exchange demoralized and chaos threatening because of the Rheinland revolution and the Hittler "Putsch," prices rose *700 per cent* in a single week, and because of the worthlessness of German money the bakers refused to sell bread. Unless prices automatically were increased with the dollar quotation, everyone who sold during a rise of exchange did so at a certain loss; and the price of bread was fixed by the government.

It has been said that the purchases made by foreigners in Germany were of negligible effect, because of a law which forbade the taking of new articles out of the country. This statement deserves just as much respect as one that there is no liquor in the United States, because its manufacture, transportation, and sale are forbidden by American law.

During eighteen months of almost uninterrupted depreciation of the mark, thirty-one express trains a day carried between 600 and 2,000 foreigners each out of Germany and into the nine countries adjacent; each of which had a stable currency. Throughout this time all international trains were crowded; after the shortage of Ruhr coal had set in many of them were so overfilled that access was impossible. Customs revisions seldom lasted more than half an hour. As far as personal baggage was concerned they were a total farce. In crossing German boundaries fifty-five times (at every railroad point) the writer saw export duties levied only twice, and but a single case of confiscation.
